NOV. DEC
1912

THE BUILDER

AN : ILLUSTRATED : WEEKLY
MAGAZINE : FOR : THE
ARCHITECT : ENGINEER : AR-
CHÆOLOGIST : CONSTRUCTOR .
SANITARY - REFORMER : AND
ART-LOVER.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private principedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"OUR English word To BUILD is the Anglo-Saxon Bylġan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

OFFICE: CATHERINE ST. STRAND LONDON W.C.

INDEX TO VOLUME CIII.

OUR REGENT'S QUADRANT COMPETITION.

WHEN we originally contemplated promoting a competition for designs for the completion of the Regent's Quadrant façade, we confess that whatever our hopes may have been we hardly ventured to anticipate so wide a response to our invitation. That 138 designs have been submitted is naturally, therefore, a source of gratification, as it seems to show that our effort to interest the profession in the solution of a most difficult problem has not failed of its purpose.

This problem of the architectural treatment of the shop front in harmony with modern requirements is one of the first importance, yet it is, we think, too often shirked, and as far as possible evaded by those who are called upon to deal with it. Instead of accepting the practical conditions and requirements with enthusiasm, and from them drawing inspiration for characteristic and

expressive designs, as did the architects of all the great periods of the past, modern designers are too apt to look upon them as restrictions which, conflicting with their preconceived ideas and with the architectural conventions of the moment, tend to paralyse their efforts.

Under our present code of building laws, and with our present building methods, any such logical solution of the treatment of shop façades as was foreshadowed by Viollet-le-duc, and has since to some extent been realised here and there on the Continent, is for the time impossible, but even under our present conditions there is much to be done, if only the subject can be approached sympathetically.

At the root of the whole matter, no doubt, lies the question of town planning—the proper location of buildings, such as shops, which need a special architectural treatment. If all buildings were placed in accordance with their relative

importance in the life of the community, half the difficulties would disappear. In this particular case the town-planner may well take the view that, although drapers' shops are necessary to the community, they are not of such outstanding importance as to demand the angle site at the junction of the two most important West-end thoroughfares in London dominating an important open place containing such semi-public buildings as a theatre and a music-hall.

He might think that the relative importance of the shop would be sufficiently expressed and its practical necessities sufficiently provided for by a frontage in some less dominating position.

This angle seems to call for a feature of some strength, and if the whole district were replanned it would probably be reserved for a public building, or at any rate for one of a character which naturally demanded sufficient solidity of

treatment. To place here a building which naturally demands a glass base would seem, from this point of view, to be deliberately looking for trouble, and we are inclined to the opinion that in a well-organised town such a problem as here confronts us would never be allowed to arise. We are aware that every trade in London would like to occupy such a site, but it is difficult to imagine a town-planner allocating it to one more than to another.

We suppose it is generally recognised by most architects that in a shopping street the shops should predominate and give the characteristic note, and that the buildings above them should be kept quiet in treatment to serve as background or foil to the rich and varied display in the shops, and to the colour, life, and movement, and human interest in the street itself. Here the points of view of both architect and retail trader seem to coincide, or at least to present no absolute contradiction, and on some such general principle there should be no special difficulty in creating a façade which should be satisfactory to both parties, as long as no attempt was made to erect it in a position where its characteristic treatment would be out of place in the general scheme of the city.

Had this been all that was required here, there would have been no need for our competition, as the only special difficulty would be the treatment of the finish to Piccadilly-circus. The special problem that excited our interest was the possibility of creating a characteristic shopping façade in harmony with one which is not generally considered characteristic.

Our readers may remember that in announcing our intentions we asked for "an architectural design that, while accepting the present façade as a *fait accompli*, shall continue it in such a fashion as may not be open to the destructive criticism that has been levelled at Mr. Norman Shaw's design," while the terms of the competition stated that it was "for designs suggesting a façade in harmony with the Piccadilly Hotel, but giving more consideration to the requirements of the retail trader."

This, then, was the problem, and it is for the assessors to say how far any of the designs submitted afford a reasonable solution.

Nothing is more interesting than to notice the different ways in which the terms of the competition have been interpreted. The designs range from those which continue the treatment and features of the Piccadilly Hotel, with a consideration for the retail trader which is well-nigh infinitesimal, to those which practically ignore the hotel and proceed as if it were not in existence, aiming at a harmony of general effect. Broadly speaking, perhaps, it might be said that all those who have made a genuine attempt to solve the particular problem involved may be divided into two classes which appear to have approached the problem from opposite directions. On the one hand are those who start with the hotel and endeavour to carry on the same style and character so far as consideration for the retail traders will permit, and on the other hand those who start to design a suitable shop façade

for Regent-street, making such concessions as they felt necessary to bring it into harmony with the hotel.

As the majority of the competitors might perhaps be expected to consider any exact reproduction of the style of the present building to be a restriction which fettered the free expression of ideas, it is not altogether to be wondered at that, generally speaking, the more interesting of the designs are those in which the author has allowed himself as free a hand as possible, and has trusted to obtaining a general harmony by other means than the literal retention of the style and features of the hotel.

From the retail traders' point of view we understand that the objectionable features of the present design are the ground-floor arches with their deep reveals, the great depth of the entablature, the heavy cornice, and the loss of space and light involved in the recessed frontage on the upper floors. In dealing with such features many nice questions must have arisen capable of being looked at from many different points of view. How far the traders should be expected to make concessions to the general appearance of the street, or how far such features can be altered while preserving a reasonable degree of harmony with the present façade, are questions which each competitor has answered for himself.

In fact, this competition appears to have been a most useful exercise in the art of adjusting conflicting interests under circumstances somewhat different to those which usually obtain in the daily routine of an architect's practice—an exercise in artistic judgment rather than invention. We feel confident also that it will not be without its effect in bringing home to those who have not hitherto given much consideration to the matter that every street should be treated in accordance with its character, and that guiding principles can be evolved which are applicable in every particular case.

We offer our heartiest congratulations to the winners, and our thanks to the assessors, and to all those who have contributed to the success of what we believe will prove a most useful competition. We hope next week to illustrate some of the selected designs, and to make further reference to the exhibition now on view in the gallery which the Architectural Association have kindly placed at our disposal. Our indebtedness to the Association is further increased by their courtesy in allowing the drawings to remain on exhibition till 6 p.m. on Wednesday, 10th inst.

THE INCORPORATED CHURCH BUILDING SOCIETY.
The Secretary of the Incorporated Church Building Society, 7, Dean's-yard, Westminster, has received a bank-note for 1,000l. from an anonymous contributor.

NOTABLE LONDON HOUSES FOR SALE.

Some notable London houses have just been placed in the market. The category comprises No. 14, Melbury-road, Kensington, built for the late Colin Hunter, A.R.A., after designs by J. J. Stevenson; Lovthor Lodge, Kensington Gore, by Mr. R. Norman Shaw, R.A., for the late Hon. William Lovthor; Nos. 125 and 125A, Mount-street, Grosvenor-square, by W. H. Powell, F.R.I.B.A.; J. M. Whistler's home, No. 74, Cheyne-walk, Chelsea, by E. W. Godwin, F.S.A.; and Dudley House, Park-lane, the residence of William, Lord Ward, first Earl of Dudley, which his son, the Hon. John Ward, has purchased from Sir J. B. Robinson.

FIRST CAUSES.

IT is well sometimes, not "on occasion" but on no occasion at all, and even in the press of practical actuality, to draw little aside and wonder what, after all, we are doing in this matter of architecture besides, with more or less success, gaining our livelihood thereby. The danger of becoming too enamoured of contemplation, of abstract inquiry, as well as of the inhibitive tendencies of its too anxious prosecution and partial results, is not one which unduly besets us as a race, although it undoubtedly exists. What success we have, in a world of doubt and experiment, is to a great extent due to our instructive avoidance of these perils, and what failure and meagreness of achievement we must confess to as artists and, to be particular, as architects must be ascribed in a determining measure to that self-same characteristic attitude of our minds. For a great architecture is the product not of the moderation, which is our boast, but of steadfast temerity and a sort of passionate patience, rather than of our customary rule, not "of thumb" even, but of expediency. That rule of procedure has enabled us, in other directions, to do so well in disordered situations and in times of dissolutions and untried beginnings, such as the century past is now being realised to have been.

To do so well indeed, in the hurly burly, that we must sometimes, architects especially, because not only their pleasure but their profit also is concerned—must sometimes surely sit back wondering, and inquire, not with petulance, but musingly, how it is that the arts and architecture also have not prospered more than they have. We are doing better; we have in cases done well; but have we, we architects, done proportionately well? And we can but admit that, taking us all together, we have not. We know, each one in his own case, that given the conditions we suffer we could not have done much otherwise; that given some other conditions we would have done much better. It is not inability alone, we feel, that holds us from some realisation, a little more nearly complete, of our dreams. And if we will analyse our troubles we discover that they all, in as far as they lie not within ourselves, have their root in the mental attitudes of three sets of persons—since persons form, alas, the bulk of the medium in which we have to work!—our clients, that is to say, our craftsmen and those varieties of persons in the mass, the public authorities. But this amounts to all our environment, if we except for the moment the ever-present Past. And we have come to the conclusion that good architecture (we will not think yet of great architecture) is rendered difficult by the condition, mental and spiritual, of all our countrymen, of the whole race: in which aggregation the inquirer is a unit, so that it is possible, as far as most of us are concerned, that even were the circumambient conditions ever so otherwise. . . . But we do not pursue further the exasperating vista thus disclosed. We rest tired and discontented on our great conclusion, wording it, in our curious language of *chichés* and phrases: "That in the onrush of

material progress the Arts and Graces tend to be left behind," or something, if what one sees written is anything to go by, like that.

Now, as in many other cases in these days, when we are so content with extraordinarily slipshod expression—that contentment itself being a symptom of our condition which must disappear before fine architecture comes once more amongst us—our ready-made phrase about the advance of material prosperity was as wrong in all its implications as the conclusion, on which we thought it based, is inevitable, indubitable, and right. Our phrase implied that material prosperity was, and is, the cause of our falling off—the two phenomena being contemporary as regards, at any rate, their inception—and, further, that it always was so. It is, too, possibly a soothing thought that we are only paying for what, as compensatory purchase, we undeniably have—a great measure of material comfort; and that, through no fault of our own, but by the operation of a cosmic principle, our work is not as good as it might be, or as we could make it, were we not otherwise so exceptionally favoured. Even this shred of support, however, and cushion of resignation, a glance at the course of history will destroy for us. Athens of the great age of Pericles offers economically a very close parallel to this country to-day. Rome grew in wealth and appreciation of art as she expanded materially and in empire. Florence was never so great in either art or commerce as when she was strongest in both. Venice, too; and even this country at various times. Consider East Anglia when the wool trade and the building of great churches went together, and wonder if, after all, the unprecedented ugliness of much of the building to-day, which seems to delight the vulgar, may not be strangely beautiful.

Yet we know it is not so. We know that it has been called all the despairing names with reason; that there may be others perhaps worse still in store. So we must abandon our indictment of material progress. That alone is plainly not to be blamed. Where, then, for we are thrown back upon our first conclusion that all is not as it should be with the conditions of our time, is the seed of misfortune? We turn to the sociologists; they have their answers. We go to the economists, to the politicians, and to all the sects of reformers; they all have their replies, contradictory very often, and ready, easy cures. But none of these appear to have sufficient bearing upon the condition of architecture, the object of our solicitude. All the things they say are wrong have been just as wrong at one time or another, at one or more of the great periods of the art, or can with little difficulty be paralleled. The sects themselves, big and little sects, as we inquire more deeply and variously, show but as symptoms of the trouble; and their very plentitude, far from being hopeful, seems almost to constitute the disease. Thus, although we found that our inhibitive conditions lay all about us and beyond our control, we can discover nothing to our purpose by looking round save that in other walks, as in our own affairs, there is a great searching of

hearts and apparently, if we may judge by results, little to be done.

In some few directions certainly modernity thrives and finds possibility of advancement. Do we unduly perturb a quiet soliloquy by breathing the names of these so alien notes? Cinematograph, aviation, aero-telegraphy—dare we mention them? And motor-cars, all swifter means of transit—*motor*! That is the basic theme—change, departure, speed, and somehow *motion*—all surely inimical to architecture—architecture that has been defined as "building for eternity." But is there nothing new to building, too, nothing which will enable us to do differently, to enjoy, or labour under, possibilities not held out to any age but this? Perhaps we find one. It is only a system of construction, made possible by modern knowledge and the manufacture of steel, at least, by so much therefore, ours alone. It is known as useful in certain situations, especially in those of what we are in the habit of calling a "purely utilitarian" nature. But it often also now underlies an innocent-looking floor, makes possible any very dubious arch, and fills with hidden sap and strength the stale old lines and detail of some overburdened columnar support.

All to what end? That we may build to greater scale, cover more space, enclose more atmosphere? That sounds so crude and quantitative and like the talk of these times. But build more daringly, too, and to the utmost, once again, of our power and skill; and so express the age which is upon us. For what do we think of that age as doing for us, materially only, since none can tell its effect upon the soul of man? Will it not, has it not already, made the world smaller, lessened the distance between man and man, or, as we put it, bombastically, "annihilated space"? And the new building, will it not do yet a little more to decrease the dwindling stature of man himself?

Maybe; but what's all this to us? Motion, rhythmic motion, speed and time, dimension, and space—and the diminishing of cubits. . . . Let us leave these realms before we be utterly lost. Never forgetting though—has it been known for centuries?—that it was not because they had ten realms and of Muses only nine (in a mystic square) that Urania of architecture also had for her own the rhythmic measured movements of the stars. It is well to remember that; and yet, to have pressed our inquiry so into the future, in order to vanquish despair, avails us little in the matter of our asking, what, after all, we are about.

Why, to question our great postulate even, does architecture exist; why in all its history should the forms we take for granted be so interesting and why so diverse? Why should we trouble to give to building—for we do trouble and strive unceasingly—any form at all beyond that positively required by practical necessity? Surely not for the eye alone: as well might we say that doorways are made just for the pleasure it gives us to pass through them. There is so little really, if there be anything, for the eye's delight and nothing else—the eye being merely, as has been said, the window of the soul. So that it would be

as if, going back to that hard metaphor of the door, as if the door were to be pleased by our passing rather than opened to our need. Let us take a piece of the purest decoration—anything will do—so that it have not the remotest hint of a "meaning." Do we not find even with this that it gratifies the eye only in that degree in which that eye is informed by the intellect behind it?

No; that way will not do. All our eyes are much the same, yet the foods we desire to feed them with are so diverse. "Eye alone" proves an answer that turns upon us only to reiterate our query. But if we substitute the use and wont of the eye and say that our vision grows to love for its own sake the forms to which it is accustomed? Why, then, do those forms ever change? Does not that hypothesis imply one habit of our mind, one custom slowly turning through the ages?—a thing unknown except perhaps in China. No; forms have changed more rapidly than can be accounted for by that reasoning. We may object that the forms of buildings do, or should, express their purposes, and so do differ, alter, and progress. But, although the objection is irrelevant, since we are thinking of the forms which constitute "style," common to all the buildings of a period, that is not so either. The plan and grand outlines of a Hellenic temple and a Gothic minster are very different, although their purposes were, it would seem, sufficiently alike to render their forms substantially the same. No one ever denies the difference. But we are now seeking the reason; for if we find anything, it will tell us something helpful perhaps to our quest—our quest of the cause, not so much of the difference between the Parthenon and the cathedral at Amiens—shall we say?—as of our inability to make the best we can do to-day—let opinions differ as to what that may be—anything but indubitably inferior to either.

NOTES.

A Suggested Whitehall Improvement

WE publish in another column a letter and plan we have received from Mr. E. Howley Sim with reference to our scheme for a Whitehall Improvement. The position of the proposed new building, as given on this plan, ignoring, as it does, the frontages to both Whitehall and the Embankment, certainly appears to render some protest necessary, and we quite agree with Mr. Howley [Sim] that the matter might be seriously considered by the Institute and representations made before it is too late. We presume such a matter as this would come within the province of the Town Planning Committee, and if they are not already taking action we commend it to their attention.

Lambeth Bridge.

THE report of the Improvements Committee of the London County Council that the Committee are now considering what action to take with reference to the rejection by Parliament of the Council's Bill for the reconstruction of Lambeth Bridge raises a point of some interest. We think it was generally understood at the time that, apart from some traffic

objection to the proposal for a narrower bridge than had been originally contemplated, there was a certain underlying feeling that the design was not altogether worthy of its position in close relationship to the Houses of Parliament and to the centre of National—or even Imperial—life, and that something better was desirable from the Imperial point of view. We are quite of opinion that if London is to be allowed to reap the profits and enjoy the dignity and prestige of the capital of the Empire she must be prepared to live up to her position, to shoulder the corresponding responsibilities, and to carry out her improvements in a befitting manner, but, all the same, there must be a limit to the burdens which the Empire can rightly place on the backs of the London ratepayer. Without expressing any opinion on the merits of the Lambeth Bridge scheme it would seem only reasonable, as a general principle, that where improvements have, for Imperial reasons, to be carried out on a much larger and more costly scale than would suffice for the reasonable local needs of the town, the Imperial Exchequer should make some contributions to this extra cost. After all, the obligation to provide and maintain a city which shall be a worthy capital for the whole empire is not entirely confined to those who happen to make their living in it.

The Advertisement Nuisance.

We are pleased to see that the London County Council appears to be making a determined effort to deal with some aspects of the advertisement nuisance by proposing by-laws under the Advertisement Regulations Act, by which no advertisement will be allowed within sight of 108 open spaces which have been scheduled by the Committee. It would be interesting to know what principles guided the Committee in their selection of spots to be scheduled, or whether they have any definite point of view as to the nature of the places where advertisements are permissible or not. The first place we should be inclined to schedule is the River Thames, and we hope the Council is alive to the desirability of preserving its mystery and romantic beauty from the electric light monstrosities which now disfigure it. The trouble is that from the point of view of civic design any advertisement is in its nature a monstrosity. Any feature which jumps out of the picture and does not sink into the general composition tends to destroy the unity of the whole effect, and is to be deprecated, but unless it does so it is no use as an advertisement. The very idea of an advertisement is to force itself upon our attention by striking a discordant note in the general harmony. Although efforts have lately been made to raise the standard of pictorial advertisements and to invest them with certain artistic qualities, yet we think it cannot be disputed that their general underlying idea is inartistic and subversive of all the principles which are essential to the creation of the perfect city. It may be that at the present moment they are an unavoidable evil, but, if our towns are ever to be as beautiful as they are large, we must look forward to the day

when public advertisements will be forbidden by law or taxed out of existence. We trust this action by the County Council will prove to be the beginning of the end.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS: THE EXAMINATIONS.

IN reference to the Royal Institute of British Architects' Final Examination we have received the following announcement with regard to the alternative scheme of testimonies of study.—The alternative scheme of testimonies of study for the Final Examination will come into operation at the option of the candidates in November next, and after the end of the year 1913 the existing testimonies of study for this examination will be abolished. Six alternative problems in design will be set by the Board of Architectural Education each year, and candidates for the Final Examination must submit designs in answer to at least four of these problems. These alternative problems will be published twice a year, three sets in January and three in July. This is done for the convenience of candidates, but it must be distinctly understood that the time for sending in the designs in answer to these problems is strictly limited. Thus the designs for Subject IV. must be sent in to the Secretary, R.I.B.A., by August 31, 1912; those for Subject V. by October 31; and those for Subject VI. by December 31. (This time will be extended for students in the Colonies; see dates following list of subjects below.)

The drawings must be on imperial sheets, and candidates must affix their full name and address to each drawing submitted.

The subjects for the second half of the year 1912 are as follows:—

Subject IV.

(a) A Senate House, on an isolated site, for a modern University, to consist of a council chamber to seat sixty persons, with anteroom, waiting-room, and cloakroom, and two committee-rooms, each to seat twenty persons round a table. Plans, sections, and elevations to be to $\frac{1}{2}$ scale. Details, both external and internal, to $\frac{1}{4}$ -in. scale and shaded.

(b) A Bridge carrying a road 25 ft. wide between parapets over a canal 40 ft. wide. The bridge may be built of brick, stone, or ferro-concrete. Drawings to be to $\frac{1}{4}$ -in. scale and to show complete construction. Important details to 1-in. scale. Calculations to be given.

Subject V.

(a) A Picture Gallery in a public park, consisting of six galleries of varying size, but of not more than 8,000 super. ft. in all. The galleries are to be arranged with cloakrooms etc., so that they can be used for receptions. A room for a curator and a packing-room are to be included. Plans, sections, and elevations to be made to $\frac{1}{2}$ scale. Details, both external and internal, to $\frac{1}{4}$ -in. scale and shaded.

(b) A Village Church to seat 300. May be in any style, but with complete details of construction. Drawings required to $\frac{1}{4}$ -in. and $\frac{1}{2}$ -in. scale.

Subject VI.

(a) A Colonnaded Screen, 100 ft. long, joining two wings of a public building 60 ft. high. The screen to have two carriage entrances through it. Shaded drawings to $\frac{1}{4}$ -in. scale with 1-in. scale details.

(b) A Fire-Resisting Lock-Up Warehouse on a site 40 ft. by 80 ft., with two frontages 40 ft. wide to two parallel streets. The site is between buildings, so that no light can be obtained on the 80 ft. sides.

The building is to have six stories, and each floor is to be capable of sustaining a load of 4 cwt. per super. foot. Drawings required, $\frac{1}{4}$ -in. and $\frac{1}{2}$ -in. with $\frac{1}{2}$ -in. full-size details of important parts of any steel construction.

N.B.—A sketch perspective may be included in any of the foregoing, but is not compulsory.

BRITISH ARCHAEOLOGICAL ASSOCIATION:

CONGRESS AT GLOUCESTER.

AFTER an interval of sixty-six years the venerable British Archaeological Association migrated to the ancient city of the West, and there held its annual Congress, the proceedings commencing on Monday, June 24, and extending throughout the week. In 1843 the Association was then young, the Gloucester Congress being the third of the series, its previous assemblies having been held at Canterbury and Winchester. It could then boast of many great names in the archaeological firmament, such as those of John Britton, J. T. Pettigrew, Charles Roach Smith, Thomas Wright, Sir Samuel Rush Meyrick, whose memories are ever green amongst the students of antiquarian lore. Some years ago the venerable Association displayed some signs of age and a decrease of energy; but that period of decrepitude has passed. Thanks to the energy of its President, Mr. Charles E. Keyser, M.A., F.S.A., its Treasurer, Mr. R. Bagster, its Hon. Secretary, Mr. Allen Walker, and its active Council, the Association has taken a new lease of life, and may be trusted to carry on its useful mission for many years to come.

It was a happy thought to select Gloucester as the centre of the Congress for this year, and to revive the memories of the society's distinguished past history. Gloucestershire is a county rich in historical and archaeological associations. Its magnificent abbeys, its castles, its remains of prehistoric antiquities, its splendid relics of Roman rule, its grand churches, invite the members of such a society as the British, and repay the closest study. It is an ideal county for antiquaries and architects to roam, a land of bold natural contours of hill and dale, of rolling ridge and dipping combe, a land where timber and good building stone abound. The Cotswold region boasts of an architectural style of its own, where the masons of to-day carry on the traditional style of building handed down by their sires, and build naturally and unaffectedly. Wherever we roamed, driving in the Severn Vale or amongst the Cotswold Hills, we saw cottages, farmhouses, and manor-houses with many gables or projecting wings, ranging from the Tudor to the "Classic" of the Georgian period. We saw many splendid examples of domestic architecture, built of stone, with steep pitched gables, mullioned windows, with drip-stones over them, some with round-shaped mullions, others with hollow mouldings, high-pitched roofs covered with brown stone slabs. The chimney-stacks present interesting studies—the grand brick elaborate masterpieces of Thornbury Castle, or the simple farmhouse stacks composed of several chimneys, built of dressed stone, set together in diagonal clusters, massive and solid, and yet giving an impression of grace, variety and lightness. Here and there we saw those modern monstrosities of red-brick and blue slates, devised by jerry-builders, which when placed in juxtaposition to the creations of the old masons are a terrible eyesore.

Gloucestershire is a hospitable county, and the Association was welcomed with a heartiness which was gratifying in the highest degree. A strong local Reception Committee, composed of the Bishop and Dean of Gloucester, the Mayors of the chief towns and city, county gentlemen, and clergy, with an admirable local Congress Secretary, Mr. Roland Austin, made excellent arrangements for the comfort, convenience, and instruction of the visitors. Moreover, the county can boast of an active and vigorous archaeological society, which has for many years done good service in investigating the history and antiquities of the shire, and its Chairman, Canon Bazeley, placed at the

Dates for Submission of Designs.

	Subject IV.	Subject V.	Subject VI.
United Kingdom	31 August, 1912	31 October, 1912	31 December, 1912.
Johannesburg	31 October, 1912	31 December, 1912	28 February, 1913.
Melbourne	30 November, 1912	31 January, 1913	31 March, 1913.
Sydney	30 November, 1912	31 January, 1913	31 March, 1913.
Toronto	30 September, 1912	30 November, 1912	31 January, 1913.

disposal of the Congress his very complete knowledge of the story of abbeys and churches, castles and mansions, accompanied the party on all the excursions, and gave graphic descriptions of every object of interest which we met with during our travels.

The Congress opened on Monday, June 24, with a visit to the cathedral, formerly the Minster Church of St. Peter's Abbey, where the Very Reverend the Dean met the party, which numbered seventy persons, and told the story of that ancient fane—a story which it is almost unnecessary to repeat in the columns of the *Builder*, as it will be well known to most of our readers.

Cowkesbury Abbey, of course, is very similar, and was probably built by the same masons some ten years later than Gloucester. The Dean said that the first impression of the cathedral as they gazed on the exterior and saw the great Perpendicular tower, the story windows, and other features, that it was a Perpendicular church; but on entering the church they saw that it was really a Romanesque structure. The western arches of the nave were rebuilt in the Early English style with pointed arches when the west end had been ruined by a fire at the end of the XIIth century. The speaker described the church as it was when the whole of the nave was coloured and gilded, when a dozen altars stood with light gleaming, and there was a handsome wood-screen rich with golden colour, and the floor was paved with rich tiles. He disliked the present screen and the hideous flooring laid down 150 years ago. The Dean claims that Gloucester Cathedral was the birthplace of the Perpendicular style, and when we visited the south transept he maintained that theory. The Dean conducted the visitors to the choir, ambulatories, and Lady Chapel, and at each spot explained in his own graphic and interesting style the wealth of interest which each step in the pilgrimage revealed. Canon Bazeley and Mr. Waller, the Architect for the Dean and Chapter, also took charge of parties and explained many architectural details. Subsequently the Dean received the Association in the Cloister Garth and conducted them over the Deanery.

Reception at the Guildhall.

In the evening of Monday the Mayor of Gloucester, Councillor and Mrs. W. J. Johnston-Taughan held a reception in the Guildhall, when there was a large gathering of the principal people of the city and neighbourhood, and an exhibition of the Corporation insignia, charters, and records in which the city is specially rich. The earliest Council book bears the date 1486; the earliest Charter was granted to Gloucester by King Henry II. in 1155. These civic records are described in a volume of the "Reports of the Historical Manuscripts Commission," and reveal many matters of unique interest.

The Corporation insignia include two swords of State, one of which was provided under the Charter of Richard III., and the other under that of Charles I. in 1627; the Cap of Maintenance, worn by the Sword Bearer on State occasions; two handsome Maces; the Mayor's and Sheriff's chain and badge; the silver ear, an emblem of maritime jurisdiction vested in the Corporation, and several seals. The most interesting pieces of plate possessed by the civic authorities are the great Somers Salver, constructed in 1659 and weighing 203 oz., a large silver punch-bowl, given by George Augustus Selwyn in 1768, and a loving-cup presented in 1767.

The Mayor gave a hearty welcome to the Association, and said that he was glad that it had fallen to his lot to extend the city's greetings to its members for the second time in its history. He alluded to the richness of the shire in the remains of the British, Roman, Saxon, and mediæval periods, its ecclesiastical and other buildings of every style of architecture, and the city's share in the national annals, including the famous siege of Gloucester in the Civil War. Canon Bazeley, Chairman of the County Society, also welcomed the visitors, and Mr. Turry, its Secretary, read an address of welcome, in which he pointed out the benefits conferred upon a city by a visit of an Association in stimulating local effort and evoking attention to the antiquities of the neighbourhood. Many of the suggestions made at the Congress of 1846 had been carried into effect, including the foundation of a museum of antiquities in Gloucester, and the Bristol and Gloucester-

shire Archaeological Society, which was in a flourishing condition and had 600 members, would cordially welcome any pronouncement by the older Association which would tend to a better understanding of the antiquarian treasures left as a heritage of past ages and to a more reverent treatment of those which can be preserved from further damage or decay.

Presidential Address.

Then followed the Presidential address by Mr. Keyser, who referred to the early history of the Association, and remarked that, considering the wealth of material within easy reach of that most interesting city, it was surprising that no Congress had been held in Gloucester since 1846. The county, however, had not been entirely neglected, as Congresses had been held at Bristol and Cirencester, and just over the border at Bath, Evesham, and Great Malvern. Allusion was made to the grand scenery of the Cotswolds and the Forest of Dean and to the abundance of prehistoric and Roman remains and the admirable specimens of mediæval architecture. Unfortunately it had not been possible to include in their programme a visit to any of the earthworks, camps, and other early antiquities, and only a small portion of the remains of the Roman period would be inspected. An attempt had been made to see the splendid pavements at Woodchester, but it had proved entirely unsuccessful. The vicar of the parish had wisely protected them from the damaging effects of the English climate, but it was unfortunate that they should be hermetically sealed at a time when a society like the British Archaeological Association was anxious to view them and was willing to contribute materially to the cost of their exposure. The President then referred to the programme which had been arranged and to the important places to be visited, and proceeded to bring under the notice of Gloucestershire antiquaries three cases where he thought they might intervene in the interest of science in the one instance, and of religious sentiment in the other two. With regard to the Roman villa at Woodchester, which possessed the finest tessellated pavements discovered in this country, it did seem a pity that it should be sealed up, and that it should rest entirely on the caprice of one gentleman as to whether or not they should again become accessible to the outside world. He suggested that the pavements should be again uncovered, and the necessary protection provided, the cost of which would be defrayed by the contributions of visitors and by the financial assistance of the Association and other kindred bodies.

Mr. Keyser then called attention to the Priory Church of Stanley St. Leonards, containing some of the richest Norman work in the country. The west and south doorways had been unfortunately blocked up and the site of the Priory buildings was occupied by a farmhouse with very menial sheds and various farming requisites stored under the shelter of the walls of the church on the south and west sides. Could not some efforts be made to improve the surroundings of that beautiful church? At Deerhurst also there was room for improvement. The fine Saxon arch forming opening to the eastern apse had been blocked up, and a refuse heap filled up the apse, and it had been stated that the stones of that most ancient portion of the building had been removed to repair the neighbouring roads.* It was sad to see the site of the high altar where the most sacred rites of the Church were celebrated more than a thousand years ago desecrated and degraded in the manner described. The county was to be congratulated on the survival of two out of the four great abbey churches, St. Peter's, Gloucester, and Tewkesbury, which had been preserved through the public spirit of the citizens of that ancient borough. One could not but lament that the same sentiment was not exhibited at Cirencester and Winchcombe, and at Evesham, Abingdon, and Reading in the counties adjoining.

P. H. D.

(To be concluded next week.)

* Two days later, when the Association visited Deerhurst, the vicar strenuously denied that any stones had been removed and broken up, and that the site which had been lost to the church at the time of the Dissolution of the Monastery was only used for ordinary agricultural purposes. An inspection, however, showed how desirable it was that Mr. Keyser's suggestion should be carried into effect.

THE LONDON SOCIETY.

A MEETING of the London Society was held on June 27 at the Royal Society of Arts, Adelphi, when the debate was resumed on Mr. Rafles Davison's paper on "London as It Is and as It Might Be." A full report of the paper appeared in the *Builder* of May 31. Professor Beresford Pile presided.

Colonel R. C. Hellard,

of the Traffic Department of the Board of Trade, opened the discussion by explaining the principles on which the recommendations as to the proposed new roads of the Traffic Commission have been made. The speaker exhibited a number of diagrams and maps showing the distribution of population, the density in the various districts in Central and Outer London, the averages of commercial and passenger vehicles, etc. One map showed the new roads, bypasses, and road widenings suggested by the Traffic Department of the Board of Trade. He pointed out that the question had been considered by his department from the point of view of the effect on the convenience of the inhabitants in their daily life, but in dealing with the matter from the utilitarian point of view he did not undervalue the artistic conception which might be forthcoming. There were many cases where a pleasing effect could be produced at the same cost as a discordant effect, and even where the cost of obtaining a pleasant effect was more costly it might be that the money would be well laid out. He felt, however, that all such expenditure should be based on some utilitarian scheme, and two things were absolutely essential to a successful improvement. The first was the planning of a general scheme to which all new projects for improvement should conform; and the second was real co-operation amongst all the authorities and agencies concerned. As the result of the investigations of the department 125 miles of new roads were suggested and the improvement of 34 miles of old roads. In every case the proposed routes had been walked over, and he was satisfied there were at present no very serious engineering difficulties involved in the proposals, although obviously at any moment the matter might become complicated by the erection of new buildings. He deplored the production of paper schemes, which had not been worked out on the ground. He had examined a scheme for a circumferential road, which it would be absolutely impossible to construct. Such schemes confused local authorities. The matter was a pressing one because at the present moment many of the local authorities were considering town-planning schemes, and if something was not done these schemes would have matured independently, quite regardless of the general requirements of London, and the hope of getting arterial roads constructed at anything like a moderate cost would be banished. Of the 125 miles of suggested new roads, 40 miles would pass through areas where town-planning schemes were now under consideration, whilst at least another 20 miles lay across agricultural land. The road from Cromwell-road across Hammersmith to Hounslow, which would relieve the Brentford high-road which every one complained of, was now under consideration, as was also the Croydon bypass and the Surbiton bypass. The Cromwell-road to Hounslow-road would be 10 miles long, and was estimated to cost 1,750,000. It was a cost which alarmed people, but it must be remembered that this road would run through built-on land to a great extent. The first 2 miles would cost 1,000,000, and the second 2 miles about 500,000, and the remaining six only 250,000. He regarded it of great importance that building lines should be at once fixed in the areas so that when buildings came down the frontages should be set back, and this should be specially done in the case of villages like Elstree and Radlett, Enfield, and along the Cambridge-road. Garden frontages ought not to be allowed to be built upon. The London County Council had the Euston-road under consideration, and he thought that would be one of the first roads which would show them what a road should be, but there were other roads which should be looked to as likely to form parts of great north and south roads. By simply taking the gardens and forecourts, for instance, the Caledonian-road could be widened to 80 ft. or 90 ft. In conclusion, the speaker laid emphasis on the necessity for reserving sites for important public buildings, and for prohibiting the erection

of hideous buildings in important thoroughfares. He also thought that plans for business premises should not be passed unless provision was made for the necessary loading and unloading of carts on the premises instead of in the streets.

Mr. Paul Waterhouse

agreed that it was a perfectly sound doctrine that the improvement of London must be based on the utilitarian ground; and some people who had not been brought up in the profession of architecture might take the view that art had nothing to do with the question. But in architecture, which he took to be the greatest of arts, they had an extraordinary illustration of the truth that beauty and utility could go hand-and-hand together. He took it that the problem before them was simply like the problem of architecture, but on a large scale, and it was their duty to see that it was treated architecturally and not merely from the workman's point of view. The bypass had been mentioned, and he would plead very urgently for the use of bypasses in the villages. Anyone who had travelled through Edgware and noticed how the street had been widened by removing the faces of the houses would realise what a deplorable thing it was to mutilate a village in that way. Use and beauty might both be served by employing the bypass system in nearly every case where an important village had to be dealt with in the making of a road. The Fuston-road had been mentioned, but in that case an Act of Parliament had proved absolutely useless in the face of certain authorities who gave way. Last year he was invited to read a paper on this subject before the Royal Institute of British Architects, and his main point was that this being really an artistic problem in the large and wide sense of the word "art," it was one which ought to be carried out by artists. He did not think any sense of decency should prevent an architect saying that it was obvious artists of some sort must be engaged before this thing could be carried through, and he suggested that the Borough Councils should engage artistic advisers to see that the plans they passed were at least up to a certain minimum standard of architectural decency. If this supreme work of art, the regeneration of London, was to be helped forward by the Society there must be a point somewhere where artists must be employed.

Mr. Arthur Crow

considered the roads shown them by Colonel Hellard were admirable in their way in taking people out from the centre of London, but nothing had been done with regard to the through traffic in the centre of the City. The speaker exhibited a series of photographs to illustrate his suggestion for a new street which would run from Newgate-street, through the unloading yard of the old General Post Office, thence curving slightly to the north (and incidentally opening up Wren's beautiful church of St. Vedast in Foster-lane), and going by the back of the Guildhall to Moorgate-street by London-wall. Such a new street would lessen the journey to Liverpool-street by a quarter of a mile. If such a street was to be made it was essential that the Government should be at once approached, as the old General Post Office was to be demolished, and a building for the telephone department erected, which would extend over the loading yard facing Newgate-street. Mr. Crow also urged that it was true proper building lines for London were fixed and all the trouble of going to a Tribunal of Appeal regarding certificates of the Superintending Architect done away with.

Newgate-street and St. Vedast.

Mr. Gordon, L.C.C.,

also considered that the centre of London had been neglected by the Board of Trade, and he pointed out the difficulty of dealing with the various local authorities in regard to the allocation of the Road Board's grant for the construction of the new Western-road. It seemed to him that the improvements now needed in Central London were far more important than the Board of Trade now suggested. He knew there were gentlemen who would design beautiful schemes, but those who had to administer affairs had to be utilitarian. The party in power at Spring-gardens said that the amount which should be spent in London should be fixed by a 5d. rate, but to him that appeared to be an altogether fallacious criterion by which they should judge the improvements of London. Personally he did not think they would get an improved London till they had a unified London. They must have a scientific plan which must be centrally administered.

Mr. Raymond Unwin

said it might be worth while to remember the experience of another great capital of Europe which had had the same difficulty. Berlin found itself congested in the centre with a large number of outside authorities carrying out town-planning schemes made entirely from their own point of view rather than from the point of view of the centre. They would get differences of opinion between the inside and outside authorities of London if town-planning schemes were formed without the whole thing being co-ordinated. After a great deal of agitation they got the different bodies around Berlin together and instituted a competition for the laying-out of Outer Berlin. As a result it became evident to the inhabitants that a central authority was wanted to control the whole thing, and now they had got such an authority consisting of representatives from all the districts. They had laid down a plan, and when any district formed a town-planning scheme it must embody the main lines determined upon by the central authority. If they were going to do anything for London that was the thing they must concentrate upon. The present Government had said they would not create a Traffic Board, and now they must ask them what form of central control they would adopt. One important point for consideration was the question of uniting the railways and so avoiding the road traffic from station to station. In Berlin the conclusion seemed to be fairly unanimous as to the evil of the cross traffic from station to station. The point was of great importance when they considered such a scheme as the removal of Charing Cross Station to the south of the river. They would have to consider whether it would not be the right thing to link up Charing Cross, Paddington, and King's Cross, so as to eliminate the cross traffic from the streets. If they did not have a central authority they would get into a muddle.

The Chairman

said he would like to give what weight he could to the important remarks of Mr. Unwin. They realised that night what the Government had done in establishing a Traffic Department of the Board of Trade. If they cast their minds back they could scarcely have believed it possible for a Government Department to have initiated such a magnificently-worked-out scheme as Colonel Hellard had put before them. It was something for which they as Londoners must be profoundly thankful for. But the point of Mr. Unwin's was that no authority existed for putting these schemes into operation. They were face to face with numerous town-planning schemes which only applied to limited areas; whilst the Local Government Board administered the Town Planning Acts and the Board of Trade made these proposals for roads. The London County Council as at present constituted was not a body capable of dealing with the matter, for their area was comparatively small in relation to the area affected. There was urgent and serious need of legislation for London at the present moment, not only for the creation of roads, but for the harmony of a multitude of interests which circled round this great metropolis. They were gathered together in that Society with a new and larger enthusiasm for London of the future—not merely a more social London, but a more orderly and more beautiful London; and let them strive with the strong impetus they had had that night on the utilitarian side of the subject to cultivate the hope that with new roads they would find new

beauties, and seek for new hopes for London which must come.

Colonel Hellard

briefly replied on the discussion, and said it was true he had not largely gone into the matter of new roads for Central London that night. The cost of dealing with such proposals was rather prohibitive. At present he thought it better to turn one's attention to the prevention of further obstacles on the outskirts, because after all, the expense of dealing with roads in the centre would be no more expensive five or ten years hence. They had to remember that if they paid attention to the outskirts now they would get twenty times the result for the money spent; and if town-planning schemes were adopted without some relation to main roads they would never get such an opportunity again. He might add that the Traffic Department of the Board of Trade was in the closest touch with the Local Government Board.

THE GAS LIGHT AND COKE COMPANY.

On the 26th ult., the centenary of the Gas Light and Coke Company was celebrated at a dinner at the White City, when Mr. Corb Woodall (Governor of the company) presided over a company of visitors and the staff of the company numbering about a thousand. The Chairman was supported by the Lord Mayors of London and Manchester, Lord Shaw of Dunfermline, Lord Joicy, Sir William Richmond, Sir William Lucy, many of the mayors of the Metropolitan Borough Councils, Mr. D. Milb Watson (General Manager), and others.

The usual loyal toasts were enthusiastically received, as was also the toast of "The Imperial Forces," proposed by Sir E. A. Cornwall, M.P., and acknowledged by Major-General W. Fry. The Lord Mayor submitted the toast "The Gas Light and Coke Company" in brief speech, in which he recalled the day of his youth before lucifer matches were invented, and when he illustrated the principle of the gasometer to his people in the Lincolnshire Fens by the aid of a churchwarden pipe, the end of which was sealed with clay. He thought that every person who had had the opportunity of using gas must be grateful to the pioneers of the company.

The Chairman, in reply, said that was a great day for the company, for they met under circumstances which would excite feelings of pride and thankfulness. Although they had reached a hundred years, their sight was not dimmed, but it was rather increasing in brightness each year. When the Gas Light and Coke Company was launched it was a day of simple things. The company's capital was limited to 200,000*l.*, but now it was nearly 20,000,000*l.* It then occupied no more than 10 acres of land, and now it occupied more than 1,000. The coal carbonised in 1812 was less than 4.0 tons, and in the current year the consumption would not be less than 2,250,000 tons. Although the quantity used in 1812 was small, there would appear to have been some difficulty in getting it, because he read in a minute-book that on Christmas Eve one of the directors found there was not enough coal left the night, and he had to go out and buy some more on his own responsibility. In 18 the rates paid by the company were only 150*l.* 10*s.* 4*d.*, whilst during the present year the amount would exceed 300,000*l.* During the past five years there had been a steady reduction in the price of gas by a penny 1,000 ft. per year, which might seem a small reduction, but it amounted to 100,000*l.* per year. As to labour co-partnership, they had interested their employees in the pecuniary gains of the company, because they believed it was the best way known of meeting their interests. The late Sir George Livesey, who first introduced the system, recognised that it would be comparatively easy to join works shareholders, and consumers, and give each a share in the advantages accruing from economy and improvement in the methods of manufacture. The system had worked admirably. He recognised that it might be difficult to apply it to all industries, but believed it could certainly be adopted by public companies, including the railways.

Lord Shaw proposed "The Lord Mayor of London, the London County Council, and the London Borough Councils," and the toast was responded to by the Lord Mayor and J. Whittaker Thompson (the Mayor of Kingston).

Mr. N. V. J. Burke submitted the toast of "The Visitors."

Sir William Richmond, in reply, said he was not there as an artist, but as the President of the Coal Smoke Abatement Society. For twenty years it had been his ambition to attempt to diminish the smoke evil. How the enormous improvement that was really necessary was to be brought about he did not know, but he was perfectly convinced that the scientific energy of the country was absolutely incapable of dealing with even such a monstrous and entirely undesirable nuisance. If future generations would be able to say that London again becomes a place where flowers could grow and where all that was undesirable in its atmosphere had been eliminated, then science would have made an enormous stride for the benefit of the human race, second to none which it had yet achieved.

The Chairman submitted the toast of "The Staff," and remarked that there were about 900 officers of the company present. He believed they had a good staff, who did their best to increase the prosperity of the company.

Mr. D. Milne Watson (General Manager) said that such an occasion brought a lump into his throat. The staff of the company had a splendid centenary. In 1835 the staff was only thirty-five in number, and now they were upwards of 900. It was only by each one of them doing their duty that they could relieve the anxieties of the directors. Everyone of them felt grateful to the directors for the co-operation they gave them a short time ago. They would hope to still carry the torch of the company on as it had been so well carried in the past. He might add that the staff proposed to present the Governor with his portrait as a souvenir of the centenary of the company.

The proceedings concluded with loud cheers for the Chairman.

STOCKPORT UNION: MENTAL WARDS COMPETITION.

As we announced last week, the following is the result of the recent competition for the new Mental Wards adjacent to the Stockport Workhouse Infirmary:—

First premium, 100*l.*, Messrs. E. T. Hall & Stanley Hall, of London; second premium, 50*l.*, Mr. Arthur Marshall, A.R.I.B.A., of Nottingham; third premium, 25*l.*, Messrs.

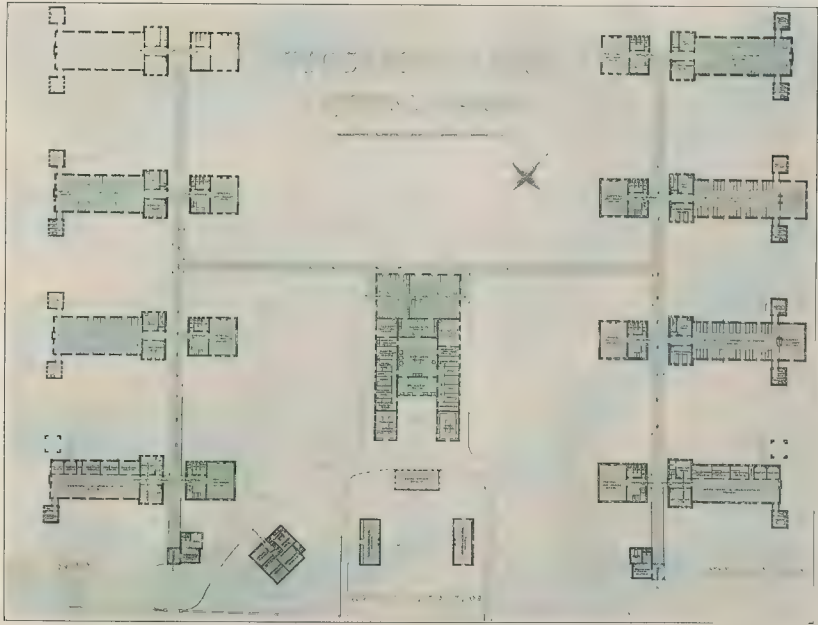

Spalding & Theakston, of London. The competition was limited to thirty invited architects, among whom were firms well-known for their hospital and asylum work. Mr. H. W. Wills, A.R.I.B.A., of London, was the assessor.

The conditions required that the new buildings should provide accommodation for sixty-six males and eighteen females in the mental wards; eighteen males and twenty-four females in the sick wards; eighteen males and forty-four female epileptics; and for three male and three female short-period cases, the latter being severe cases which will be temporarily accommodated pending their removal to other institutions. All epileptic, sick, and short-period cases, and all day-room accommodation for mental cases were to be on the ground floor; dormitories for mental cases were to be provided on the first floor. Adequate administration buildings were required, including quarters for steward, resident and non-resident staff, and a common dining hall, with kitchen, scullery, and stores, and the usual complement of workshops and laundry. The requirements were set forth on very broad lines, considerable latitude being allowed to competitors as to the planning and provision of the details of the accommodation. The cost was limited to 100*l.* per bed, so that the expenditure will be upwards of 26,000*l.*

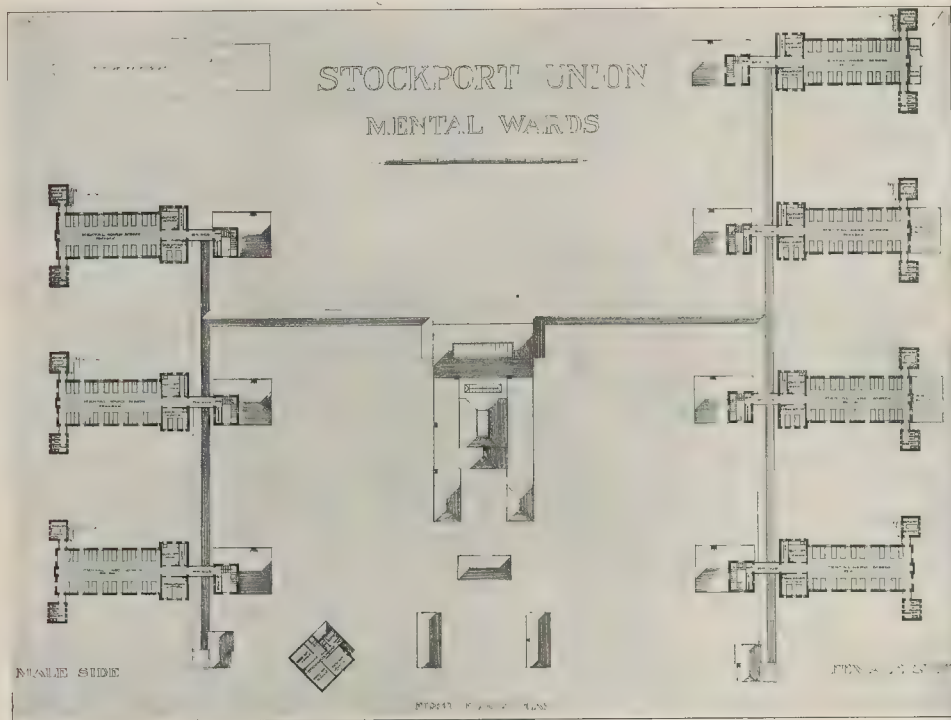

The new buildings will be erected on a site of 10½ acres immediately behind the present Workhouse Infirmary, a group of buildings of an interesting type of architecture, adding no more interest than is usually the case with poor-law buildings to a rather fine stretch of country, which enhances the value of the site immensely as a position for a hospital or an asylum, and which will in all probability continue to do so for some time in spite of neighbouring encroachments of the jerry-builder, as it is dedicated to the pastime of golf. The north point lies diagonally across the plan of the site, so that as regards aspect the axes of the wards might be equally well parallel to the side or the front boundaries. Two definite alternative methods are therefore presented. Most competitors took their cue from the present buildings and placed their wards parallel to the sides on a cross corridor reaching out on either side of a central administration block; whereas the first and second designs are the only schemes in which the other alternative was adopted, and evidently by reason of this found favour in the eyes of the

assessor. This arrangement is not necessarily the better, but by following it boldly to its logical conclusion in the placing of their patients' entrances Messrs. Hall have achieved a masterly plan, and have avoided the initial blunder of almost all the other competitors. There is no separate approach to the new buildings. They are reached from the present main entrance round the flanks of the existing hospital, and most schemes show a central entrance block to the new buildings axial with the present entrance, and, as most of the patients are housed in wards reaching out far on each side of the centre, they will have to travel a prodigious distance after entering the institution at the lodge before reaching their ultimate destination. The winners place their patients' entrances at the ends of their outer corridors, thus giving as direct means of approach as was possible. They also avoid another mistake of which the exhibition furnishes numerous examples. The favoured—in fact, inevitable—position for the dining-room is in the central block; the favoured arrangement of its approach means collision between patients on their way to the hall and the traffic from the main entrance, or at any rate unwelcome observation of one by the other. The winning plan by providing a separate cross corridor from the ward blocks on either side to the dining hall avoids both.

It is, of course, the design of the block plan that matters above all else in the case of an institution like this; the rest is not much more than a filling in of details. Fine strokes of broad planning tell in the former; care and ingenuity in the latter. The winners have undoubtedly scored in respect of the block plan—it is unquestionably the best, and the assessor could not do otherwise than place it first. We could wish, however, that it had been accompanied by more studied planning of detail. It is good hospital planning, but hardly appropriate to an asylum. It would almost seem as though the authors had first planned an infirmary and had then wrenched their plan into asylum shape—the bends and joins are so evident. Little regard has been paid to the fact that the mental patients do not live in their wards. The male patients' day-rooms have a north-east aspect, whereas the wards have been carefully studied in this respect. The administration arrangements, however, suggest an experienced hand. The kitchen block is admirable, and the new

First Premiated Design: By Messrs. E. T. Hall, F.R.I.B.A., & E. Stanley Hall, A.R.I.B.A.

First Premiated Design: By Messrs. E. T. Hall, F.R.I.B.A., & E. Stanley Hall, A.R.I.P.A.

workshops are well placed in a group with the present ones, this being due to the fact that the authors have resisted the temptation to give their buildings a façade behind the present hospital.

The second premiated design appears on paper to be more congested than the first, and, although it lacks extreme simplicity in its block plan, this is due to the more careful elaboration of details. Special care is evident in the planning of the rooms used by mental patients during the day, the airing courts, and the attendant conveniences being well thought out—and this is surely an important consideration. The scheme is a really fine piece of asylum planning. Great care has been taken to give the best aspect to the day-rooms; unfortunately this does not always ensure a good outlook as well, for, while the rooms will be sunny, they often command a dreary expanse

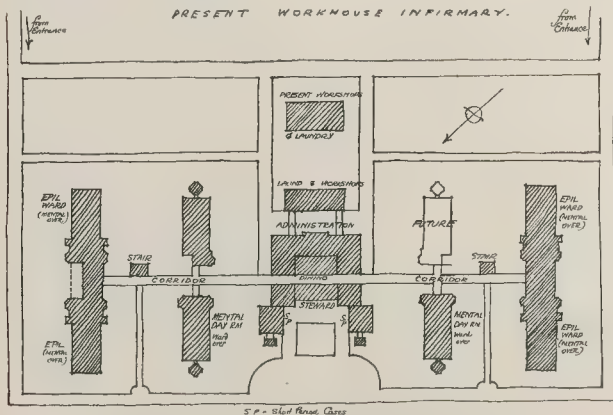

of corridor or wards. One of the difficulties of this competition has been to provide sufficiently direct communication between the day-rooms for mental patients on the ground floor and the dormitories on the first floor, as the latter have to be planned over epileptic departments, which are distinct from the mental day-rooms. In this scheme, as in many others, this communication is not well devised. In almost all other details the scheme is the most efficient in the exhibition.

The third design is entirely different in principle from the first and second, and follows in its block plan the alternative adopted by the majority of the competitors, of wards parallel to those of the present hospital linked together by a main cross corridor. The idea of an entrance façade has appealed to the authors no less than to most of the competitors,

but instead of allowing it to face the existing buildings they treat the other side of the whole group as a façade, at the same time providing entrances on the nearer side. This has led to a sound block plan, one of the advantages being the grouping of the new and the present workshops together. The epileptic patients' day-rooms have good aspect, but the staircase to the first-floor dormitories from the mental patients' day-room might with advantage be nearer to the latter. We do not think that a vast common day-room for all the inmates of each sex for this class of patient is ideal. The elevations are not the negligible quantity the most of the others are.

Messrs. Briggs & Wolstenholme submit a block plan most interesting because it shows an attempt to group the various departments more clearly than any of the others. This brings the mental patients' day-rooms into better relation to their dormitories, but it has involved some congestion at the entrances and staircases and a sacrifice of simplicity. The scheme is carefully thought out and contains many instances of good planning, but we must except the arrangement whereby patients *en route* for the dining-room are brought so near to the receiving entrance. The elevations in this case are entirely successful and appropriate.

We welcome one or two good schemes from Manchester architects. Messrs. Sykes & Eyal submit a clear and well-thought-out block plan which might with advantage be spread out a little more. They have evidently given much study to the aspect of the various rooms; the working arrangements are admirable, but the accommodation for short-period cases is not so well devised. Mr. J. D. Holt's plan sounds in all but the way in which he cuts up the spaces between his buildings by sanitary towers and other projections. Mr. J. Lodge submits a careful scheme upon ingenious lines distinguished mainly by the diagonal axis which have figured largely in some of his plans of late. It is a plucky attempt to obtain the best possible aspect—an alliance with a refractory north point whereby a handicap of fort five degrees of sunny aspect results, but at the cost of coherence in the block plan.

Third Premiated Design: By Messrs. Spalding & Theakston.

all thoroughly worked out and excellent in details, and we remarked that Mr. Lodge, in company with the winners, have not brought their patients' entrance to the middle of the stup.

GENERAL NEWS.

University Awards in Architecture.

University of London, King's College.
The First-Class Certificate in Architecture, exempting from the Intermediate Examination the Royal Institute of British Architects, has been awarded to A. M. Aly, M. A. Atalla, F. E. Hudson, and H. Izzy. The external examiner is Mr. H. D. Seares-Wood, F.R.I.B.A. The winning special prizes have also been awarded the day classes:—Studio, M. A. Atalla, Bronze Medal; H. Izzy, prize in books. Architectural story: (a) Classic, prize in books, W. Holden; European, Bronze Medal, L. W. Walker; Building Construction: (e) Preliminary and Crease Work, prize in books, F. E. Hudson; Work of the Finishing Trades, Bronze Medal; Holden; (g) Sanitation and Advanced Construction, Bronze Medal, H. Izzy.

University of Sheffield.

The Diploma in Architecture has been awarded as follows:—First-class, John C. P. Othill; second-class, Harry B. S. Gibbs. Certificate in Architecture—First-class, John H. Othill; second-class, Henry B. Leighton, George A. Booker (on completion of design), the course for the diploma is a five years' the Diploma in Architecture is now awarded the first time. The external examiner is Professor F. M. Simpson, F.R.I.B.A.

Sir F. W. Willis, Knt., F.R.I.B.A.

Sir Frank W. Willis, Lord Mayor of Bristol, on whom the King conferred the honour of knighthood on Friday last, is a Past-President of the Bristol Society of Architects. He was elected a Fellow of the Royal Institute of British Architects in 1900, and served as a member of Council. He was the architect of the Red Maids' School, St. George's Public Library, Taunton School Chapel, the Municipal Art Gallery, the Bristol Museum extension scheme, and many other public and private buildings in Bristol and around.

Cathedrals of England and Wales.

Mr. B. T. Batsford will publish in a few days new and re-illustrated edition of Mr. Francis and "Cathedrals of England and Wales."

Appointment: British Museum, Prints and Drawings Department.

The vacancy caused by the retirement of Sir Henry Colvin, Keeper of the Prints and Drawings, has been filled by the appointment of Mr. Campbell Dodgson, M.A. Oxon., who has been assistant in the department during twenty years past. Mr. Dodgson was a scholar of Manchester and New College, and graduated in 1910; he has compiled a catalogue of early English and German woodcuts.

Telegraph-hill, Hampstead.

The Hampstead Heath Protection Society writes co-operation in their efforts to preserve the public the 5 acres of Telegraph-hill which lies on the western side of the Heath, between West Heath-road and Platt's-lane, and on the property of Sir Spencer Mayon-Hill, lord of the manor. Telegraph-hill, to an altitude of some 300 ft. above sea level, commands a beautiful prospect of the northern and western environs of London, which extends as far as Windsor Castle.

Richmond Bridge.

The Richmond and Twickenham Councils have revived the project to widen Richmond Bridge and to improve the approaches by lowering their gradient-rates, and have jointly petitioned the county authorities in the matter, a alternative scheme is suggested—the construction of a new bridge lower down the river in alignment with the main road from Kew. Richmond Bridge, one of the most beautiful of the Thames (old) bridges, was built in 1774-77, under the designs of James Paine, or Payne

(who subsequently built the old bridge at Kew), assisted by Kenton Couse, of the then Board of Works, at a total expense of 26,000. The Act 13 Geo. III., c. 83, enabled the Commissioners to purchase the lessee's interests in the ferry, which yielded some 1,300l. per annum. The bridge, as the Act provides, has a middle arch of 60 ft. span and 25 ft. high from low-water line, the side arches decreasing proportionately; there are also five brick arches on the Middlesex shore for the escape of flood waters. The width between the parapets is 24 ft. On January 3, 1903, we published a two-page view of the bridge, from a drawing by Mr. W. Monk.

Westmorland Ancient Monuments.

Mr. J. F. Curwen, F.S.A., Mr. W. G. Collingwood, F.S.A., and Professor Haverfield have prepared a lengthy report on the ancient buildings, earthworks, and other monuments of antiquity in the county of Westmorland. Referring to an accompanying schedule, they observe:—"We would ask you [the members of the County Council] not to deem any item as unworthy of protection because it is little known or scarcely visible to the eye. Forming as they do the landmarks of topography and history, each one contributes to our knowledge of Westmorland, and, however doubtful some may be until further explored, they are all the more worthy of care, because they have not yet told their story. We have desired to schedule medieval grave-slabs, and also sculptured fragments at present sheltered in the churches. At first sight this may appear unnecessary, but sculptured stones are protected in the Scottish churches, and without this there is nothing to prevent any incumbent from turning such relics out of doors." After urging the importance of putting the Ancient Monuments Acts into operation, the report points out that, however careful the present owners may be, it does not follow that the monuments will not, at some time, pass into the hands of those who have no interest in them, and the fact is indisputable that each year numbers of earthworks are destroyed, and, by gradual splitting, masonry falls to the ground. For example, the keep of Brough Castle is bound to collapse before long unless attended to, and Arnside Tower is in considerable danger.

The schedule of "monuments" which it is suggested should be brought under the protection of the Acts includes Shap Abbey, founded in 1191; St. Mary's Chapel, Askham Hall, dating from the time of Henry IV., and now used as a dairy; Nether Bridge, Kendal, built before 1376; Devil's Bridge, Kirkby Lonsdale (prior to 1275); Appleby Castle (1174); Brough Castle (1170); Brougham Castle (1220); Kendal Castle (1184); Pendragon Castle (1180); some twenty pre-Norman (VIIIth to XIth century) crosses and carved stone monuments; post-Norman market crosses at Ambleside, Appleby, Milnthorpe, and other places; about 100 earthworks, forty-eight medieval grave-slabs, nearly a score of megaliths, fifteen pele towers, several holy or historic wells, etc.

An Engineering Visit.

A party of engineers, members of the London and South-Western Railway staff at Reading, have recently visited Manchester, spending three days there. They visited the following works:—British Westinghouse Electric and Manufacturing Company, Ltd., Trafford Park; Great Central Railway Companies Works, Gorton; Crossley Brothers, Openshaw; Messrs. B. & S. Massey's Steam Hammer Works, Openshaw; Craven Brothers, Vauxhall Works, and Reddish. The arrangements were carried out by Messrs. Penningtons, Engineering Tutors, Oxford-road, Manchester. The visit was a success, and is likely to be the precursor of others.

BOOKS.

Housing and Town Planning. Edited by THOMAS COLE, Assoc.M.Inst.C.E. (London: E. & F. N. Spon, Ltd. 10s. 6d. net.)

This volume consists of seventeen papers presented for discussion at the Conference with delegates from local authorities on Housing and Town Planning held under the auspices of the Institution of Municipal and County Engineers at West Bromwich in July, 1911. A complete illustrated report of both papers and discussion at such an important Conference

as this forms a record of considerable value. The papers cover a wide field and deal with many aspects of the question, and acquire a special interest for the reason that, having been contributed by members of the Institution of Municipal and Borough Engineers and others holding similar official positions, they afford an insight into the point of view and give the experience of those directly connected with the administration of the Act. Of special value is the record of work done in such large towns as Leeds, Sheffield, and Liverpool. Apart from the diagrams in the text, a collection of thirty-nine illustrations bearing on the general question adds to the interest of the volume as a book of reference.

The Law of Town Planning for Scotland. By ALEXANDER WHITE, LL.B., W.S. (Edinburgh and London: William Green & Sons, Law Publishers. 1912. Price 5s. net.)

THIS excellent little handbook should be found very useful by county or borough officials and by all those in any way concerned with the administration of the Town Planning Act in Scotland. It discusses briefly and lucidly the different aspects of the Act under such headings as Beauty, Prevention of Overcrowding, Traffic Facilities, Open Spaces, etc., and deals also in like manner with the necessary procedure and such questions as compensation, finance, and the encouragement of building societies. A valuable feature of the book is an Appendix containing the statute with explanatory notes, schedules, procedure, regulations, and the forms of the various notices, resolutions, etc., which are applicable to the different stages of the proceedings. There is a useful index, and paper, printing, and binding are good. We welcome every attempt to bring home to local authorities the advantages and possibilities of this Act.

CORRESPONDENCE.

A Suggested Whitehall Improvement.

SIR,—In reference to the article appearing in the "Monthly Review of Civic Design" in your issue of the 7th ult., and the plan for a proposed new street which, as you point out, would provide for a fine architectural treatment of the east side of Whitehall.

The Public Offices (Sites) Bill, now before Parliament, deals with the matter of the acquisition of the site for a new block of Government offices between Horse Guards-avenue on the north and Montague House on the south, and the plans prepared show that it is intended to place the new building behind and parallel with the Banqueting Hall, while the Embankment frontage is to be on a line drawn from the angle of New Scotland-yard Buildings to Whitehall-court.

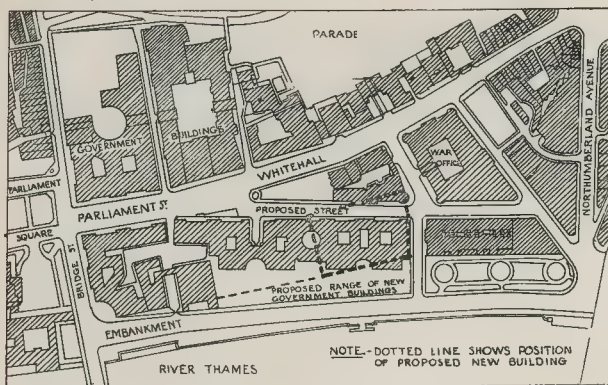

This arrangement, if proceeded with, would effectually and permanently prevent any such improvement as suggested in your plan, and would be, I venture to think, a most inadequate treatment for so important a thoroughfare.

As it is apparent that, with the steady increase in the number of Government offices, the whole of this area between Horse Guards-avenue and Bridge-street will eventually be required for public buildings, it is urgently necessary that the first step in laying-out this area should be to provide for future extension.

The triangular shape of this district makes this a matter for careful consideration, and the chief question appears to be as to whether it is better to keep the Embankment frontage to the line of Whitehall-court, etc., or to treat Whitehall as the important frontage and arrange the buildings to open this out and produce a fine architectural effect.

From an architectural, historical, and practical point of view it seems to be obvious that the latter solution is the correct one, and the provision of the suggested new street or some similar plan should be adopted.

The present proposal would leave the Banqueting Hall, United Service Institution, and Gwydir House standing as a detached island without any architectural coherence, it would not in any way improve the traffic route, and the opportunity would be lost of making both a fine monumental site at the junction of the proposed new street and also a magnificent vista looking down the new street with Westminster Abbey as the culminating-point.

A Suggested Whitehall Improvement.

This is a matter which might be seriously considered by the Institute and representations made to the authorities before the plans have progressed too far to allow of alteration; but as the Sites Bill is now being considered these measures should be taken at once.

E. HOWLEY SIM.

Timber Specifications.

SIR, The correspondence which has appeared recently on the above subject in your valuable paper has, I am sure, been followed with great interest by those who have from time to time come into contact with specifications which have certainly not been "up to date."

"A Reader" has set out his ideal specification, but upon analysis it proves to be unpracticable owing, apart from the question of cost, to the fact that the import of timber of the qualities he mentions for joinery, and also for yellow floorings, are not sufficiently large to do a twentieth part of the contract work of this country, and if such a specification was generally accepted by the architectural profession it would simply mean that the shippers would be compelled to meet the demand by reducing the standard of their shipments—i.e., that what are now known as firsts would have added to them the seconds and possibly some thirds, all to be called "firsts" to make sufficient to meet the demand of the architects' specification, so that the new position would be worse than the old.

Referring to his general clause at the end, I, together with many other readers, would be glad to know his definition of "thoroughly seasoned" timber as applied to (1) carcassing timber, (2) joinery timber, (3) flooring; the term is so generally used and so little understood that any assistance he can give in this direction would be much appreciated.

To specify particular brands and shipments must surely be quite out of the question, as pointed out by your correspondent last week, and for the further reason that should a contractor have a large stock of timber of equally good quality, which has been in stock several years, he is precluded from using it, and to comply with the specification to buy and use other timber which is no better, and not nearly so dry, thus giving no encouragement to the contractor to stock timber at all, but to purchase from hand to mouth as he requires it.

The question is one altogether too lengthy to discuss in detail by correspondence. What is wanted is a conference between the interested parties, which, I think, would lead to a much better understanding than now exists. Our thanks are due to "A Reader" for having initiated the discussion, and to you for the part you have taken in the furtherance of this much-needed reform.

ANOTHER READER.

SIR—I have read with much interest Mr. James Davies' letter in the current issue of the *Builder*, and, with your permission, wish to clear up some points he raises in connexion with my letter published on 21st ult.

Mr. Davies refers in his second paragraph to "new clauses based upon limited information, conveying an illusory suggestion of up-to-

date knowledge," and in the fourth paragraph he says that I have "been well advised."

Why does he assume that the clauses are new and based upon limited information? They are not new so far as I am concerned, for I can show my specifications quite similar extending back to 1895. I say similar, because I do not always specify the same; it depends on the quality and locality of the work, on the availability and condition of the stocks in the market, revisions of nomenclature due to alterations of quality, classification, and changes of ownership of forests and mills, etc. Then I object to "limited information" and "well advised." If he infers that my information is limited, because I confined myself in the letter to a few shippers of each kind of material, I would refer him to the letter, in which it is stated, "I could give others equally as good." As to well advised, it does not follow that when a professional man evinces a knowledge of trade technicalities he has taken advice from a member of a trade; and the suggestions of "well advised" and "limited information" both fall to the ground when I say that I have had no information or advice given me *en arrive*. As to "conveying an illusory suggestion of up-to-date knowledge," Mr. Davies knows perfectly well that all the shippers I quoted are large present-day exporters of high-class material, so where does the illusion come in?

In his fourth paragraph, also, Mr. Davies asks, "What is the builder to do when those shipments are not up to their usual standard, or when they are not available at all?" And he also states "there would not be anything like enough of their higher qualities to go round," etc. If he will refer to my letter he will see that I have provided for these contingencies, for I say (sixth paragraph), "I qualify the specifying for certain reasons," etc. In the next paragraph I say, "Chiefly for best-class work," and further on, "The stocks available and their immediate conditions would guide me personally as to whom I should include." Now, I ask, suppose he was having a building erected in a certain place, and at a certain time, would he not stipulate what shipments and market qualities of timber were to be used in his own building, gauging his requirements according to what he proposed to spend? That is exactly what I do, being guided entirely by what is available and suited as regards its immediate condition and value, and by the character, situation, and geographical locality of the work it is required for.

Fifth paragraph of Mr. Davies' letter. I may, perhaps, remind him that a building owner, through his specifier, or otherwise, has equally as much right to say exactly what shipments, qualities, etc., of wood goods he desires, as the timber merchant has to choose which shipments, etc., he will buy from the exporter, always, of course, providing he asks for something which is obtainable.

I quite agree with the sixth paragraph of Mr. Davies' letter, in which he re-echoes what I said in the early part of my seventh paragraph as to general perfection: also my specification makes due allowance for centres, knots, and sapwood in deal. I do not suppose any reasonable man would expect in deal the perfection yielded by more expensive woods; but if he is using an article with the avowed intention of saving money, it is only right such money should actually go to the client's credit. In contract work the price to be paid by the building owner is fixed before the goods are supplied, and if by latitude in specifying the contractor is able to supply an article

which costs less money than he anticipated in estimating, you cannot blame him; therefore the specification should define what this saving is to be by specifying definite goods which will really save the money to the building owner by their cheapness and suitability taken together.

I think it is undoubtedly due both to the building owner and the contractor that the former should get the best materials for the specific purpose at a fair price, and that the latter should have sufficiently definite information given him in the bills of quantities to enable him to base his price on practically the same net cost as his competitor, and these would not obtain by using the specification suggested in Mr. Davies' letter. For one building, seconds of certain shipments might be most suitable and economical in the long run, for another building perhaps fourths, and several different contractors, could start their prices at as many different rates per standard or load, according to their judgment of what the specifier would or would not pass. I mean that those acquainted with the specifier in previous works would know his peculiarities, and thus gain an advantage over those who did not, which, I submit, is not fair competition.

Apologising for trespassing on your valuable space,
B. E. LAINE-PEARSON,
Quality, Quantity, and Value Surveyor.

[* * The purpose of this correspondence having been fulfilled, we cannot continue it.—Ed.]

Machinery Used in Construction of Roads.

SIR,—At a meeting of the Committee appointed by the Local Organising Council of the International Road Congress (London, 1913) to report on machinery used in the construction and maintenance of roads it was resolved that information relating to improvements effected during the last two years in sweeping machines, water vans and carts, light and heavy rollers, tarmacadam and concrete mixers, stone driers, and heaters, transport engines and wagons, stone crushers, pulsmeter pumps, woodblock renovators, and any other machinery used for the above purpose, should be collected.

Manufacturers and others willing to supply particulars are invited to send catalogues to J. S. Killick, Engineering Inspector, the Road Board, Queen Anne's Chambers, Westminster, S.W. (Sgd.) W. REES JEFFREYS,

Hon. Secretary.

Permanent International Association of Road Congresses, Local Organising Committee, London Congress, 1913.

The Architect as Arbitrator.

SIR,—In the short article under the above heading in your issue of June 28 the writer suggests that, but for its inclusion in the new edition of a certain well-known work, the important case of C. R. Roberts & Co. v. Hickman & Co. would have passed unnoticed.

May I point out that a good report of it appeared in your own columns in the issue of May 12 last year, and also that the case has been much discussed during the last few months in connexion with certain papers read at the Royal Institute of British Architects?

E. GREENOP.

INTERCOMMUNICATION COLUMN.

Mural Painting.

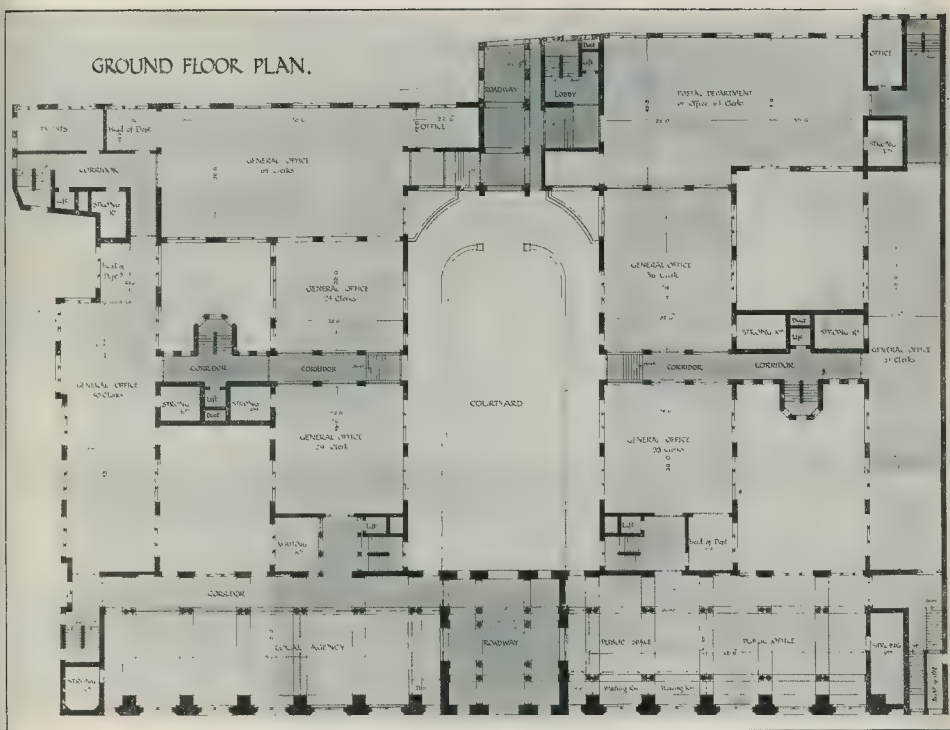

SIR,—I am about to execute a mural painting on the walls of a new church, and am anxious to avoid disaster from damp. I purpose to work on canvas in tempera. Can your readers advise me as to how the canvas should be treated and fixed to the wall, so as to avoid "sagging" and the ill-effects of damp?

MURAL PAINTER.

Foundation for Maple-Boarded Floor.

SIR,—I should be much obliged if you would be so kind as to let me know what is considered to be the best foundation for a maple boarded floor in a squash racket court. I am building one near York, in which it is decided to use maple boards, and I am told that a concrete breeze floor under it, and to which it would be nailed direct, is a good thing, but would be glad to know whether you confirm this. The court is 35 ft. by 20 ft. inside walls are brick.

ERNEST R. WALKER.

Design for the Pearl Assurance Offices.

By Professor Beresford Pite, F.R.I.B.A.

ILLUSTRATIONS.

Liverpool Garden Suburb.

THIS illustration is given in connexion with an article in our Monthly Review of Civic Design on page 13, where a description of the garden suburb will be found.

Design for the Pearl Assurance Offices.

PROFESSOR PRIME's design was submitted in the limited competition recently held for the offices of the Pearl Assurance Company, now of Adelaide-place, London Bridge, proposed to be erected upon a large site on the south side of Holborn, where the thoroughfare widens near Lincoln's-Inn-fields. The dignity of a great office and the entrance to a quadrangle and series of courts are the elements to be expressed, granite and Portland stone being the materials specified.

Mr. H. Percy Monckton, F.R.I.B.A., was successful in the competition. The building is now in progress, and it is hoped that it will be ready for occupation next year. The estimated cost is about 158,000*l*.

Church Hall, New Brighton, Cheshire.

This building, which is now in course of construction, is situated at New Brighton, immediately opposite St. James's Church, with which it is connected. It is being built out of funds left by the late Mr. Frederic North for this purpose. The walls are faced with 2-in. mixed red bricks from Basingstoke, and similar moulded brick dressings, relieved with stone gable copings, and the stonework around the west entrance and outer doorways. The roof is covered with grey slates from North Lancashire. The window jambs and mullions are of stone, with moulded brick jambs, heads, and sills around them on the outside, and are glazed with leaded lights and iron casements.

Internally the hall is arranged with three classrooms on the north side, which are divided from it and from each other with sliding glazed screens, so that the whole may be used as one hall when desired. Underneath the retiring-rooms behind the stage a gymnasium for boys is arranged. The builders are Messrs. Jones & Sons, of Liverpool, and the architect is Mr. E. Guy Dawber, F.R.I.B.A., of London. The drawing is exhibited at the Royal Academy.

House at Worplesdon.

THE drawing which is reproduced herewith is exhibited in the Royal Academy, and illustrates a house which has recently been completed at Worplesdon. The site selected is a most beautiful one of ten acres immediately adjoining Worplesdon Golf Links and within a mile of Brookwood Station. It is well wooded, and slopes gently to the south, giving plenty of

scope for the architect in his treatment of the gardens.

The house itself is built of Lawrence's 2-in. red bricks of varied hues of reds and of beautiful texture; the windows are of Monks Park stone, with steel casements. The roofs are covered with Ames & Hunter's red tiles, also of varied colours, the whole effect of colour being that of an old house harmonising well with the setting of trees.

The ceilings of several of the rooms are treated with modelled plasterwork by the Bromsgrove Guild, who also supplied the lead rainwater heads.

The electric lighting is by Messrs. Elliott & Co., of Oxford; and the heating by Messrs. Jeffries & Co., of Old Queen-street, S.W. The sanitary fittings have been supplied by Messrs. John Bolding & Sons; and the grates and chimneypieces by the Well Fire Company.

The sewage is treated by means of bacteria beds, supplied by Messrs. Tuke & Bell.

Church Hall, New Brighton.

Mr. E. Guy Dawber, F.R.I.B.A., Architect.

The whole scheme of building includes three lodges and a garage. The general contractors are Messrs. G. E. Wallis & Sons, of Maidstone; and the architect is Mr. Leonard Martin, F.R.I.B.A., of Seymour House, Waterloo-place, Pall Mall, S.W.

MEETINGS.

JULY 4, 5, AND 6.

Liverpool Architectural Society (Incorporated).—The Architectural Associations of London and Dublin will visit Liverpool on Thursday, Friday, and Saturday. It has been arranged by the Council to entertain the visitors to a supper, to be held at the University Club, on the evening of Saturday, July 6, at 8 p.m.

MONDAY, JULY 8.

The Incorporated Clerks of Works' Association (Carpenters' Hall, London-west).—Paper by Mr. W. E. Robson, M.Inst.E.E., on "Electric Railways." 8 p.m.

COMPETITION NEWS.

A list of current Competitions is printed on page 27.

Our Regent's Quadrant Competition.

We have received the Assessors' Report in this competition, which we print *verbatim* here-with:—

The award has been made as follows:—

First place, Design No. 129.

A prize of Ten Guineas each to designs Nos. 103 and 99.

The Assessors consider that the principles embodied in the design placed first, as illustrated in the alternative sketch, are effective as carrying on the main horizontal lines laid down by the Piccadilly Hotel frontage, while preserving a scale of architecture suitable for the width of this particular street. They regret that the shop fronts and frieze of the windows under the main cornice were not detailed on the eighth-scale drawing, as they are shown on the alternative sketch.

No. 103 shows the same regard for practical considerations and general proportions as the above, but the use of pediments on this curved frontage is questionable, and the depth of the recessing between the two end blocks is too great. The detail would require to be more scholarly in execution than suggested on the drawing.

No. 99. The great architectural ability and accomplishment of this design is evident, but the scale of portions of the building is dangerously large, and that part of it above the present hotel cornice line is quite out of keeping with the street, except at the end overlooking the Circus. The Assessors also desire to

mention Design No. 26 on account of the ingenious and effective treatment of the shop frontage and story over.

WILLIAM FLOCKHART, F.R.I.B.A.

E. A. RICKARDS, F.R.I.B.A.

ALAN E. MUNBY, M.A., A.R.I.B.A."

From a letter accompanying this Report we understand that the Assessors assume that the three designs specially mentioned, together with No. 26, will be considered by Messrs. Swan & Edgar, who have interested themselves in this matter, "and it is their hope" that the authors of all designs recommended may find themselves engaged in some way in the rebuilding of Regent-street.

We have pleasure in giving the names of the successful competitors as follows:—

No. 129.—Messrs. A. E. Richardson & C. L. Gill, A.R.I.B.A., London.

No. 103.—Mr. Albert W. Moore, F.R.I.B.A., London.

No. 99.—Messrs. Tait & Whitelaw, London.

No. 26.—Mr. George Drysdale, A.R.I.B.A., London.

Cheques for the following amounts are being forwarded to the successful competitors. First premium, twenty-five guineas; to the authors of designs placed second and third, ten guineas each; and five guineas to the author of design No. 26.

The "Lee's Rest Houses," Hull.

The executors under the will of the late Dr. Lee, of Hull, invited local architects, with a limited number of others, to submit designs in competition for a proposed scheme of Rest Houses. Mr. Edwin Cooper, F.R.I.B.A., was appointed assessor. The result of the competition is announced as follows:—First, Mr. Henry T. Hare, F.R.I.B.A., London; second (50L), Messrs. W. S. Walker & Son, Hull; third (25L), Messrs. Wills & Anderson, London, bracketed with Mr. H. S. East, A.R.I.B.A., London.

Nethertown Institute, Dunfermline.

This competition was instituted in connexion with the Carnegie Dunfermline Trust. The cost of the building was not to exceed 7,000L. Mr. Ernest Auldjo Jamieson, of Edinburgh, was appointed professional assessor, and the following results are declared:—

First premiated design (20L), Messrs. Williamson & Reid, 6, High-street, Inverkeithing; second premiated design (15L), Mr. James D. Cairns, 63, George-street, Edinburgh; third premiated design (10L), Messrs. Walgate & Clough, 13, Lamont-road, Chelsea, S.W. The designs were exhibited at St. Margaret's Lecture Hall, Dunfermline.

Llandudno Police Court.

In the competition for designs for this building Mr. Joseph Holt, F.R.I.B.A., 9, Albert-square, Manchester, was successful.

Welsh National Memorial Sanatorium.

Owing to the expressions of dissatisfaction with the original conditions, the Executive Committee of the Welsh National Memorial to King Edward VII. have decided to dispense with the preliminary competition concerning pencil sketches, and to invite architects at a later date to send in full and completed designs. The new competition will be an open one for plans to be prepared for buildings on the given site, and in the selection the Committee will be assisted by the advice of an assessor.

New School at Northampton.

The Finance Sub-Committee of the Education Committee of Northampton Town Council have decided, subject to the usual sanction, to take steps for the erection of a permanent public elementary school on a site in the Main-road, St. James's District. The school is to accommodate 1,200 scholars in three departments of 400 each, and to have a centre for manual instruction and a centre for the teaching of cookery and laundry work. The Committee have also decided to obtain the designs for the new school from competing architects of the town and county, and to appoint an assessor to adjudicate upon the plans submitted.

ARCHITECTURAL SOCIETIES.

Hampshire and Isle of Wight Association of Architects.

A general meeting of this Association was held at 45, Jewry-street, Winchester, on Monday last, Sir William Portal, Bt., F.S.A., President, and representatives from Portsmouth, Southampton, and Bournemouth being present. After a list of candidates had been brought forward and voted upon (four new members being admitted), the draft rules, temporarily adopted on the formation of the Association last March, were reconsidered in detail and finally adopted with a few alterations. A Council of Management was formed, consisting of the President, the Vice-President (Mr. N. C. H. Nisbett), the Hon. Secretary and Treasurer (Mr. R. M. Lucas), the Assistant Hon. Secretary (Mr. Ingall Sanders), and four Fellows of the Association, namely, Mr. R. E. Chisholm (Portsmouth), Mr. H. L. G. Hill (Winchester), Mr. G. A. Bligh Liversay (Bournemouth), and Mr. Percy G. Stone (Isle of Wight).

In due course the Council will arrange a series of meetings to take place at various towns during the winter months. Information can be obtained from the Hon. Secretaries Bar-gate Chambers, Southampton.

Royal Institute of the Architects of Ireland.

A special meeting of the Council of this Institute was held at the Institute Rooms, No. 31, South Frederick-street, Dublin, on July 1. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair. There were also present:—Messrs. A. G. C. Millar, C. H. Ashworth, G. P. Sheridan, P. L. Dickenson, H. Allberry, F. Hayes, F. G. Hicks, L. O'Callaghan, J. H. Webb, R. Caulfield Orpen, Professor W. A. Scott, and C. A. Owen, Hon. Secretary.

Some correspondence from the Architectural Association of Ireland in connexion with the design of labourers' cottages was read.

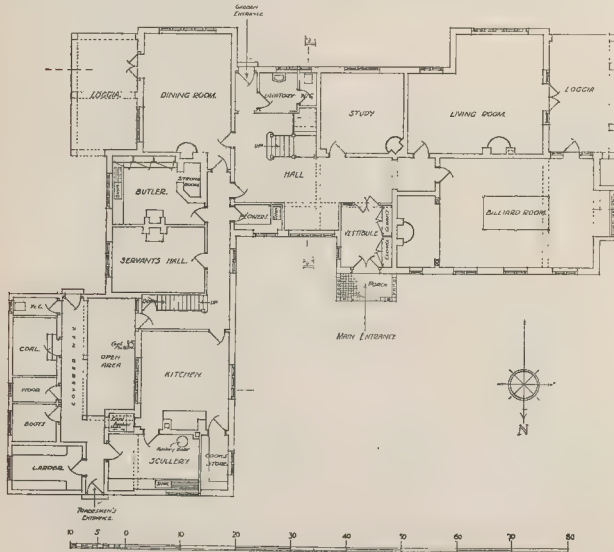

A report was read from the Committee appointed to arrange a public meeting to emphasise the institution of the Chair of Architecture at the National University. It was decided to postpone the matter until October, and the Committee were directed to arrange for a public meeting early in that month. It was decided to hold a special meeting on July 15 to consider the matter.

MONTHLY REVIEW . of . CIVIC DESIGN.

The Liverpool Garden Suburb : House in Fieldway-square.
Mr. G. L. Sutcliffe, F.R.I.B.A., Architect.

THE LIVERPOOL GARDEN SUBURB.

THE land now being developed as a garden suburb by the Liverpool Garden Suburb Tenants, Ltd., in association with Co-partnership Tenants, Ltd., of London, was part of the Marquis of Salisbury's Liverpool estate. It is in the Wavertree district near Broad Green Station, and has an area of about 180 acres, of which the westerly third (see Fig. 1) lies within the City of Liverpool, and the easterly two-thirds within the Urban District of Childwall. Between these two parts of the estate runs a north-and-south ring road 108 ft. wide, designed by Mr. Odie, the City Engineer, and constructed by the Corporation under special powers for a public improvement. That part of the estate which lies within the city boundaries is about 180 ft. above ordnance datum, and nearly level. The Childwall area is undulating. Broad Green Station, on the London and North-Western Railway, is near the north-west corner of the estate, and the Liverpool mainways pass the Picton Clock-tower, which is about a third of a mile west of the estate. For various reasons, among which the drainage facilities and proximity to the tramway route may be mentioned, it was decided to begin work at the north-west corner of the property. Before dealing with the approved lay-out, it will be interesting to refer to Fig. 2, which shows how the land could have been laid out to comply with the minimum requirements of the Liverpool Corporation's Acts and by-laws. If this arrangement had been adopted, the distance between the fronts of opposite streets would have been 43 ft. 3 in., and between the backs 20 ft., and the number of houses per acre would have been about forty-one, with an average frontage of 15 ft., or thirty-four with an average frontage of 18 ft. Back streets 9 ft. wide would have been constructed, and between these and the houses on either side would have been back yards 10 ft. wide, partly paved and partly occupied by outbuildings. In the whole area there would have been no place for outdoor recreation, either for children or for adults, except the streets, and

at the best the use of streets as playgrounds is strictly limited by the police. Every tree would have been cut down, every

blade of grass destroyed, and no place would have been left for a green thing to grow in except narrow strips of so-called "gardens,"

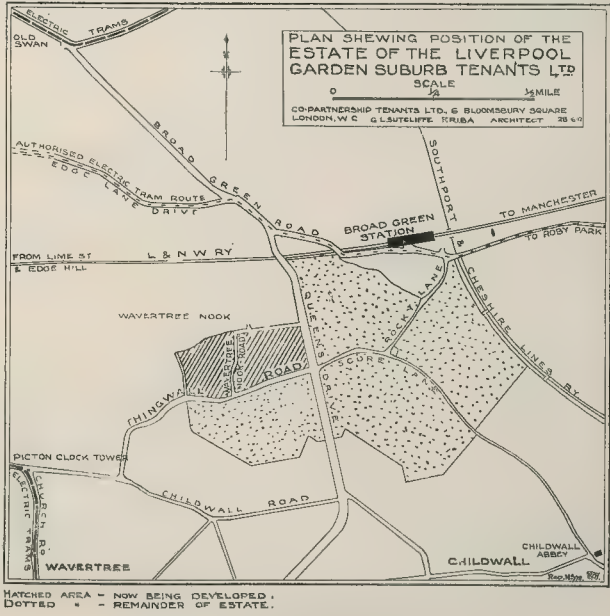

Fig. 1. The Liverpool Garden Suburb.

Fig. 2. Plan showing possible Development of 25 acres in accordance with the Liverpool Acts and By-laws.

mostly 3 ft. 7 in. wide, between the fronts of the houses and the main streets.

This plan is no worse than many which have been actually carried out in Liverpool and other cities and towns. In one or two respects, indeed, it may be better, for it embodies the requirements of the most recent Liverpool Act dealing with streets, namely, the Liverpool Corporation (Streets and Buildings) Act, 1908. Sect. 6 of this Act empowers the Corporation to demand a width up to 80 ft. for new streets which, in the opinion of the Corporation, will form main thoroughfares or means of communication between main thoroughfares. Under this section the Corporation asked for the widening of Thingwall-road to 80 ft. and of Wavertree Nook-road to 50 ft., and for the construction of a new road 60 ft. wide parallel to the western boundary and leading from Thingwall-road to green fields beyond the northern boundary of the estate. Sect. 12 of the same Act provides that no new street more than 150 yds. in length shall be laid out in the city without at least one intersecting street in every 150 yds. thereof, and, further, that not more than thirty houses shall be erected on either side of any such street between any two consecutive intersecting streets. This section was drafted mainly for the purpose of giving more air-space and freer circulation of air around houses, and the two sections taken together enable the Corporation to reduce appreciably the number of houses which can be crowded on a given area. In Fig. 2 the Corporation's requirements under these new regulations are complied with, but even then the number of houses per acre may be as many as forty-one.

Development of a large area on such lines would be a public misfortune—a fact which has been recognised by the Liverpool Corporation for some years. In the Act of 1908, already referred to, an important section (sect. 14) empowers the Corporation to relax the Liverpool Acts and by-laws with regard to the construction of streets in those cases where the owner of a building estate sets apart, "as a garden or open space or . . . as a public garden or recreation ground," a piece of land not less than one-tenth of the estate and not less in any case than 1 acre. The marginal note to the section is "Relaxation of Acts and By-laws," but as a matter of fact the section goes much further than this; not only may the Corporation dispense with the observance of "any of the provisions of any Act or by-law in force within the city relating to paving, metalling, flagging, channelling, or making up of streets," but may themselves at their own expense carry out the work. I do not know whether the Corporation have at any time borne the expense of street construction under the powers conferred by this section; what I do know is that my suggestion that they should do so in the case of the second part of the Liverpool Garden Suburb was not adopted. What the Corporation can do, however, under the section, in the public interest and without expenditure of public money, they are willing to do.

Fig. 3 shows the approved lay-out plan of the first and second areas. The first part to the west of Wavertree Nook-road contains about 11½ acres, and was laid out in 1910 by Mr. Raymond Unwin, F.R.I.B.A. The three short streets leading out of Northway and Wavertree Nook-road, and the two short streets

leading out of Nook-rise, were provided to comply with sect. 12 of the Act of 1908—that is to say, the section requiring an intersecting street every 150 yds. The land lying between Wavertree Nook-road and Queen's-drive has an area of about 14 acres, and has been laid out recently by the writer. In each case the number of houses will not exceed eleven per acre, and more than one-tenth of the area will be set apart as open spaces. It is clear at a glance, however, that the development of the second area represents a different interpretation of the local Acts and by-laws from that which obtained when the plan of the first area was under consideration. The writer's original scheme for the second area showed Fieldway approximately as in the final plan, but, instead of a central square being provided, Fieldway itself forked to the right and left, the former branch curving round to enter Heywood-road at right angles and being crossed by an intersecting *cul-de-sac*, and the latter curving to meet Wavertree Nook-road opposite Nook-rise. This plan afforded facilities for through traffic across the two areas, and was submitted to the Corporation in the belief that it complied fully and clearly with the provisions relating to intersecting streets. The Corporation thought otherwise, and in the end the plan was withdrawn and a new plan on different lines was prepared and ultimately approved. This is shown to a small scale in the right-hand half of Fig. 3, and to a larger scale and in fuller detail in Fig. 4. It has the great advantage, from the economic point of view, of low capital outlay in road construction. The north and south axis of the design is the proposed road called "Fieldway," which is 36 ft. wide (including the grass margins), and will eventually be continued in a straight line to a cricket and football field of about 8 acres on the south side of Thingwall-road. "Fieldway" will then form the connecting-link between this large recreation ground at the south end and "Fieldway-square" at the north end. The road round the square is 18 ft. wide. This axial line is continued northwards by means of a covered way and footpath to Heywood-road, and at right angles to it is another line (passing

through the centre of the square) on which are constructed the paths and covered ways which connect the circular roadway of the square with Wavertree Nook-road on the one hand and Queen's-drive on the other. Each end of this line is to be constructed as an "intersecting street," and another such street is formed by the quadrangle in Heywood-road.

There are at present two ponds in the south-west angle of this area, and the proposed buildings have been kept quite clear of them. The smaller pond will be filled up and the site used for house-gardens. The site of the larger pond is in the middle of an open space, and will probably be drained, partly filled, and used as a sunk playground for children. Other open spaces will be let as allotment-gardens to the Society's tenants. The green in the middle of Fieldway-square is intended for tennis-courts, and the trees around the green, and at the sides of Fieldway will be flowering trees of moderate height; forest trees would eventually darken the houses and obstruct the views. A general view of the square as at present designed appears upon one of our inset plates in this issue.

The development of the first area of 11½ acres is now practically finished. One hundred and twenty-six houses have been built upon it, and a bowling green and two tennis-courts have been laid. A children's playground has been formed and fitted with swings, etc., and allotment gardens have also been provided in addition to the house gardens. Thirty-eight houses are now being built on the second area and other houses will soon be begun. Two old houses have been altered and enlarged to form a club-house or institute, and the Liverpool Education Committee have been for some time negotiating for a school site on or near the suburb.

G. L. STUTCLIFFE.

A SUMMER SCHOOL OF TOWN PLANNING.

ALTHOUGH the town-planning movement continues to develop rapidly, facilities for the systematic study of this important and far-reaching subject hardly keep pace with its growth. With the exception of the school at Liverpool University and the course of lectures at Birmingham University there is so far as we are aware, no other teaching available. Yet there must be a very large number of pupils and assistants in the offices of borough engineers and other officials of local authorities to whom a sound knowledge of the principle and practice of town planning has become a vital necessity. To the borough engineer or surveyor of the future this subject will be of the first importance, and for those who aim at occupying the leading appointments in their profession it would seem to be essential, for it is not to be expected that the corporations of our large cities will in the future appoint officials who are ignorant of a subject which exercises so enormous an influence over the health and happiness of the people.

Recognising the importance of the question and the lack of sufficient teaching, the Bar to Promote the Extension of University Teaching of the University of London is proposing to hold a Summer School of Town Planning at the Hampstead Garden Suburb

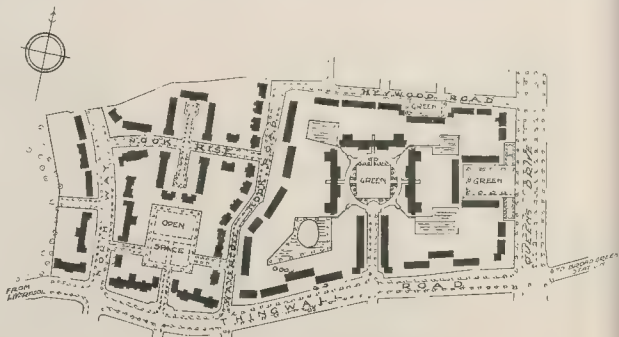

Fig. 3. Approved Lay-out Plan.

from August 3 to 17. Hampstead has been selected as the centre for the School as the results of systematic planning may be studied on the spot, and as further development of the suburb, in connexion with a town-planning scheme being prepared by the District Council of Finchley, is now being put in hand, students will have the added advantage of seeing the actual work in progress.

The prospectus promises a crowded fortnight of lectures on different aspects of the subject by such well-known authorities as Mrs. S. A. Barnett, Professor Adshead, Mr. Henry Vivian, P., Mr. Raymond Unwin, and others, will be arranged for in the mornings, leaving the rest of the day free for visits and excursions to such places as Letchworth, Hampton Court, Greenwich, and the London County Council Housing Scheme at Tottenham. A collection of drawings, plans, and maps will be exhibited, and a certificate of attendance issued with the authority of the London University Extension Board will be given to the members of the school who attend the lectures regularly.

We are glad to see that the social side of the question, which contributes so much to the success of such undertakings, has not been overlooked, and that arrangements will be made to open the Garden Suburb Tennis and Bowling Clubs to the students of the Summer school. We particularly welcome this action of the University of London as further proof of the great interest it is now taking in this subject. It is much to be hoped that the contemplated Chair of Town Planning may now be established so that a systematic course of study may always be open to the students of London and its neighbourhood. We shall watch this experiment with the greatest interest and wish it all success.

THE TRAFFIC PROBLEM: A NEW PROBLEM.

As we slowly progress towards the ideal of new problems and new obstacles arise and all for solution. At present a section of the daily Press is focussing public attention on the traffic problem—a question not by any means new, but since the general application of the motor to everyday purposes, more acute. Recent correspondence has brought to light a singularly selfish point of view on the part of individual users of roads. Each party blames others; the motorist objects to the slower-moving horse, while the carman retaliates with complaints about excessive haste and monopoly of the road; and the cyclist and the pedestrian in turn blame, and are blamed. The problem is full of interest to the student of social conditions, not only on the human side, but also on account of its bearing on the city of the future. The present situation emphasises only too clearly the penalties which must inevitably be paid for the lack of foresight displayed in the creation of new thoroughfares and the want of appreciation of the city's needs both present and future.

The solution of the difficulty might perchance be found in the judicious regulation of traffic by municipal ordinance, limiting the class of traffic and the provision or setting apart of special tracks or hours of passage for the heavier and slower-moving traffic, while for the lighter and faster vehicles using the principal thoroughfares compulsory stopping-places might suffice. These matters, however, are rather temporary measures, but for permanent good the town-planner must be consulted as well as the traffic expert; for this latter has a tendency to regard the appearance of the city as a minor consideration. In one case, recently illustrated, a suggestion was made for a kind of secondary road or viaduct on the roofs of houses—an idea which has obvious objections and is contrary to all ideas of logic and design. A better good will only be attained by the provision of broad main thoroughfares, with clear junctions, planned with the idea of avoidance of collision points, as far as possible. On such roads there would be room for all kinds of traffic, both fast and slow, and there would be more light and air; but in the older part of the city financial reasons would prevent the general adoption of the scheme. If a plan were devised which satisfied such requirements, as has been the case in America, advantage might be taken of the various opportunities which are certain to occur in the future as they have in the past, through rebuilding schemes. With such a scheme as that the New York City Improvement Commissions, or that of the late D. H. Burnham for

Fig. 4. The Liverpool Garden Suburb. Proposed Development of 13½ acres.

Chicago, backed up by the necessary authority from the powers that be, we should be advancing one step, and that without real hardship to any portion of the community.

HOUSING AND TOWN PLANNING IN SCOTLAND.

In their seventeenth annual Report the Local Government Board for Scotland says that during the past year they have every reason to be satisfied with the wide interest shown by local bodies and the public generally in connexion with the administration and execution of the Housing and Town Planning Act, both as regards the facilities provided in Part I. for the better housing of the working-classes, and the much-needed provision in Part II. of controlling the development of towns with the view to securing proper sanitary conditions and amenity. The Board are consulting the local authorities in the mining districts as to whether they have any amendments of the law to suggest to empower them to deal more efficiently with insanitary conditions. They were glad to note that, even apart from town-planning schemes, the Act has given an impetus towards better housing generally that deserved the fullest recognition. For example, their attention had been drawn to the erection on a large scale of miners' cottages in the village of Kirkconnel. On the south bank of the River Nith most of the cottages have a southern aspect, with a small garden plot in front and a garden behind. The gardens are to be enclosed with wooden fences, and the sloping bank of the river will be planted with shrubs. The Sanguhar and Kirkconnel Collieries Company had restricted the number of houses to the acre to fifteen or sixteen cottages, and in addition to these it is proposed to build a hostel to accommodate forty unmarried miners. A similar scheme is also being proceeded with at Valleyfield by the Fife Coal Company. The houses, one story in height, are being built in blocks of twenty-four, and each block forms one side of a crescent, in the centre of which it is proposed to plant a shrubbery. The space connecting the crescents and abutting on the main road, which is 60 ft. wide, is to be reserved for shops. The site is an open one, beautifully situated, with a southern aspect, overlooking the Firth of Forth, and if the miners attend to their gardens the village will form a model for future schemes. The Manor House Powis Coal Company had also consulted the Board in connexion with a village they propose to build at their colliery near Causewayhead, Stirling-shire.

During the year a number of local authorities have given consideration to the town planning portion of the Act, and the Board were encouraged to think that deep interest is being taken in the movement. The scheme for the extension of the Burgh of Dunfermline is of the first importance, the object being the creation of a town on garden city lines in connexion with the operations of the Admiralty at Rosyth.

The Board had had several conferences with the local authority of Inverkeithing in regard to a town-planning scheme. At Gourock and Greenock a Scottish Garden Suburb Company had been formed, and the Board understood that the company have had applications for all houses as soon as they are ready. Consideration is being given in Edinburgh to the improvement of the Canal District of that city. In Dundee three separate areas are being scheduled under town-planning schemes; whilst the Town Council have also before them a great improvement scheme prepared by Mr. James Thomson, the City Engineer, the most interesting features of which are—(1) The widening of the Overgate and a large clearance of existing buildings at the west end of the High-street, with the view of creating an ornamental open space and exposing the west end of the group of city churches; (2) the opening-up of Union-street, showing a boulevard and terminal vista, with monument looking across the Tay; (3) the clearing away of slums behind the Town House for a public market with roof garden; and (4) the creation of a civic centre, to include a City Hall and municipal offices, with a great sweep of river frontage to the south provided with ornamental grounds laid out on reclaimed land. Other towns bestirring themselves are Bo'ness, Buckhaven, Methil and Inverleven, Clydebank, Partick, Pollokshaws, Leven, Rutherglen, and Wishaw. Of private schemes one of the most interesting is the proposed new residential garden suburb being planned on the estate of the Duke of Portland on the Ayrshire coast at Barassie.

NATIONAL HOUSING AND TOWN PLANNING CONFERENCE, 1912 (SCOTTISH SECTION).

A CONFERENCE lasting for two days on the subject of the administration of the Housing and Town Planning Act was opened in the Trades Hall, Glasgow on Tuesday, June 18, and was attended by 230 delegates representative of local authorities from all parts of Scotland and of architectural and other societies. The arrangements were in the hands of Mr. Henry R. Aldridge (Leicester), Secretary of the National Housing and Town Planning Council, and it may be confidently said that any of the delegates who went conscientiously through the large mass of papers and reports provided will have a thoroughly comprehensive knowledge of the administration and application of the Act.

Generally speaking, it may be said that the Conference was a success in so far as it has stirred public opinion in Scotland to an interest in the subject, and the attendance of official delegates from so many burgh councils and local authorities is, we hope, an acknowledgment on their part that they recognise their duties under the Act and their intention to apply the knowledge gained locally. Unfortunately

The Giant's Goblet, Villa Farnese.

(From the Town Planning Review.)

the time allowed for the discussion of the large agenda provided was quite inadequate.

The first day was largely given up to the discussion of administrative questions and the relations of cities to the county districts surrounding them—a subject of particular interest to Glasgow at present in connexion with the proposed extension of her boundaries. The question of roads was also discussed in detail. On Wednesday the Conference devoted its attention to various aspects of the housing question, including the peculiarly Scottish problem of tenement *versus* cottage dwellings. The tenement system came in for strong condemnation, and defence of it was hardly attempted, but we are afraid that condemnation of it as a system will not prevent its continuance. Everybody grants that, other things being equal the tenement dweller would willingly become a cottage dweller if the opportunity were given. The difficulty is that, while it may be healthier and pleasanter, the cottage is dearer and, as a rule, naturally more remote from his place of employment.

It was claimed that greater stability of structure was required in Scotland than is necessary in England, and it is possible that some relaxation of by-laws might be made with absolute safety, but the reason of the excessive cost of small dwellings in Scotland must, we think, be traced to the persistence in the use of traditional methods and materials. How often do we see quite small cottages being erected even only one story high with stone walls 2 ft. thick, which as a preventive to damp will be strapped and plastered internally, making up a thickness of about 2 ft. 3 in. all round, a building possibly not larger than 30 ft. by 20 ft. over all, and which will in wet weather stand as a solid 2 ft. ring of moisture only kept back by the vermin-harbours air space behind the plaster! We fear that the days of the tenement are not yet numbered, but at any rate the public eye is being opened to its evils and with the desire for better will come the supply.

Some figures as to the cost of cottage dwellings were submitted by Mr. A. N. Paterson, the President of the Glasgow Institute of Architects, and these were supplemented by the experience of other architects.

THE "TOWN PLANNING REVIEW."

THE *Town Planning Review* for April, being the first number of Vol. III., begins a new series of examples illustrating notable features of English towns. It leads off with "The New Walk at Leicester," by N. P. Lard, a pedestrian parkway over 100 years old, and "The Revelin Valley-road at Sheffield," by W. Terrey, a

modern municipal improvement opening up a beautiful piece of wild country. This series should form an interesting and valuable feature of this volume.

The present number opens with "Town Planning in Australasia," by Charles C. Reade, which deals with the conditions and the progress made in the principal cities of Australia and New Zealand. It is illustrated by two general views of Adelaide and by maps and plans of the various cities dealt with.

Professor Adshead continues his series of "The Decoration and Furnishing of the City," in which he takes the point of view that "the purpose of the fountain is non-utilitarian; it transcends all mundane ideas. It is a work of art set up for art's sake alone." This article, like the previous ones of this series, is admirably illustrated by examples from different countries, mostly of the Renaissance period, one of which we are enabled by the courtesy of the Editor to reproduce. A fine view of the Medici Fountain in the Luxembourg Gardens at Paris forms the frontispiece to the number.

An article of antiquarian interest is contributed by Edmund Rathbone, being an account of the origin and growth of Deva—the Chester of Roman times—and an essay in restoration of its plan, with some account of its present Roman remains. According to Professor Haverfield, "Deva was from first to last a fortress, always garrisoned by troops, always devoid of organised civic life and municipal institutions, but differing from some

other fortresses by the fact that its garrison consisted of legionary and not auxiliary troops."

This naturally influences the plan, which appears to have been practically a development of that of a camp.

"Some Notes on the Act in Practice," contributed by A. S. Soutar, are of special interest as they are founded on the actual experience of the Ruislip-Northwood Urban District Council in applying the Town Planning Act to the development of the Ruislip Manor Estate; and "Walkley," by Charles Hobson, gives an account of the fifty years' experience of a working man's garden suburb on the outskirts of Sheffield.

"An Introduction to the Planning of Modern Italian Towns," by Professor Adshead, promises in future numbers to analyse and give an historical retrospect of some of the more important Italian towns. The present article is well illustrated by plans and views of Turin one of which we are permitted to reproduce.

"Notes on Current Town-Planning Schemes," by the Editor, includes Southport (with plan), Middleton, Ellesmere Port (with plan), and Newcastle-on-Tyne.

"A Chronicle of Passing Events" is of unusual interest, containing a view of the proposed extension of the Avenue des Champs Elysées and the Avenue de la Grande Armée into the Forest of St. Germain; the premiated designs for the Prestatyn Estate, and the prize designs for a Liverpool reconstruction scheme which was the subject for the Lever prizes at the Liverpool School of Town Planning.

In many ways the most interesting and stimulating article in this number is that of

"The Monumental Qualities in Architecture," by Professor Reilly, being a paper read before the Irish Architectural Association. Taking the Customs House, by Gandon, as his text he examines the conditions and the attitude of mind, mental equipment, and training that made such a building possible, and suggest a return to Gandon's method of education if we would produce similar results. In his analysis of "the qualities we somewhat vaguely sum up in the word monumental," Professor Reilly is not, we think, altogether satisfying. "Here, then," he says, "we have all the qualities which go to making the complete monumental: Perfect unity, mass, great scale, and absolute refinement." Though these fine qualities could no doubt be traced in many monuments, the are surely—with the possible exception of "great scale"—to be found as often in a fine works of architecture, whether monumental or not. Unity, indeed, is the necessary quality of every art conception—it could not be a complete conception without it. We should hesitate also to accept any definition of monument that appeared to exclude such works as the Choragic Monument of Lysicrates on the score of lack of size or of largeness of scale, and we suggest, moreover, that it would perhaps be quite possible to imagine a building which might possess all the good qualities enumerated, and yet not be a monument.

If an architectural monument is the expression of some spiritual idea or emotion in durable form, unity of conception is no doubt an essential but beyond this it might naturally be supposed that a monument would be given just such

Turin: Approach to the Church from the Piazza Vittorio Emanuele.

(From the Town Planning Review.)

magnitude of mass, largeness of scale, and degree of refinement, and no more, as was necessary to exactly express the idea or sentiment which prompted its erection.

This, however, is not the main point of this admirable article, which everyone should read for themselves.

LEADENHALL-STREET IMPROVEMENT.

The City Press publishes a plan showing improvements which involve the widening of Leadenhall-street between its junction with Aldgate and Creechurch-lane. We understand that it was the desire of the Improvements Committee to widen this street to 50 ft. for the whole of its length between Billiter-street and Aldgate, but that it was unable to come to terms with the London County Council. Although far from complete, this improvement is a step in the right direction. A glance at the map of this part of London will reveal its importance. The City is approached from the east by one of the finest of our main traffic arteries, which enters the City proper at Aldgate. Here it bifurcates into two narrow streets, Fenchurch-street and Leadenhall-street, which eventually join again in front of the Royal Exchange, the civic centre of London.

The importance of having these two streets of ample width, so forming an adequate approach from the eastern gate and facilitating the flow of the traffic east and west, needs no demonstration. The ultimate widening of the whole length of Leadenhall-street to the 50 ft. proposed is the least that could be expected.

Where this improvement seems to fall short is that it makes no attempt to deal with the acute angle formed by the junction of Leadenhall and Fenchurch streets. The property acquired appears to have been only just sufficient to enable the widening of Leadenhall-street to be carried out, with the result that the fragments left are shallow and of little value, and the whole of the space of the triangle is cut up into small and awkwardly-shaped sites, which are difficult to deal with in any satisfactory manner.

Had the whole of the triangle been acquired, these awkward sites at the apex could have been dealt with as one block, which would have increased their value and have enabled this angle to have been treated in a fine architectural manner more worthy of its position facing the principal eastern gate and approach to the centre of the City of London.

LONDON IMPROVEMENTS.

The Improvements Committee of the London County Council report that by reason of the heavy charges on the rates for repayment of debt and interest on the Westminster and Strand Improvements, they do not think it wise to recommend any further comprehensive scheme during the current year until the surplus lands on the present improvements are fully developed, although they have improvements in different parts of London now under consideration. The Finance Committee also report that these debt charges have grown from 591,950*l.* in 1901-2 to 965,000*l.* in 1912-13, or from a rate of about 3*d.* in the pound to one of about 5*d.* In these circumstances they recommend the Council to carefully scrutinise all future proposals for improvements schemes of any magnitude, and that the pace at which such schemes are undertaken should be so arranged that the present debt charges are not greatly increased.

CIVIC DESIGN NOTES.

A REPORT issued in 1911 gives an account of the previous year's work of the Art Commission of the City of New York.

In the exercise of its jurisdiction over all works of art to be acquired by the city and over all buildings, monuments, and other structures to be erected on land belonging to the city, the Commission has dealt with some 140 applications during the year under review; out of this number it approved 115.

Among the forty-eight submissions which came under the heading of "Works of Art" are

to be found such matters as a Monumental Approach to Manhattan Bridge, sculpture to be placed in the exterior of New York Public Library and on Bronx Court House, numerous drinking fountains in various parts of the city, a memorial to those who perished in the *Maine* and in the Spanish-American War, and numerous other memorials, tablets, etc.

Among the seventy-three submissions of designs for "public structures" we find schools, bridge shelters, comfort stations, police stations, fences around parks, waste receptacles, etc., giving a great variety of subjects.

One of the most interesting undertakings of the Commission has been the restorations of the old City Hall, built by John McComb in 1810. Some of the principal rooms having been cut up with partitions and otherwise defaced, it was decided to restore them to their original condition. The Governor's room was restored in 1909, and the present report now gives a view of the recent restoration to the Borough President's office, with an account of the work carried out.

From the illustrations, which enable us to compare the designs approved with those disapproved, it is evident that the Commission is doing a most useful work and exercising considerable influence on the general appearance of the city. As we have previously pointed out, it is much to be regretted that similar institutions are not at work in all the principal towns of England.

ALTHOUGH we understand Imperial Delhi, that it has practically been decided not to build the new Imperial Delhi on the Durbar site, we hope that one reason for this decision, given by the *Pall Mall Gazette*, that if this site is built on there will be no suitable place left for another Imperial assemblage, does not represent the ideas of those responsible for the lay-out of the new part of the city.

Apart from its provision for administrative buildings, we should have thought that the underlying idea of such a city would be the creation of a permanent Durbar site architecturally arranged and brought into proper relation to the present city of Delhi. The mere provision of Government offices and residences, leaving the great ceremonial functions that typify the Imperial aspect of the problem to be dealt with in a temporary manner as occasion arises, hardly seems an adequate recognition of the possibilities of the situation.

TOWN-PLANNING enthusiasm, building up its system of aims and conceptions of what is desirable, must beware always of the too facile assumptions, in which the vague well-meanters are so apt to indulge. Too much is glibly assumed to be the ultimately ideal, which, so far from being that, is hardly even to be tolerated as an ameliorative preliminary. An example of this is the hope expressed by the lecturer at the first meeting of the London Society that the maximum height of buildings would be, by statute eventually, at most equal to the width of the street in which they stand. That aspiration, casually thrown out among many such stated or implied, received some faint applause from an audience not beside itself with the heat of a great occasion. It was singled out. Here was something simple they could grasp. Narrow streets! How murky and dismal, in the examples shown,

as compared with some views of mere country, somewhat meretriciously adduced! It is the sort of simple precept that may be repeated and eventually gain such general acceptance as to become a by-law, and then a byword to those who really care. For one knows what would happen. Being the legal maximum, that proportion would become a rule.

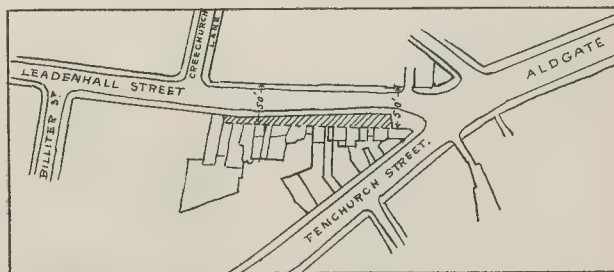

It has been pointed out with some frequency in these columns that civic design, or town planning even, is not a matter of two dimensions, but, like architecture, of three. A town or a street cannot be plotted on paper and staked out on land and then left to be built up to a rule-of-thumb regulation height. Anyone who takes the trouble to investigate the matter will find that a street with buildings forming in section three sides of a square is a very unpleasantly proportioned street indeed—perhaps the worst. On the quality of fine, broad thoroughfares we are agreed; and narrow streets, gaining by contrast, are to the wanderer enchanting. Good, too, for the inhabitant, better than the macadamised wildernesses one so often finds in the suburbs, for instance, and desirable in every way, if only we see to it that the space not wasted in street is properly spent in garden, quiet and private, behind.

Argyll-place and Noel-street improvement now being taken in hand by the Westminster City Council will no

doubt afford some relief to the congestion at Oxford-circus, as vehicles from Regent-street going east will be able to avoid it by making use of Great Marlborough-street. As, however, they will have to debouch into Oxford-street eventually, this improvement will be purely local and not do much towards providing the much-desired relief street which Oxford-street so badly needs. It seems rather a pity that an attempt was made to formulate a more comprehensive scheme to create this. An extension of Conduit-street through to Great Marlborough-street and thence to the north side of Soho-square, and out into Charing Cross-road, would afford relief for a considerable distance, and, considering the class of property involved, would not be prohibitive on the score of expense.

THE Imperial Road Board Conference of came in for a certain amount Road Engineers of criticism at the annual

Scottish district meeting at Stirling in connexion with the Institution of Municipal and County Engineers. In welcoming the delegates, Sir Alan H. Seton Stewart is reported to have said that this august body had put the cart before the horse and insisted on good surfaces to roads, whereas he held it was their first duty to see that they got good foundations to the roads. Mr. D. E. Cox, Road Surveyor to the Central District of Shirlingshire, in a paper dealing with the surface treatment of roads, thought that, although tar macadam might with advantage be used in populous places, it was not advisable to surface tarred metal on a country road with fine tarred material. During a frost such a surface was smooth and required to be regularly sanded to prevent accidents. The merits of "rocmac" and "tar macadam" were discussed and criticism was directed at the action of the Road Board in refusing to give grants for roads laid with "rocmac." The opinion was expressed that strong representations should be made to the Road Board on the subject.

Leadenhall-street Improvement.

THE BUILDING TRADE.

THE INSURANCE ACT.—IV.

IN our last article we dealt with some of the provisions of Part II. of the Insurance Act, which relate to employees, viz., the statutory conditions for receipt of unemployed benefit, the contributions required, and the benefit to be received, but there are other sections which still require notice, and we will, in the first place, consider the rebates or repayments allowed to workmen under certain conditions.

By sect. 99, as we have pointed out before, an employer may come to an arrangement with the Board of Trade both as to workmen engaged through a Labour Exchange and as to workmen in his employ at the date such an arrangement is made, whereby the duties imposed upon the employer under any part of the Act may be undertaken by the Labour Exchange. Where such an arrangement has been made, subsect. (2) provides that all the periods of employment during which a workman engaged through a Labour Exchange is employed by one or more employers with whom such an arrangement has been made, may, subject to regulations to be made by the Board of Trade on the application of the workman, be treated for the purposes of his contributions under Part II. of the Act, as a continuous period of employment under one employer, and those regulations may provide for the refund of part of his contributions. Rule 34 of the Unemployment Insurance Regulations, 1912, deals with the amount to be refunded. The employers will have made the same deductions from the workmen's wages as if no such arrangement existed, but the workman can make application to a local office for the difference between the amounts so deducted and the sum that would have been deducted had he been continuously employed under one employer during the same period.

This section seems full of difficulties. The workman gets an advantage in being treated as continuously employed, but this advantage, as we pointed out in our article, June 14, is dependent upon the employer exercising an option in which the workman has no voice. Then supposing a workman to work for three employers in a week, two of whom have entered into such an arrangement but the third has not, does that break the claim of continuity?

Sect. 95 also contains provisions relating to the repayment of contributions to workmen. If a workman or his personal representatives show to the satisfaction of the Board of Trade that the workman has contributed under this part of the Act for 500 weeks or upwards, and that the workman had attained sixty years of age, the amount by which these contributions exceed the amounts received by him out of the unemployment fund, together with compound interest at 2½ per cent., can be claimed.

By subsect. 2 a repayment under this section does not affect the workman's liability to go on paying contributions under this part of the Act, and if after such repayment he has to claim benefit, the contributions in respect of the period covered by repayment are to be calculated as "the full number of contributions which is most nearly equal to five-eighths of the number of contributions actually paid during that period." In other words, the employers' contributions and the State subsidy are still held to his credit. Sect. 105, which enables arrangements to be made between the Board of Trade and associations of workmen who by their rules pay unemployed benefit to their members, we need hardly consider in detail here except to notice that Rule 10 of the Unemployment Insurance Regulations, 1912, provides a special procedure where workmen apply for unemployment benefit, and that when a claim for repayment is made under sect. 99 by workmen engaged through a Labour Exchange the proviso to Rule 34 enacts that no workman shall be entitled to any repayment in respect of any contributions which have already been taken into account for the purpose of determining the amount of unemployment benefit to which he may be entitled, or the amount which may be repayable under sect. 105 to an association in respect of that workman. Subsect. 2 of sect. 100 enacts that regulations

shall be made providing for the return to workmen and employers of any contributions paid under a misapprehension that the workman was employed in an insured trade, but in the case of workmen any benefit received is to be deducted. Rule 31 deals with these applications.

Under sect. 91 (a) regulations may be made for permitting workmen who are employed under the same employer, partly in an insured trade and partly not in an insured trade, to be treated with the consent of the employer as if they were wholly employed in an insured trade.

Rule 35 represents these regulations, and simply provides that where such an arrangement has been come to between employer and workman the contributions shall be deemed to have been paid in respect of employment in an insured trade.

It is not clear whether such an arrangement would prejudice the right to refunds, but we assume from the wording of the rule that these contributions are to be treated in every way as if they had been made in respect of workmen wholly engaged in insured trades.

Under sect. 91 (f) regulations may also be made for providing that "where any workmen are employed in or for the purposes of the business of any person, but are not actually employed by that person, that person may be treated for the purposes of this part of the Act as their employer, instead of their actual employer, and for allowing that person to deduct from any payments made by him to the actual employer any sums paid by him as contributions on behalf of the workman, and for allowing the actual employer to recover the like sums from the workman." We quote this subsection in full, for it is impossible to paraphrase such a complicated piece of legislation, and the rule made under the subsection, viz., Rule 36, is even more confusing.

The side-note to the rule is "Workmen employed by one person for purposes of business of another." The person originally employing the workman is termed the "Immediate Employer," the other person is called the "Substantial Employer," and the rule provides that if workmen employed in an insured trade are employed in or for the purposes of the business of the "substantial employer" by some other person who "himself works wholly or mainly by way of manual labour" in that business, the "substantial employer" is for the purposes of this part of the Act to be treated as the employer. The "substantial employer" may deduct from any payments due from him to the immediate employer any sums paid by him as contributions on behalf of the workmen, and the immediate employer may deduct from the workmen's wages any sums so deducted. We can offer no satisfactory explanation of this subsection or the rule. They possibly refer to subcontractors, but they are very intricate.

The sections of the Insurance Act which relate to unemployment insurance are sects. 84 to 107, and it is this small portion of the Act, known as Part II., which we have with such indifferent success endeavoured to explain to our readers. Ninety-four sections of the Act relate to health insurance in terms, which are no less complicated than those we have been considering. The Act may surely be characterised as a wholly unprecedented piece of legislation. The Statute Book contains many statutes of considerable complication, but "minikin pin" legislation such as this is a new and, we think, a very undesirable departure. It is not legislation, and it is not "business." It places not only a burden upon industry—industries are constantly being burdened by domestic legislation—but a clog. The employer has, in the first instance, to bear the whole charge imposed by the Act, and if he desires to recoup himself of the portion properly to be borne by the workman he has to solve a series of puzzles and also to risk estranging his workman. The workman must qualify in high mathematics to understand the benefit he is entitled to, an army of officials has to be engaged, and rules and regulations are issued in sheaves, and the total result is that each adult workman can only receive in

twelve months fifteen weeks' unemployment benefit or a sum of five guineas at maximum. Was there ever such a "pothor about so small a matter? The mountains have brought forth, and behold! The "ridiculous mussy" which we may be pardoned for translating as the "ridiculous muss." This is not "grandmotherly legislation," it would be an insult to our forbears so to designate it. It is "minikin pin" legislation, and when in practice it will not hold the industrial fabric together, but will inflict a series of prickings on those engaged in industry. We are in no way opposed to the principle of insurance, but we should wish at least to see it applied to business men on business principles.

LAND VALUATION.

DURING the recent debate on land valuation the Chancellor of the Exchequer made an important announcement that an inquiry by experts into the administration of the Act should be instituted at once, the terms of the reference being as follows: "To inquire into the working of the valuation prescribed by sect. 26, subsect. 1, Part I. of the Finance Act, 1910, and to report whether any modification of the machinery carrying out that valuation are necessary, and, if so, what modifications. This subsection provides that the Commissioners shall as soon as may be after the passing of the Act cause a valuation to be made of all land in the United Kingdom showing separate the total value and the site value respectively of the land, and in the case of agricultural land the value of the land for agricultural purposes, when that value is different from the site value, and it is provided that land separate occupation shall be valued separately if the owner so desires.

Having regard to the provisions of the section and the terms of reference, it may be doubted how far the Commission will be able to inquire into those questions which are the cause of hardship and complaint under the Act. The allusion to machinery for carrying out the valuation rather suggests that the inquiry will be limited to ascertaining whether the total value and the site value of land are being determined as expeditiously as may be and with as little friction as possible, whereas the point in issue are more deeply-seated than that.

The main point from the builders' point of view is, What is to be deemed increment? Is every increase in the value of the land as the houses placed upon it to be deemed increment quite apart from local conditions? What is to be deemed profit as distinguished from increment? Increment was described when the Finance Act was being passed as an increase in value due to the community—i.e., either exceptional demand or an increase in value through the improvement in a district due to outside causes. It is noticeable in the debates Ministers always cite example of "windfalls." Mr. Masterman did so on the occasion, citing 9½ acres purchased at 25 two years ago, and 1 acre of which, required by a public authority, was sold for 605£. These are the cases brought before the House by Ministers, and if increment value duty was only levied in such cases we imagine very little complaint of the Act would be heard in the House or throughout the country, but where cases of hardship are brought to the notice of Ministers no satisfactory assurance is forthcoming.

The fact is that the Finance Act contains no definition which limits increment value duty to that which it was described to be when the Bill was introduced, and the complicated provisions for valuation do not ensure the tax being levied on such a basis. We deprecate the use of the word "trickery" in connexion with the Act and its administration, but unlooked-for results have arisen under the Act, and it is an inquiry into these results which is required. The Chancellor of the Exchequer intimated clearly that the policy of the Government as expressed in the Act would not be the subject of investigation by the Committee, and we fear, therefore, that the proposed investigation will serve but little purpose.

We cannot leave this subject without noticing the statement made by Mr. Masterman that the building trade is more prosperous than it was before the Act was passed. This assertion was based upon statistics which are not reliable for such a purpose, as we pointed out in our issue for December 29 last. The figures quoted relate to trade union returns for carpenters and joiners, and the returns are compared with the years 1908-9, which were exceptionally bad years. Those two years are invariably isolated by Ministers for the purposes of comparison, but the previous years show far less unemployment even for carpenters and joiners, and in 1898 only 0.9 were unemployed. Carpenters and joiners do not alone represent the building trade, and even in their case the returns take no account of the men who have dropped out of the unions owing to continued hard times. This was fully recognised in the actuarial report made last year for the purposes of the Insurance Act, a document with which Ministers should be fully acquainted.

CONCRETE-MIXERS:

THE MASON MIXER.

This machine is of the continuous type, and consists essentially of a long, tapering cylinder trued inside with ribs, and rotated by gearing arranged as shown by the accompanying illustration.

The feed-hopper is attached at the smaller end of the cylinder, and water is admitted at the same end through a pipe passing down the cylinder. The discharge shoot is at the larger end of the cylinder.

The machine is made in two sizes, and can be supplied for operation by belting from any convenient source of power.

The makers are Messrs. Mason Brothers, of Leicester, who also manufacture pan-mixers for mortar or concrete and several types of stone-breaking machinery.

CONTRACTORS' MATERIALS.

In carrying out a contract for large works the contractor must needs find large quantities of materials. Whether he supplies them himself or obtains them from third parties he is under the same obligation. He must guarantee them all. That is bound to be one of the burdens of the contract, and it is necessary to study the clauses with some care in order to see that the contractor is not called upon to undertake a burden which is too onerous.

Delay Enhancing the Price of Materials.

If there is delay in commencing the work which is due to the fault of the employer, and the builder is consequently forced to expend larger sums on materials than he would otherwise have done, he may recover the difference. For instance, suppose a contract was entered into for the erection of a pier, the work to be commenced in June, 1912, and finished in two years from that date. Relying on his work commencing in June the contractor would naturally order cement as at the prices ruling in that month. Therefore, if the employer made delay in giving possession of the site, or was guilty of other default which rendered it impossible for the contractor to commence work for six months, the employer would have to make good to him. (See generally *Drew-Bear v. The Pancras Guardians*; *Emden's Building Contracts*, fourth edition, p. 684.)

Increased Cost of Haulage Owing to Delay.

Delay which is sufficient to carry the commencement of a contract over from summer to

winter may also prove expensive to the contractor in relation to materials. He will be responsible for haulage; and where haulage has to be conducted along country roads it is manifest that the expense is much greater in winter than in summer, especially when as a result of the haulage of heavy waggons the contractor may be made liable by the local authority for extraordinary traffic. Due warning should, of course, be given to the employer that his refusal to allow the work to commence at the proper time will occasion loss to the contractor.

Supply of Some of Materials by Employer.

Of course, if the contractor undertakes to build with the employer's materials he is under no obligation in respect of them. He cannot be taken to guarantee them. For instance, if a building owner were to say "there is a quarry in my grounds from which I want to procure all necessary building stones," or "there is a bed of sand available here and you must use that for making concrete." In both these cases the builder would not be liable for defective materials unless it could be shown that the materials were so bad for the desired purpose that it was his duty as professional adviser of the building owner to point out this fact to him.

Where the employer has agreed to supply part of the materials he is entitled to deduct from the contract price the value of the materials so supplied. (*Newton v. Foster*, 12 M. and W. 772.)

Where Performance Prevented by Employer.

When the employer interferes so as to prevent performance of a contract it is obvious that he must pay damages; and the measure of those damages is the amount of profit which the contractor would have made had he been allowed to complete the work. That profit is arrived at by taking the difference between what the performance would have cost the builder and the price which the employer agreed to pay. A fair deduction must, of course, be made from the contract price in respect of the value of materials which have never been served and wages which have never been paid. (See the American case of *Mashoten v. Mayor*, etc., of Brooklyn; 7 Hill N. Y. R. 61.)

Right of Clerk of the Works in Relation to Materials.

It has been decided that the clerk of the works who is employed in connexion with a building contract may be vested with authority to reject materials. In *Graham v. the Commissioners of Works* ("Emden's Building Contracts," fourth edition, p. 670.)

The Master of the Rolls, in giving judgment, said: "It is perfectly obvious as a matter of business that one cannot expect an architect to go into every detail himself, and I have no hesitation in holding on the authorities that the architect, having himself first ascertained that the timber being used is not of the stipulated quality, is perfectly entitled to delegate the duty of particularising which of the timbers must be removed."

THE TRADE UNION BILL.

The Employers' Parliamentary Council has issued a very instructive circular on the subject of the Trade Union (No. 2) Bill, which Bill proposes to confer political powers on trade unions and to do away with the effect of the decision in the House of Lords in the celebrated *Osborne* case. We dealt with this Bill in our columns on May 24 last, and the circular is addressed to one of the points we drew attention to in that article, viz. the position of trade union members under this Bill if they elect not to contribute to the political objects of the

union. The Bill purports to safeguard the rights and interests of such members, the payments for political objects are to be made out of a separate fund, members are to be at liberty to intimate that they do not desire to contribute to this fund, and if they do so object the Bill provides that benefits are not to be withheld from them and that they are not to be placed under any disability or any disadvantage compared with other members except in relation to the control and management of the political fund. Such are the terms of the Bill, but the point raised in this circular is if a non-subscribing member is deprived of benefit or placed under some disadvantage in consequence of his refusal to subscribe to the political objects of his union, what steps can he take to secure the benefits which he has been deprived of?

As readers of our columns well know, the Trade Union Act of 1871, by sect. 4, prohibits the Courts from entertaining any legal proceeding instituted with the object of directly enforcing or recovering damages for the breach of any agreements, relating amongst other objects "to provide benefits to members." In the circular under consideration there is a very careful review of all the decisions that have been given under this section, and the conclusion arrived at is "That a member of a trade union which before the Act of 1871 would have been illegal at Common Law as being in restraint of trade cannot by any process whatever recover anything from his union if it refuses to pay." We entirely agree with this statement so far as it goes; no legal process is open to the workman if benefit is withheld, but there is some doubt whether the statement even goes far enough, as since the decision of the House of Lords in *Russell v. The Amalgamated Society of Carpenters* (the *Builder*, April 5, 1912) there is some doubt whether the Courts have any jurisdiction to enforce an agreement to provide benefits even in the case of unions whose objects are not illegal as being in restraint of trade. In the recent case of *Thomas v. Portsmouth: a Branch of the Ship Construction, etc., Association* (the *Builder*, April 26), it will be remembered that the judges of a Divisional Court so interpreted the decision of the House of Lords.

This only strengthens the case made out in the circular before us, as it is questionable whether the Courts can exercise any jurisdiction over any trade union at all in such matters.

In the second *Osborne* case the Court of Appeal held that if the plaintiff was wrongfully expelled from his union which, as was held in that case, was not a union illegal at Common Law (see the *Builder*, March 24, 1911), the Court had jurisdiction to declare the resolution of expulsion *ultra vires* and to grant an injunction, but, as the circular points out, even if membership can be enforced, that is no safeguard to the member unless the benefits of membership can also be claimed. The circular thus draws attention to the point made in our former article that the safeguards provided in this Bill to members who do not subscribe to the political objects which the unions are to be allowed to espouse are, in fact, no safeguards at all, and we may reiterate that if this Bill is to become law it is essential that access to the Courts should be open to any members of the unions who are deprived of rights or are prejudiced in any way in violation of the terms of the Bill.

We find nothing in this circular on the second point which we made in our article of May 24, and which is hardly of less importance. Grave doubts have arisen whether sect. 4 of the Trade Disputes Act, 1906, prohibits the Courts from entertaining actions of tort against trade unions generally, or only when the tort in question has been committed in contemplation or furtherance of a trade dispute. For some reason this qualification was omitted from the subsection, although in other sections the words "in contemplation or furtherance of a trade dispute" appear. Before political powers are conferred upon trade unions as is proposed by this Bill it is of paramount importance that these doubts should be set at rest and subsect. 1 of sect. 4 of the Trade Disputes Act be strictly limited to torts in contemplation or furtherance of trade disputes, if it be not repealed altogether. It would be too preposterous if trade unions could be guilty of torts in connexion with political elections, and that his Majesty's subjects who have had their windows broken or even suffer more serious injuries in an election should have no power to seek redress in the Courts.

Mason's Continuous Concrete-Mixer.

A NEW AND IMPROVED METAL LATHING FOR PLASTERWORK.

We call attention to the announcement which appears on page xv. in our advertisement pages stating that the Expanded Metal Company, Ltd., of York Mansion, York-street, Westminster, S.W., and Stranton Works, West Hartlepool, has succeeded in producing a new and improved diamond mesh expanded metal lathing, which will be obtainable at prices lower than those for the original expanded metal lathings. The new lathing is made under a recently patented process. It will be known by the trade name of "BB Expanded Metal" lathing, and the illustration shows the actual size of its meshes. It is made in standard size sheets, 9 ft. long way of mesh by 2 ft. short way of mesh, which is an increase of 1 ft. in length as compared with the original lathings.

"BB Expanded Metal" lathing has important advantages over the original expanded metal lathings—its cost is less, and it may be used with wider spacings, and requires less plaster.

Practical tests have been made under ordinary working conditions by well-known expert plasterers who are familiar with the original lathings, and their reports agree that not only is the new lathing stronger and stiffer than the original, but that, on account of the reduced size of the diamond mesh, together with the improved slope of its strands, less plaster goes through to form the "key," and practically none falls off and is wasted.

"BB Expanded Metal" lathing is now ready for the market, and as it is sold through the merchant trade only stocks will be held in most large centres.

It is listed in three gauges, thus:—
BB 26-gauge expanded metal lathing: D13 24-gauge expanded metal lathing: BB 22 gauge expanded metal lathing.

Reference to the price list issued by the Expanded Metal Company, Ltd., shows that, gauge for gauge, a saving of from 25 per cent. to 60 per cent. is made by substituting the new lathings for the old. But the saving in cost is really more than the difference between the price list rates for equivalent gauges, because of the wider spacings that may be used with the new lathings.

Tests have been made at these wider spacings with entirely satisfactory results, both with ordinary lime and hair mortar and with special quick setting plaster.

GENERAL BUILDING NEWS.

ST. JOHN'S CHURCH, OLD COLWYN.

The new tower which is being added to this church will have accommodation at its base for about 100 people, and the lettering on the foundation-stone, which was laid last week, is the work of Mr. W. Wainwright, sculptor, of Colwyn. The architects are Messrs. Douglas, Minshull, and Musprat, of Chester.

CHURCH HALL, BLAYDON.

Messrs. Clark & Moscrop, of Darlington, are the architects for this hall, which is being erected at a cost of 2,700. The hall will contain a drill hall, billiard-room, classrooms, clubroom, etc., and on the first floor is an assembly hall, seating 350 persons. The contractor for the work is Mr. H. Smith, of Ashington.

WATER SCHEME, GOUBROCK.

Mr. A. Leitch, of Glasgow, has been appointed by the Gourock Town Council Engineer for the new water scheme at Duff Burn. The estimated cost of the work is 20,000*l.*, and the reservoirs will be constructed at the junction of the Duff and Gilmet Burns.

MARCONI WORKS AT CHELMSFORD.

The new works at Chelmsford for the Marconi Wireless Telegraph Company were opened on June 22. Messrs. Dunn & Watson were the architects.

NEW BUILDINGS IN LONDON.

Rebuilding Rising Sun public-house, Blackfriars-road, S.E. Building, corner of Holborn and Furnival-street, E.C.; Messrs. Rice & Sons, builders, 15, Stockwell-road, S.W. Alterations to Nos. 90 and 91, High-street, Deptford, S.E., for the London, City, and Midland Bank, Ltd.; Mr. H. L. Holloway, builder, Church-street, Deptford, S.E. Extensive building, corner of Bryanston-street and Old Quebec-street, W.; Messrs. Chinchin & Co., builders, Harrow-road, Kensal Green, W. Additions to Lord Elphinstone's Mansion, 6, Upper Brook-street, W.; Mr. W. H. Windsor, architect, 48, Bedford-row, W.C. Warehouse for Midland Furnishing Company, Gough-street, W.C.; Messrs. Worley & Turner, architects, Avenue-chambers, Bloomsbury-square, W.C. Elementary school, Isleworth, W.; Mr. G. I. Carey, Council House, Hounslow.

NEW LIBRARY, STOCKWELL ORPHANAGE.

On the 19th ult., on the occasion of the Annual Festival at Stockwell Orphanage, Clapham-road, the late Lord Mayor, Sir T. Vezey Strong, attended at the opening of the new library, which has just been completed at the Orphanage. The architect is Mr. Robert Milnes, P.A.S.I.

CADETS' HEADQUARTERS, WANDSWORTH.

It is proposed to erect new headquarters for the National Naval Cadets on an island site in the Wandsworth-road. The area of the site is 13,000 sq. ft., the frontage to the road being 100 ft. The estimated cost of the scheme is 10,000*l.*, and the building is to be designed by Mr. T. Marcus Houghton.

PREMASENS' HALL, PLYMOUTH.

A new hall is to be erected for the Plymouth Freemasons, from the designs of Mr. W. A. Vercoe, A.R.I.B.A., architect, of Plymouth, and the building will include a lodge-room 50 ft. by 26 ft. to hold 250; a refectory, kitchen, cloak and retiring rooms. The builder is Mr. F. Wakeham.

TRADE NEWS.

Under the direction of Mr. George H. Sands, architect, Lisburn, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent air-pump ventilators and air inlets, has been applied to the Infirmary wards, Lisburn Union Workhouse, Lisburn.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Construction.

Camberwell, North.—Erection of an iron and glass shelter at a building known as the Grand Hall, Camberwell New-road, Camberwell (Messrs. F. Matcham & Co. for Mr. F. W. Parcell).—Refused.

Chelsea.—Temporary wood and iron building on the southern side of Elm Park-road, Chelsea (Rev. R. H. Keable).—Consent.

Deptford.—Shed of a temporary character at the rear of No. 56, Peys-road, New Cross, next to Musgrove-road (Mr. J. G. Kennard).—Consent.

Hackney, North.—Temporary wood and glass shelter at the rear of No. 14, Heathlands-road, Stoke Newington (Mr. F. W. Rhodes).—Consent.

Hackney, North.—Iron staircase in front of a warehouse building on the northern side of Barrett's-grove, Hackney, eastward of Cressington-road (Mr. J. H. Storrar for Messrs. Van den Burgh).—Refused.

Hackney, South.—Addition at the rear of No. 95, Rushmore-road, Lower Clapton (Mr. J. Coddington for Mr. T. Webb).—Refused.

Hammersmith.—Temporary wood and iron office building and a wooden signboard at premises on the northern side of King-street, Hammersmith, between Nos. 318 and 324 (Mr. J. B. Pinchbeck).—Consent.

Hampstead.—Iron and glass shelter in front of "White Friars," Chislet-road, Hampstead (Mr. N. M. Shimborg).—Consent.

Kensington, South.—Building of a temporary character at the rear of No. 10, Pitt-street, Kennington, next to Gordon-place (Mr. C. F. Rey).—Consent.

Kensington, South.—Temporary wood and iron building at the rear of No. 98, Palace Gardens-terrace, Kensington (Messrs. Humphreys, Ltd.).—Consent.

Lewisham.—Temporary wooden shed upon a site on the south-eastern side of Boveney-road, Lewisham (Messrs. Bingham & Broughton for the Forest Hill Wesleyan Church Lawu Tennis Club).—Consent.

Marylebone, East.—Temporary wood and glass bookstall at the Marlborough-road railway-station, abutting upon Finchley-road and Queen's-road, St. Marylebone (Messrs. W. H. Smith & Son).—Consent.

Norwood.—Wood and iron building in front of No. 128, Norwood-road, Norwood (Mr. E. Carr for Mr. W. Haley).—Refused.

Peckham.—Temporary shed in front of No. 10, Harders-road, Peckham (Mr. E. H. Whit).—Consent.

St. Pancras, South.—Retention of advertisement handbills abutting upon Euston-road, Mabledon-place, and Bidborough-street, St. Pancras (Mr. Walter Hill's Billposting Department, Ltd.).—Consent.

St. Pancras, South.—Erection of an iron and glass shelter at the entrance to No. 36, Tottenham-court-road, St. Pancras (Messrs. O. C. Hawkes, Ltd.).—Refused.

Strand.—Iron and glass shelter at entrance to Nos. 1 and 2, Coventry-street, No. 1, Wardour-street (Messrs. Emden, Eg & Co. for Mr. H. Appenrodt).—Refused.

Wandsworth.—One-storey wooden motor-hall of a temporary character at No. 14, Hope-road, Streatham (Mr. H. Huber).—Consent.

Wandsworth.—One-storey building at the rear of No. 36, Streatham hill, Streatham W. H. Edwards).—Consent.

Lines of Frontage and Projections.

Greenwich.—Addition at the rear of "Royal Standard" public-house, Vauxhall Park, Blackheath, next to St. John's-road (E. Faux for Messrs. Courage & Co., Ltd.).—Consent.

Hackney, North.—Building on the south side of Springfield, Upper Clapton, eastward of No. 8, Springfield (Mr. H. Brookings for Mr. A. E. King).—Consent.

Kensington, South.—Additions to the pavilion at No. 16, Cromwell-crescent, Kensington (C. E. Wilkinson).—Consent.

Lewisham.—Six houses on the eastern side of Honor Oak-road, Lewisham (Mr. F. Rosser for Mr. T. Turner).—Consent.

Paddington, South.—Addition to the existing portion of Nos. 99-92, Westbourne-grove, Paddington (Messrs. G. Billings Wright & Co.).—Consent.

St. George, Hanover-square.—Projection sign in front of No. 45, New Bond-street, St. George, Hanover-square (Messrs. Lemaître Consul).—Consent.

St. George, Hanover-square.—Projection iron and glass sign in front of the "Wine Castle" public-house, Vauxhall Bridge-road, St. George, Hanover-square (Booth's Distilleries Ltd.).—Consent.

Strand.—Projecting sign at No. 5, Coventry-street (Messrs. F. Sage & Co., Ltd., for Messrs. Marcovitch & Co., Ltd.).—Consent.

Wandsworth.—Erection of two houses on south-western side of Upper Richmond-road, Putney (Messrs. Nevins & Newton for Mr. Leuch).—Consent.

Woolwich.—Erection of a one-storey shop front of 173, Plumstead Common-road, Woolwich (Mr. W. Pearman for Mr. B. Dallad).—Consent.

Width of Way.

Bermundsey.—Erection of an addition at the rear of the "Prince Alfred" inn, beerhouse, 24, Alfreton-street, Southwark (Messrs. Purvis & Purvis for the Commercial Brewery Company, Ltd.).—Consent.

Clapham.—Retention of a one-storey building at the rear of No. 16, Old Town, Clapham (Mr. E. H. Henry for Colonel W. Bowyer).—Consent.

Kensington, South.—Greenhouses at No. Holland-place, with a boundary fence (E. W. Curry for Mr. W. F. Flagdgate).—Consent.

Poplar.—Erection of a building at No. Orchard-place, Poplar (Mr. C. Living, Jr. for the Thames Sack and Bag Company, Ltd.).—Consent.

Southwark, West.—Erection of a building upon a site abutting upon Cathedral street Winchester-square, London Bridge (Mr. M. Matts for the Proprietors of Hay's Wharf).—Consent.

Strand.—Erection of a projecting shop front of Nos. 8 and 10, Shorewood-street, Westminster (Mr. A. H. Attwater for Mr. Woolfe).—Consent.

Walworth.—Erection of an addition to John's Church, Larcum-street, Walworth (Messrs. Greenaway & Newberry for Mr. J. C. Morris).—Consent.

Cubical Extent.

Peckham.—Additional cubical extent in respect of a garage addition to abut upon Nunhead-lane, and a roadway leading to Nunhead-lane, Peckham (Mr. G. A. Lans for the National Steam Car Company, Ltd.).—Consent.

Rotherhithe.—Proposed addition between blocks P and K at the premises of Messrs. Southwell & Co., Ltd., Bermondsey-wall Jacob street, Rotherhithe (Mr. W. T. Walcott for Messrs. C. Southwell & Co., Ltd.).—Refused.

Width of Way, Space at Rear, and Projection.—Re-erection of Lower Log Branch-hill, Hampstead (Mr. J. Hudson for Mr. H. C. Braun).—Consent.

Width of Way and Construction.

Hampstead.—Erection of a temporary summer house at the rear of No. 2, F. Avenue, Hampstead, next to Well-road (Messrs. Hampton & Sons, Ltd., for Mr. A. Kilver).—Consent.

Space at Rear and Alteration of Building.—Margybone, West.—Alterations and erection of an additional story at No. Manchester-square, St. Marylebone (Mr. Martin for Sir Anthony Bowly).—Consent.

Width of Way and Lines of Frontage.
Westminster.—Wood, iron, and tile covering ladders in front of the premises of the my and Navy Auxiliary Co-operative Company, Ltd., Regency-street, Westminster (F. J. Barrett).—Consent.

Uniting of Buildings.
Chelsea.—Uniting of Nos. 165, 166, and 167, pancake-street, Chelsea (Messrs. Slaughter and Co., Ltd., for Messrs. C. Hammond, Ltd.).—Consent.

Holborn.—Double doors of special construction in lieu of double iron doors to openings division walls at the premises of Messrs. Gamage's, Ltd., Leather-lane, Holborn (Fireproof Doors, Ltd., for Messrs. Gamage's, Ltd.).—Consent.

Holborn.—Uniting of Nos. 106 and 107, High Holborn, with premises at the rear upon the 10 of Nos. 9, 10, and 11, Eagle-street, Holborn (Messrs. R. Coles & Sons for Mr. T. H. Onshaw).—Consent.

Kensington, South.—Uniting of Nos. 27 and Emperor's gate, Kensington (Mr. A. Wickins).—Consent.

Whitechapel.—Uniting of Nos. 5 and 6, Talbot Blackheath, northward of Blackheath (Messrs. R. Coles & Sons for Mr. T. H. Onshaw).—Consent.

Marylebone, West.—Formation of openings for the party wall between Nos. 75 and 76, High-street, St. Marylebone, at the ground and floor levels (Mr. A. J. Hopkins).—Consent.

The recommendations marked * are contrary to the provisions of the Metropolitan Borough Acts concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Warehouse for Messrs. Dunnington & Co., jewellery manufacturers (2,500); Messrs. Wilson & Walker, architects, 181A, Union-street, Aberdeen.
Belfast.—Memorial extensions to Royal Victoria Hospital; Mr. R. J. Mordie, Lord Mayor of Belfast, Treasurer of Building Fund, Belfast (4,500); Mr. J. S. Mordie, builder, Back Spring-terrace, North Belfast.

Birmingham.—Rebuilding Black Horse Hotel (850); Mr. C. A. Bulley, builder, Willow-wood, Chislehurst, Kent.

Blackburn.—Rebuilding tower of Mill Hill (1,200); Mr. J. T. Henshaw, architect, Blackburn.

Blackburn.—Thirty houses; Mr. H. Armory, builder, Lydia-street, Welling, Co. Durham.

Blackburn.—School (4,000); Mr. W. Rushworth, Architect, Shire Hall, Blackburn.

Blackburn.—Extension of works Messrs. Wilkinson & Newsholme, wool works.

Blackburn.—Extensions to premises, Newgate, for the Hoffman Manufacturing Company, Ltd., cycle fittings manufacturers.

Blackburn.—Extensions to infirmary (40,000); Messrs. J. W. Small, Shire Hall, Derby.

Blackburn.—Boys' home (2,740); Mr. W. D. Small, builder, Whitburn.

Blackburn.—Additions to foundry, Wharfedale, for Messrs. P. & C. Garbutt, Ltd., on waste machinery manufacturers; Messrs. R. Castle & Son, architects, Cleckton. Outbuildings at chemical works for Messrs. Howarth & Howarth.

Blackburn.—Extension of works of Messrs. Brown & Co., Ltd., shipbuilders (7,000); Messrs. J. W. Small, Shire Hall, Derby.

Blackburn.—Residence (500); Mr. Owen C. Little, architect, 5, Ford-row, W.C.

Blackburn.—Proposed public abattoir; Mr. E. Schindler, Surveyor, Town Hall, Derby.

Blackburn.—Additions to sawmills, Veda's, for Messrs. W. White & Sons, steam chisellers, 128, High-road, Cowes.

Blackburn.—Twenty houses (2,900); Mr. Crane, builder, 96, Cobden-street, Peterborough.

Blackburn.—Extensions at yard of Messrs. Ham Beadmore & Co., shipbuilders.

Blackburn.—Extensions to mill (200); Messrs. T. E. Smith & Son, architects, Central-chambers, Faldreth, Bolton.

Blackburn.—Picture palace; Mr. G. Chandler, architect, Maidstone; Messrs. W. E. Chivers & Co., builders, 28, Sheep-street, Devizes.

Blackburn.—Additions at workhouse; Mr. W. Henshaw, architect, Branch-road, York. Fire-station, Lancashire and Yorkshire Railway Company, Goods-yard; see also our list of Competitions, Contracts, on another page.

Mr. H. Dearden, Surveyor, Town Hall, Dewsbury.

Droghda.—One thousand houses for the Alderdale Estate Company, Ltd., Droghda.

Droghda.—Tar macadam plant buildings (550); Mr. William Nesher, builder, New-road, Cinderbank, Northampton.

Droghda.—Church (5,000); Messrs. Hyde & Son, architects, Erriswell-road, Worthing.

Easington.—One hundred houses for the Easington Coal Company, Ltd., 25, John-street, Sunderland.

Easington.—The following plans have been passed: Garage, etc., Bolton-road, for Mr. Henry Colegate; Mr. E. G. Cooke, architect; Messrs. M. Martin & Sons, builders.

Easington.—The following plans have been passed: "De Stuteville," Meads road, for Mr. B. Stevens, builder; "Faircourt," South-uphill, builder, Three houses, Whitley-road, for Mr. W. R. Albury; Mr. W. R. Box, architect; Mr. A. Ayard, builder. Addition to "Ranby," Milnthorpe-road, for Mr. M. M. Matheron; Mr. F. G. Cooke, architect. Six houses, Ringwood-road, for Mr. J. T. Miller; Messrs. Miller & Selmes, builders.

Eccles.—A plan has been passed for a Vicarage, Cromwell-road, Patricroft, for the Rev. R. Pratt.

Edinburgh.—Public baths, Leslie Green; Mr. C. C. Doig, architect, 149, High-street, Edin. Edin.—Children's home, Paterfield and Crewe roads (8,500); Mr. R. M. Cameron, architect, 55, King-street, Edin.

Edinburgh.—Picture house, Dalry-road (3,000); Mr. A. T. Goodwin, architect, 42, Queen-street, Edinburgh. Extension to George Mills for Messrs. J. & G. Cox, Ltd., glue manufacturers (2,500); Messrs. George Beattie & Sons, architects, 136, George-street, Edinburgh.

Edinburgh.—Business premises (2,000); Mr. A. J. Carter, Exeter-road, Exmouth. Warehouse for Messrs. Merrick & Co., paint manufacturers, 45-6, Preston-street; Messrs. W. J. & A. J. Pinn, architects, Bedford-circus, Exeter. New Capital and Counties Bank; Mr. S. Dobell, architect, Queen-street, Exeter.

Exmouth.—Public hall; Mr. G. Beavis, architect, National Provincial Bank-chambers, Exmouth.

Fairfield.—School, Oakwood-avenue; Messrs. Wright & Hamlyn, architects, Warrington.

Fence Houses.—School (4,500); Mr. W. R. Stafford, builder, Sunderland.

Fishpools (Bristol).—Memorial hall (2,000); Mr. J. Maynard Froud, architect, 1, St. Stephen's-chambers, Baldwin-street, Bristol.

Fitzwilliam.—Twenty-seven houses for the Hemsworth Colliery Company.

Fleetwood.—Twelve houses, etc., Walmsley-street; Messrs. J. W. Mason & Son, 72, Milton-street, Fleetwood.

Fleetwood.—Alterations and additions to premises for the Bromley and Crays Co-operative Society.

Fort William.—Reconstruction of buildings at Ben Bevis Distillery; Mr. J. G. Falconer, architect, Fort William.

Garsington.—Bed-room and Council offices (2,200); Messrs. J. Collinson & Sons, architects, Garsington.

Gillingham.—General Post Office; Mr. W. Ransom, architect, Newlyn, Bitterne Park, Southampton.

Glasgow.—Extensions to foundry of Messrs. James Howden & Co., boiler manufacturers (12,000); Messrs. Bryden & Robertson, architects, 147, Bath-street, Glasgow. Picture house, Sauchiehall-street (4,500); Messrs. Naylor & Sale, architects, Smith's Bank-chambers, Market-place, Derby.

Gomersal.—Parish church (1,200); the Vicar, Gomersal.

Greenock.—Large shed, Albert-harbour, for Messrs. Caird & Co., shipbuilders, Arthur-street, Greenock.

Hadlow Down.—Rebuilding parish church; Messrs. Miller & Selmes, builders, 75, Tideswell-road, Eastbourne.

Hamilton (N.B.).—School; Hope-street (15,000); Mr. Gavin Paterson, architect, 6, Cadzow-road, Hamilton. Picture palace (2,000); Mr. George Kay, 78, Quarry-street, Hamilton.

Hauxton (Cambridge).—School (4,000); Mr. H. H. Dunn, architect, St. Peter's Church-yard, Silver-street, Lincoln.

Holywell.—School (4,222); Messrs. Sibson Brothers, builders, Brynford-street, Holywell.

Hull.—Alms-houses (25,000); Mr. H. T. Hare, 13, Hart-street, E.C. School (25,000); Mr. J. H. Hirst, architect, Town Hall, Hull.

Ipswich.—Works (about 200,000) of Hadleigh-road, for the Diesel Engine Company, Ltd.

Keighley.—Buildings for the West Yorkshire Bank, Ltd., Princess-street, Halifax.

Kilmacool.—Additions to Mansion House, Auchenbothie Mains (2,500); Mr. Charles R.

Mackintosh, architect, 257, West George-street, Glasgow.

Kinlochleven.—School (250 places); Mr. K. McRae, architect, Oban.

Lairdsland.—Extensions to school (2,000); Kirkintilloch School Board.

Limerick.—Chapel (4,000); Mr. B. E. F. Sherry, architect, 57, George-street, Limerick.

Littlebrough.—Extensions to Sladen Mill for Messrs. Charles Kershaw, Ltd.

Luton.—Proposed school, Tennyson-road (450 places); Mr. W. Hoyle, Town Hall, Luton.

Lynton.—Drill hall; Messrs. Ellis, Son, & Bowden, architects, Bedford-circus, Exeter.

Margate.—Central fire station (7,000); Mr. E. A. Borg, engineer, Grosvenor-place, Margate.

Masham (North Riding, Yorks).—Hall (5,000); Mr. J. Houfe, architect, Albert-street, Harrogate.

Middlesbrough.—Bank and picture hall; Mr. James Forbes, architect, 43, Albert-road, Middlesbrough.

Monaghan.—Fifty-three houses (9,275); Surveyor, Rural District Council Offices, Monaghan.

Mossend.—Picture theatre, Pollock-street (2,000); Messrs. A. V. Wilson & Co., architects, 11, Merry-street, Motherwell.

Newton Abbot.—Alterations and additions to buildings, Queen-street, for Koonkey, Lt. Territorial headquarters for 5th Devon Regiment; Messrs. Ellis, Son, & Bowden, architects, Bedford-circus, Exeter.

Newbigging.—Institute (2,000); Mr. C. F. Murphy, architect, Newgate-street, Morpeth.

Newport (Mon).—Extensions to National Provincial Bank; Mr. Henry J. Griggs, architect, Metropolitan Bank-chambers, Commercial-street, Newport.

Northampton.—The following plans have been passed: Four new roads, Wantage Estate No. 2, for the Northampton Town and County Benefit Building Society; new cattle Market Tavern, Cattle Market-road, for Messrs. P. Phipps & Co., Ltd.; three houses, Sandringham-road, for Mr. A. Glenn. Plans have been lodged as follows: Warehouse, Castle-street, for Messrs. Jellman & Sons; cinematograph hall, Kettering-road, for Mr. C. Robinson.

Northfleet.—Factory for the Thames Metal Company.

Paisley.—Baptist church hall (1,850); Messrs. Cray, Barr, & Cook, architects, 15, St. James' place, Paisley.

Portrie (N.B.).—Buildings at St. Kilda Lodge (2,000); Mr. R. J. McBeth, architect, Queen House, Inverness.

Radcliffe.—Electricity sub-station (953); Messrs. W. Rigby, Ltd., builders, Darbyshire-street, Radcliffe.

Rugby.—Girls' home, Lawford-road; Mr. J. W. Pendred, Clerk, Guardians' Offices, Rugby.

Salford.—A plan has been passed for alterations and additions to the Empress Electric Theatre, Church-street, Pendleton, for the Proprietors.

Scurf.—Fever hospital (3,000); Mr. T. W. Rosingrave, architect, 33, Catherine-street, Limerick.

Shirley, Yorks.—Engineering works, Hirst-lane, for the Scott Engineering Company, Manningham-lane, Bradford; Messrs. Thomas Barker & Sons, architects, Midland Bank-chambers, Bradford. Picture theatre; Mr. H. Booth, architect, 42, Regent-street, Haslingden.

Shirley (Southampton).—Proposed fire-station (1,000); Mr. J. A. Crowther, Engineer, Town Hall, Southampton.

Skene.—Extension to school (2,150); Messrs. Jenkins & Marr, architects, 16, Bridge-street, Aberdeen.

Smethwick.—School, Devonshire-road; Mr. A. H. Sears, Town Hall, Smethwick.

Southampton.—Plans have been passed as follows: Six houses, St. James' Park-road, for Messrs. P. & A. Richards; alterations and additions, etc., Blightmore Lodge, Millbrook-road, for Messrs. Weston & Burnett; eight houses, Portwood-road, for Mr. F. W. Young, jun.; four houses, Oak Tree-road, for Mr. W. H. Masters. A plan has been lodged for alterations and additions at Crown Hotel, High-street, Shirley, for Mr. C. H. Brightbill.

St. Neots.—Rebuilding paper mills; Resident Engineer, St. Neots Paper Mill Company, Ltd., St. Neots.

Sunderland.—Primitive Methodist church; Mr. C. W. Phillipson, architect, Murton-chambers, Grainger-street, Newcastle-on-Tyne; Mr. R. Morris, builder, Felling-on-Tyne.

Thedwastre.—Housing scheme; Mr. Ainsworth Hunt, architect, Bury St. Edmunds.

Troon.—Church, Banting-drive (1,200), for the Rev. J. V. Hammond, Rector of Holy Trinity Church, Ayr.

Twickenham.—A plan has been passed for five houses, Hartington-road, for Messrs. Brewer, Smith, & Brewer.

Whaplode.—Eight houses (1,544); Messrs. Wilkinson & Co., builders, Wisbech.

"Penrose," Beaconsfield, Bucks.

Messrs. Johnson & Boddy, Architects.

HOUSE AT BEACONSFIELD, BUCKS.

THIS house, built for Dr. E. Clarke-Cohen, stands on a fine site on the main road from Beaconsfield to Penn.

The instructions given to the architects by the client were that they should plan a house with reception-rooms of given dimensions and that the roof should on no account cut into any of the bedrooms.

Externally the house is built of hollow walls to the first floor, faced with dark-red local bricks. Above the first floor level the work is built solid and covered with smooth cement. The roofs are boarded and covered with Broseley tiles. The dining-room is finished with beamed ceiling, etc. The whole of the woodwork in this room is of American whitewood and is stained and finished mahogany. The doors of reception-rooms are oak Gilmour doors. The floors of reception-rooms and hall are pitch-plie wood blocks, all stained and polished.

The house is fitted up with radiators heated with hot water from a boiler in the basement under consulting-rooms.

The radiators and boiler were from Messrs. Messengers; the steel casements from Messrs. Humphries, Jackson, & Ambler, Ltd.; the mantels and stoves from the Standard Range Company; the kitchen and sanitary fittings from Messrs. Froy & Son, Ltd.; and the water-softening apparatus from Messrs. Maignens.

The builder was Mr. Frank Froude, of Beaconsfield, and the work was carried out from the designs and under the superintendence of Messrs. Johnson & Boddy, architects, of Southampton-street, Strand, W.C., and Beaconsfield and Gerrard's Cross, Bucks.

THE INSTITUTION OF MUNICIPAL ENGINEERS: STRUCTURES OF THE FUTURE IN RELATION TO AVIATION.

A MEETING of this Institution was held on the 12th ult., at the London Aerodrome, Hendon, N.W., when the following papers were presented for discussion: "The Structures of the Future in Relation to Aviation," by Mr. Horace Cubitt, A.R.I.B.A., P.A.S.I., and "Some Suggestions for By-laws and Regulations in Relation to Aviation," by Mr. B. Wyand, Secretary of the Institution.

In the course of his paper Mr. Cubitt said "the buildings—workshops and aeroplane-sheds—as at present constructed, seemed to be of a somewhat temporary character, the enclosures being of wood studding covered either with boarding or corrugated iron, and the roofs

being light corrugated iron structures. This is only natural. In the early stages of any industry it is bad policy to erect buildings of too permanent a character, as it is very probable that a short experience will show that considerable alterations in planning and arrangement are required. But in course of time, when the twin industries of aeroplane construction and aerial transit are established as large factors in our national industrial programme, buildings of this slight construction will not suffice.

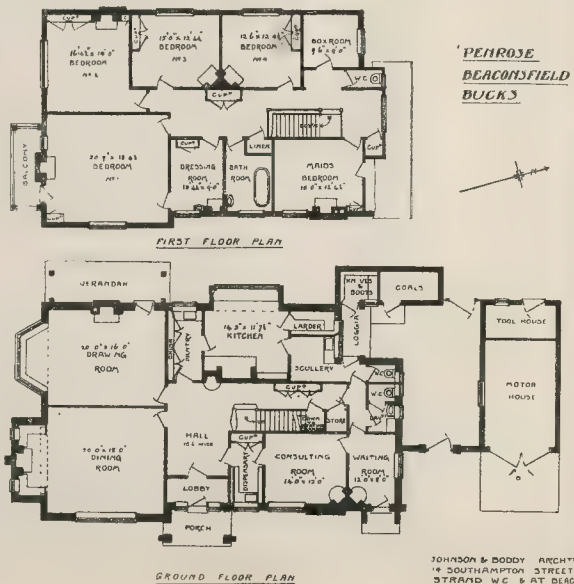

Forms of Construction.

When consideration is given to the form which this permanent construction will take, it is, however, a question whether plain brickwork will hold its own, or whether it will have to give place to one of the more modern forms of construction. As regards the aviation workshops, these, in common with new workshops of other kinds, may very probably be constructed of a steel skeleton filled in with

brickwork, or of that new combination materials, reinforced concrete. Aeroplane sheds, necessarily being, it is presumed, one-story buildings of moderate height, will hardly lend themselves to steel-frame construction, but it would appear that reinforced concrete is particularly suitable for structures of this character. Experience in connexion with new General Post Office, and elsewhere, has shown that reinforced concrete is particularly suitable for buildings requiring large areas of unencumbered floor space. Therefore it may be assumed that it will in due course be largely adopted for the construction of aeroplane sheds, particularly if it is possible, as I believe now to be the case, to form watertight roofs of this material without asphalt or any other kind of covering.

One special constructional point in the design of aeroplane-sheds, whether buildings of present size or those of the much greater proportions which we may expect to see in the future, appears to be the doors or shutters to close the necessarily large main openings. At the London Aerodrome the construction of the various aeroplane-sheds will be found to have exercised considerable ingenuity in the design of the wooden doors. It is evident that if the ordinary practice of making folding doors to the main opening of a structure were adopted in the case of an aeroplane-shed such doors would, on account of the great size of the opening, be most unwieldy, and the task of manipulating them in a gale of wind would be positively dangerous. Hence the need for doors or shutters which can be folded into several sections. While such a contrivance as that of having wooden shutters with vertical pivots sliding in the grooved iron bars at top and bottom of the opening may be efficient enough to warrant its occasional adoption in permanent buildings, it seems probable that in the best class of work, steel rolling shutters similar to those adopted in tramcar-sheds, should be employed. Such shutters need not be large widths, and would thus cause no difficulty in operation, while the advantage of having shutters entirely out of the way when not in use is very evident.

A further important constructional point which does not occur in modern aeroplane sheds, but may be anticipated in future structures, is the obtaining of large floor spaces with the absolute minimum of columns or stanchions. At present the aeroplanes in use are comparatively small—that is, compared with those we may expect in the future—it is not, I believe, customary to put a number of aeroplanes in one shed. But, in due course, when an enterprise with such a title as the London Aerobus Company is in full swing each building at the company's depôts

AND GERRARD'S CROSS, BUCKS

ableness be constructed to contain a considerable number of aerobuses, and with these vehicles needing by many times the size of a modern plane it will be necessary to keep the floor area almost entirely free from columns. To set this with due regard to economy will not be easy, but probably by a skilful use of reinforced concrete the problem will be satisfactorily solved.

Thus far the structures considered have been ones for important aeroplane enterprises. It is with the development of the science of flying, it is to be anticipated that before very long adventurous spirits will be seized with the idea of discarding their motor-cars for aeroplanes, and an aeroplane-shed will be a necessary complement to the outbuildings of a well-equipped house. The only special question which appears to arise in connexion with such building is the provision of a sufficient space starting in front of the shed, it being an extremely difficult matter to "take wind" in the middle of a street of ordinary width, could such be allowed, as it probably will not be by the responsible authority.

Town Landing Stages.

The subject of the structures to be erected workshops for the manufacture of and as aids for the housing of aeroplanes makes great demands on the imagination. Structures of this kind already exist as a guide, and in any case the uses to which the buildings are to be put are not such as to necessitate striking departures in construction. When landing stages to be erected in large towns are considered a more difficult case for speculation occurs. That such landing stages will be necessary is almost self-evident. As soon as the risk associated with aeroplane flights has been reduced to a reasonable minimum, the present prohibition of flying over towns will be removed, or at any rate modified so as to be made applicable only to the central portions. Town arrival and departure stations will have to be formed in populous districts where land is of considerable value, it will be a financial impossibility to provide open spaces of ground level of sufficient area to enable aeroplanes to descend and ascend without incurring the risk of coming into contact with adjoining buildings. Hence the necessity of landing stages a little above the level of buildings.

When I came to give a little direct attention to the subject of the design and construction of these landing stages for aeroplanes I found in self-analysis that such impressions as I have possessed had been formed by the perusal of a few works of authors of "futurist" tendencies, who, in writing of the wonders of coming century, had given free rein to their imagination, regardless of the result—so long as it was sufficiently extraordinary. Landing stages, as thus described, were to be gigantic structures with logs, like small Eiffel towers, dominating the country for miles around, making our ordinary buildings look like pigmies beside them. There is no reason, however, to think that we are coming to this. In the first place, we are not likely to get the steel structures, standing in the midst of ordinary buildings. Local authorities would hardly allow them because of the risk to adjoining buildings by their collapse in the event of fire. Also we are not in ordinary cases, thinking, going to have stages consisting merely of logs and a platform like a derrick. If, as is so certain, tall landing stages are to be erected in districts where land is very valuable, will obviously be desirable to utilise the space below the landing stage—i.e., to erect many buildings upon it. But if the site is reserved, and the buildings and the landing stage to be erected at the same time, the question at once arises, Why not form them as one structure? If this is done, it will be obviously a waste of space to provide separate legs for landing stage, as such stage can be easily supported on the walls or other enclosures of the building. Thus, possibly as it may seem, an aeroplane landing stage of the future will probably be nothing more than a large lofty building with a flat roof, on which from which the aeroplanes will alight and start. Lifts will, of course, be provided from the landing-stage to the street level, necessary waiting-rooms, etc., in connexion with the aviation service will be placed on the top story, and the lower stories let as offices or for trade purposes.

It may be asked, how big are such aviation

buildings likely to be? With aeroplanes of present-day size probably a landing stage 80 ft. to 90 ft. in width and about 200 ft. long would suffice to provide both departure and arrival platforms side by side. But with the machines increased very considerably in size so as to be able to carry a fair number of passengers, it would seem that an area of at least 200 ft. by 200 ft.—nearly that of the Selfridge building, Oxford-street—would be required. Then there is the question of height. The ordinary limit of height for London buildings is 80 ft. to the top of the parapet plus two stories in the roof, which results in a height of, roughly, 100 ft. from the street level to the ridge of the roof. Having regard to the desirability of being above all roof eddies, it would seem that the landing stage level should be about 120 ft. or 130 ft. above the street. This may appear an excessive height in a position where the surrounding buildings are comparatively low, but except in a case where the immediately adjacent ground and buildings are in the ownership, or by some means are under the control, of the body erecting the landing stage, it will be a questionable policy to erect a stage of less than this height. For, if such is done, there will always be the risk of its utility being jeopardised by the erection of new buildings, or the reconstruction of existing ones, to the legal limit of height.

As regards the form of construction to be adopted, neither brickwork nor stonework are suitable, if economy is a consideration. Both steel and reinforced concrete possess great advantages over the older forms of construction in the case of the erection of lofty buildings. As to which of these two forms of construction—a properly encased steel frame or a scientifically-designed arrangement of steel and concrete—is likely to be adopted it is hard to say. Probably both forms will find their supporters. A great deal has lately been written in praise of reinforced concrete, but the advantages of a steel frame for a lofty structure must not on this account be overlooked.

Although it would doubtless be desirable for all aeroplane landing stages to be erected and controlled by municipal bodies, it is not unlikely that in many districts recourse will be had to private enterprise. The persons responsible for the erection of the first landing stages will naturally be men with ideas a little in advance of those of the general public, and leading members of municipal bodies are hardly able to move in advance of public opinion. The need for private enterprise, therefore, arises. Possibly in due course some of the existing transport companies may think it worth while to run aeroplane services in connexion with their other enterprises, in which case they would presumably themselves erect landing stages. Or enterprising individuals in control of other commercial concerns may, with an eye to advertisement and increased business, take the initiative by erecting a landing stage in connexion with their premises, recouping themselves for part of their expense by the receipts obtained from the landing dues. The number of landing stages to be erected in any locality will be within the discretion of the local authority, as the consent of such body will require to be obtained to the erection of the stages if such exceed, as apparently they must do, the legal limit of height of ordinary buildings.

Situation of Aviation Structures.

A treatment of the aviation structures of the future is hardly complete without some reference to the situations in which they are likely to be erected. Having regard to the great distances that aeroplanes are able to cover in a few minutes, it seems reasonable to suppose that the sheds for the storage of the machines will be erected in the extreme outer suburbs of our towns, where land can be purchased at very little above agricultural value. The workshops will doubtless adjoin the sheds, but, of course, there will need to be a workshop or two in the heart of a town, so that urgent repairs can be dealt with without delay. The landing stages in towns of ordinary size will doubtless be erected in the centre of the inner commercial districts. It will then be possible for business men to come direct to their offices from country districts some twenty-five or thirty miles out in the short space of half an hour. In very large cities, in London especially, it is questionable whether the responsible authorities will not do well, for reasons of public safety and convenience, to reserve a

small area in the extreme centre of the commercial districts within which flying is prohibited, the landing stages in such cases being erected at intervals along the boundary line enclosing such area. There is a good deal to be said for such a restriction.

As an illustration of what is likely to take place when—it may be twenty years, it will certainly not be fifty years—aeroplane transit is established as one of the ordinary forms of locomotion let London be considered. As regards the housing of the aeroplanes, the necessary buildings will probably be erected, for the most part, well outside the present county area. The land on the south of the Thames beyond Woolwich will probably be found to be especially suitable for the erection of aeroplane sheds and workshops, as it is cheap, and materials, machinery, etc., may be conveyed to it by water. The question of the situation of the landing stages in the inner districts of London is a very attractive one for speculative thought. If flying is to be allowed without restriction over the whole of London, the obvious position for the principal landing stages will be along the Oxford-street and Holborn route, from the Marble Arch to the Bank and on to Aldgate, this being the backbone of business London. The Strand route, from Piccadilly-circus to the Bank, being next in importance, would, of course, be similarly served. But it is very questionable whether the erection of landing stages in the very centre of London should be allowed. The thought of fleets of aeroplanes converging on a landing stage at the Bank hardly suggests security. The tangle of traffic at the ground level at this point is sufficiently bad without the introduction of a further tangle in the air, with aerial police on point duty overlooking the City police below. The reservation of a comparatively small area in the centre of London for ordinary surface and underground transit would tend to prevent any congestion of aeroplane traffic, with its obvious great dangers and probable injurious effect on the subjacent locality. Such an area might be bounded on the north by the Marylebone, Euston, and Pentonville roads, on the west by a line following the ordinary omnibus route from Chapel-street via the Marble Arch and Hyde Park Corner to Victoria, and extended to Vauxhall Bridge. On the south the river would appear to constitute the natural boundary, and on the east a line could be arranged to extend from the City boundary adjoining the river, through Aldgate to the Angel, Islington. It will be seen that even with our present means of locomotion any part of central London can be reached in less than ten minutes from some point on this suggested boundary line. The extra time in transit which such a restriction would involve is therefore comparatively trifling, and the little inconvenience would be very greatly outweighed by the advantage of having this clear area reserved in the centre of the metropolis.

Experts are prone to differ, and on this question of the important aviation structures of the future every one who has a knowledge of the construction of buildings is as much of an expert as any one of his fellows. For we are all on a level as being, at present, pure theorists on this subject. It is therefore by no means anticipated that the views here put forward will meet with general acceptance, but that useful and interesting divergences of opinion will arise in the discussion. Although the problem is one which the allied professions of engineering and architecture will be required to solve, yet very great interest will be taken in what the aviators themselves have to say. For on this subject they may be expected, if not to pay the piper, to have at least some voice in setting the tune."

BEDFORD COLLEGE, REGENT'S PARK.

We have been informed by Messrs. Thomas Lawrence & Sons, of Bracknell, that the whole of the rubber bricks and the best hand-made and hand-pressed sand-faced facings used in this building, illustrated last week, are of their well-known T.L.B. make.

GENTRY, STAMFORD-STREET.

In referring in our last week's issue (p. 767) to the gentry in Stamford-street, erected in connexion with the new building for H.M. Stationery Office, it should have been stated that the structure was the work of Messrs. Drew, Bear, Perks, & Co., Ltd., of the Battersea Steel Works, S.W., and not of the firm mentioned.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Chelysmore, Chairman, presiding.

Plans.—The Finance Committee recommended and it was agreed to make loans to Borough Councils as follows:—Deptford, 3,778*l.* for paving works; Hackney, 3,468*l.* for electricity mains; and Poplar, 20,000*l.* for electricity undertaking.

New Sessions House.—A report was brought up by the Local Government Committee recommending that the existing court house at Newington be demolished and a new court house erected on the site and on adjacent land belonging to the Council; also that during the erection of the new court house the quarter sessions be held at Clerkenwell Sessions, which should be disposed of as soon as the new building at Newington had been erected. The estimated cost of the new court house is 100,000*l.* The Committee's recommendation was adopted.

Theatres, etc.—The Theatres and Music Halls Committee stated that they had received an application for a certificate accompanied by a drawing submitted by Messrs. Lovegrove & Papworth, for a cinematograph hall proposed to be erected at 100 and 102, High-street, Wandsworth. Drawings have also been submitted by Messrs. W. Woodward & Sons and Mr. G. W. Booth for a proposed erection of a cinematograph hall on a site in Regent-street, now partly occupied by the New Gallery Restaurant.

METROPOLITAN ASYLUMS BOARD.

At the fortnightly sitting of the above Board, on Saturday, the following matters were dealt with:—

Long Reach Hospital.—The Local Government Board had forwarded an order authorising the managers to carry out adaptation and fire-resisting works at the above hospital at a cost not exceeding 1,500*l.*

Fountain Temporary Asylum.—It was decided to forward to the Local Government Board for their approval, a plan for the adaptation of a portion of Block F at this Asylum for the purposes of a visitors' room and recreation hall for patients, and of the remaining portion of the same block for an isolation ward.

Tenders.—The following tenders were accepted:—Alterations to the Medical Superintendent's house at the Northern Hospital; Mr. W. S. Sharpin, Wellington Works, Bow, 473*l.* Painting, repairs, etc., at the Down's School; Mr. W. Hussey, 32, Albert Hall-mansions, S.W., 945*l.* For engineers', ironmongery, and general stores, the tender of Messrs. Pryke & Palmer was accepted for 218 items; that of Messrs. E. Bird & Co. for twenty-eight items; and that of Messrs. H. & C. Davis & Co. for twenty-one items.

Joyce Green Hospital.—Approval was given to the laying of granite tracks in Green-lane, Joyce Green Hospital, at an estimated cost of 510*l.*, and to the widening of other granite setts, at a cost of 400*l.*

LEGAL COLUMN.

London Building Act Problems.

A case before the Police Magistrate at Greenwich was recently very shortly reported in the *Times*, in which a summons was taken out against a defendant for failing to give the District Surveyor for Deptford a notice under the London Building Act. The case is so briefly reported that it is somewhat difficult to gather the facts, as it is not stated in what capacity the defendant was acting. It appears, however, that the work which was being carried out was in connexion with the construction of a sewer, and that over this work it was admitted that the District Surveyor had no jurisdiction under the London Building Act, but that the summons was taken out because there was an excavation under or near the buildings—three houses in Malpas-road, Brockley—which it was the duty of the District Surveyor to see filled in to his satisfaction. The magistrate convicted, but consented to state a case, so more information may be forthcoming as to the facts of the case; but it may be useful to our readers if we indicate the provisions in the Building Act which apply in such cases. By sect. 164 the

London County Council may make by-laws, and one of the matters which is specified to be dealt with by by-law is:—"The mode in which, and the materials with which, any excavation made within a line drawn outside the external walls of a house, building, or other erection, and at a uniform distance therefrom of 3 ft., shall be filled up."

The by-law provides that "it shall be the duty of each District Surveyor, on receiving notice of the commencement of any house, building, or other erection, or on his becoming aware that any house, building, or other erection is being proceeded with, or that any excavation is being made within a line drawn outside the site of any house, building, or other erection, and within 3 ft. therefrom, to see that any excavation be filled up with the material and in the manner specified by the foregoing by-laws." In the wording of the by-law it is to be observed that it contemplates the Surveyor "receiving notice" of the "commencement of any house, building, or other erection," but of his "becoming aware" of any excavation. Other by-laws in the same group only speak of notice being given and plans being deposited in connexion with the commencement, erection, re-erection, alteration, or addition of or to structures. Sect. 145 of the Act provides for notice being given by the builder to the District Surveyor "where a building, structure, or work" is about to be begun. There have been a great many decisions upon the meaning of the word "work" in this section, but we are not aware of any decision applying it to excavations with a sewer.

Therefore, although it would be an offence to fill in an excavation contrary to the by-laws, i.e., otherwise than with the natural soil or with brick or dry rubbish, "or with other suitable material to be approved by the District Surveyor," it is not clear that it is an offence not to give the District Surveyor notice, especially where the excavation is merely being filled in with the natural soil, and presumably where a Borough Council is laying a sewer, the question of excavations would have been brought to the notice of the District Surveyor, or he would have become aware of their necessity. The case, if it goes further, will be watched with interest.

Negligence of Sub-Contractor's Workmen.

In our "Law Reports," June 23, we published two cases in which builders or contractors were compelled to appeal from judgments by which they had been held liable to pay damages to what is termed in law a "stranger"—i.e., members of the public in no way connected with the operations being carried on—for personal injuries sustained through the negligence of some person not in the employ of the defendants.

In the first case, *Cadbury v. Holliday & Greenwood*, a workman in the employ of a sub-contractor, who was putting metallic casements under contract in a building which the defendants were erecting, placed a tool on a window-sill, which, becoming displaced, struck a passer-by. In a trial in the High Court the jury awarded 500*l.* against the defendants. The Court of Appeal set this judgment aside, holding this to be an act of collateral negligence on the part of the sub-contractor's workman. In a trial in the County Court the defendants, nor was the duty he was performing of such a nature as to call for special precautions being taken by the contractors, the defendants.

A case practically on all fours with the above was decided some forty years ago, *Briggs v. North London Railway Company*, by Lord Coleridge and Lords Justices Bramwell and Brett, where it was held that there was no evidence that the falling of a tool was a probable accident which might reasonably be foreseen so as to make it the contractor's duty to guard against it.

In the second case, *Wilkinson v. Shorrocks*, the contractor's men on a Saturday had left the works, where they were constructing a building, properly closed. A cartman delivered some bricks after the contractor's men had gone, but whilst sub-contractor's men were still at work on the premises. He removed a contractor's gate, and left it in such a position that a child trespassing on the premises was injured by it. The County Court Judge held the contractor liable, but a Divisional Court set the judgment aside, on the ground that there was no evidence of negligence in any one for whom the contractors were responsible.

In these days, where large sections of work are put out to be done under sub-contracts, the contractor is constantly being sued for acts of negligence on the part of the sub-contractor's men, and difficult questions of law arise, especially as between the two sets of employers using common plant; but as regards strangers, the above cases support the statement of law in *Rosecoe's "Nisi Prius Evidence,"* that "Where a contractor employed

to do a lawful act which would not in a natural course of things be likely to do injury to others, does it negligently, the tractor alone and not the employer is liable. This may be amplified by saying that a tractor is liable to the employer for negligence acts on the part of the sub-contractor's men, unless he exercises control over them unless the work undertaken by the contractor necessitates special precautions being taken by him in connexion with the operation to be done under the contract by the contractor.

LAW REPORTS.

Case under the London Building Act, 1894. Failure to Serve Notice on the District Surveyor.

At Greenwich Police-court, on June 27, Arthur L. Etheridge, builder, appeared before Mr. Symmons to answer three summonses having failed to serve building notices on the District Surveyor for Deptford in respect of work executed by him for the Borough Council of Deptford in connexion with the reconstruction of a sewer. Mr. L. N. S. Pearn appeared for the District Surveyor, Mr. Greig and Mr. J. Dudley Wolverson appeared for the defendant in respect of the Borough Council. Three summonses were issued in respect of three several buildings Nos. 81, 83, and 89, Malpas-road, and were taken together.

Evidence was given by the District Surveyor that on May 25, 1912, he discovered work in progress at No. 81, Malpas-road, Deptford, which no notice had been served upon him. The work consisted of cutting an open trench through the basement floor of the main building and removing a portion of the foundations of the walls. The trench was then continued through the open air and under the back addition of the building, where concrete had also been removed from the foundations. The trench was carried across the back garden and at a depth of about 3 ft. 3 in. it passed under one of the rear water-closet blocks. This work was discovered on June 3, 1912, and same day the District Surveyor telephoned the defendant, calling his attention to the necessity of restoring a solid support to the water-closet block. The defendant said would attend to this point; but next June 4, the District Surveyor found that portion had been improperly filled in, and the defendant requiring him to provide a support of concrete. The work was amended to satisfaction of the District Surveyor as required by the notice. On June 4 the District Surveyor discovered that the trench had been continued under the rear water-closet block of No. 89, Malpas-road, from side to side, the solid support under portions of two of the walls had been removed. He stated the duty of dealing with these points imposed on him by sect. 146 of the London Building Act, 1894, and the work involved the application of the preliminary paragraph of the First Schedule, particularly paragraph 1, which provides that the footings of walls of buildings shall rest on the ground, or upon concrete, or upon other substructure. The by-laws under the London County Council (General Powers) Act, 1895, also were involved, as By-law 2 provided the mode in which and the materials with which any excavation outside the site of a building shall be filled up, and also the by-laws under the Metropolitan Management and Building Acts (Amendment) Act, 1878, as By-law provides that the site of every house or building shall be covered with a layer of concrete at least 6 in. thick. These by-laws further impose the duty on the District Surveyor of securing compliance therewith. Letters had been addressed to the defendant calling his attention to the necessity of serving notices on the District Surveyor in respect of the several works.

For the defence it was argued that the work was executed by the Borough Council under the duties imposed by sect. 69 of the Metropolitan Local Management Act, 1855, and was not subject to control by any authority, and Mr. Wolverson instanced the practice of the London County Council dealing with dangerous structures, although the Borough Council was the authority charged with the duty of licensing hoardings, the London County Council discharging the duty of licensing hoardings, and take out licences for such hoardings as erected by them in connexion with dangerous structures. In reply to this point it was stated by the magistrate that there is a section in the Metropolitan Local Management Act, 1855, which empowers the Commissioners of Police to take out licences for such hoardings, and the operation of such Act, which included licensing of hoardings, and at that dangerous structures were dealt with by

commissioners, but now these powers are exercised by the London County Council.

Mr. Pease pointed out that every building, structure, or work in the Metropolitan area is subject to the London Building Act, 1894, except those which are specially exempted either partly or wholly under sects. 201 to 205, and sect. 205 more particularly refers to works done by a local authority. He further called his Worship's attention to the fact that the London County Council had never claimed any exemption outside those expressly granted by the Act.

The magistrate referred to the statutory duty imposed upon the District Surveyor of securing the proper construction of buildings and their maintenance, and in indicating that the London County Council was a higher and more important body than the Borough Councils specially mentioned the school cases where objections between the District Surveyors and the London County Council have been tried, and it had been held that the London County Council must serve notice of their works on the District Surveyor. As regards the sewer works, all materials provided, in respect of the actual sewer, but there was clearly work by the District Surveyor to do in connexion with the foundations of the buildings. He pointed out that the District Surveyor on each summons, a fine of 10s. and 11s. costs as imposed on each of the three cases.

OFFICIAL REFEREE'S COURT.

(Before Mr. H. W. VEREY.)

Alterations to a House: Thompson v. Thompson.

MR. VEREY, on the twelfth day of hearing, gave judgment on July 2 in a case in which Messrs. John Thompson & Co., builders and contractors, carrying on business at 43, Woodstreet, Peterborough, claimed the balance of an account from the defendant, Mr. George Thompson, of Sutton Marsh, Long Sutton, amounting to 1,741l. 4s., for work and labour done, and materials provided, in respect of alterations and additions at Wyde Farm house, Thorney, near Peterborough, and on the borders of Lincolnshire. The defence in its action was that the charges were excessive and unreasonable. The defendant had paid 400l. for the sake of peace.

The house was acquired by the defendant—who is not related to the plaintiffs—as an intended residence for his daughter, who was married in the spring of 1911 to Mr. Harry Selwyn Thompson, who, according to the Council, is the land agent to the Earl of Leicester. In March the plaintiffs were approached by Mr. Dixon-Spain concerning the work. He told them that the wedding was fixed for May 1, 1911, and that plaintiffs could not lock into the house until April 5, because it was still in the occupation of a previous tenant. Mr. Compston, Counsel for the plaintiffs, declared in his opening statement on March 14 it was agreed by Mr. Dixon-Spain that the work required to be done was such that there was no possibility of giving a very estimate for it. Therefore the contract was for the execution of certain work which could not be estimated for. They were employed to do the work. Mr. Dixon-Spain had decided whether the plaintiffs had a competent designer who could get out designs, prepare drawings and details, and always be on the spot to take instructions from him and advise him up to time. The plaintiffs replied that they had such a man, and that they would place his services entirely at the disposal of the defendant until the work was completed. The plaintiffs, said Mr. Compston, were to act as architects as well as contractors.

The house in question, built in 1862, had been a farmhouse, as its name implied—Wyde Farm House. Counsel remarked that it would be fairly obvious that the work was of such character that no complete specification could be made.

Evidence of an exhaustive character was given on both sides, the defendants, in addition to surveyors and builders, calling two architects, Sir Brumwell Thomas, F.R.I.B.A., and Mr. John Edwin Dixon-Spain, A.R.I.B.A., the latter being a brother of Mr. Dixon-Spain. A defence challenged, amongst other things, a number of hours worked, and contended that a clerk of the works ought to have been employed.

Mr. J. E. Dixon-Spain, who practises at Hanover-square, stated in evidence there were two methods of arriving at a fair conclusion as to a fair charge for the work. One was personally to inspect the premises and to form a mental estimate of what was considered to be a fair price. The other was to send a quantity surveyor to measure up and price the work. He was anxious that the matter should be settled, and, visiting Wyde, took the first view. Witness came to the conclusion that 1,400l. would be ample remuneration for the

work done. Plaintiffs would not agree to that figure, and witness sent Mr. Venning, a quantity surveyor, to measure up and price the work. Mr. Dixon-Spain added that he had much experience of the alteration of old houses, and he considered that the work at Wyde did not present any remarkable features.

In cross-examination by Mr. Compston, the witness said he did not consider it necessary for anybody to give him information about the hidden work. He had all the data he needed, and, even if he had had no information at all, it would have been easy for him to arrive as an architect at a fairly accurate estimate of what the work was.

Sir Brumwell Thomas, who practises at 37, Old Queen-street, Westminster, in answer to Mr. Herbert Smith, defendant's Counsel, stated that he had been asked to visit the house in question, and he had gone through the bill of quantities with Mr. Venning. Sir Brumwell supported in evidence the defendant's several contentions.

Mr. Smith: Plaintiffs' witnesses have said that if this had been a contract job they would admit there ought to have been a foreman, and that as this was a day-by-day job there was no necessity for one. What do you say?—Sir Brumwell replied that, in fairness to everyone, a foreman was just as necessary on a day-by-day job. He did not see why this work could not have been completed in five weeks. Asked the secret of getting such a job as this performed with due expedition, Sir Brumwell replied: "Control and organisation." Sir Brumwell would not subscribe to the plaintiffs' proposition that to do this job in five weeks would entail a tremendous drive. The majority of drawings in this case were setting-out details, which would be included in the ordinary work.

After hearing much other evidence and the speeches of Counsel on both sides,

The Official Referee, delivering his decision, said that the plaintiffs were a firm of high repute, and it had been admitted that this practically was a good class of work. He thought that there was absolutely nothing in the whole case or the evidence to lead him to think that the plaintiffs had acted with any intention to overcharge or to deceive, or that they had departed from their general business and ordinary book-keeping methods. The plaintiffs had put in their time-sheets and their material books, and they said that this time had been spent and materials used, and they were priced. The main objection raised by the defendant was that the time could not have been properly used. Two gentlemen, on behalf of the plaintiffs, who had visited the house had said in evidence that they had come to the conclusion that they could not measure the work. He (the Referee) had had the advantage of seeing the house and of having had things pointed out. The defendant, on the other hand, had called three witnesses at least who had measured and valued the work, and they had acted independently. Two architects, too, had been called, and had more or less supported the figures which quantity surveying and building witnesses had given for the defendant. Unless he thought that these men were saying what was not true, he could not see how he could disregard their evidence. He could not get over the fact that these gentlemen had all come to a figure very much alike—although independently of each other—for the work. Here were three people who had measured. Was he to disregard them? If the valuation came any way near what the builders' books and time-sheets showed, he should be in favour of accepting them as the proper value of what the defendant ought to pay. In his opinion, however, any mistake or omission which these gentlemen might have made was fully covered by the difference between the money paid into Court and the sum offered by defendant. Taking everything into consideration, he found as a fact that the sum of 1,400l. paid by the defendant was sufficient to satisfy plaintiffs' claim, and he, therefore, gave judgment for the defendant with costs, after deducting therefrom plaintiffs' costs up to the time of the payment into Court.

LONDON COUNCILS.

Bermondsey.—Plans have been passed as follows:—Mr. H. Kent, builder, 51, Beacon-road, Hither Green, S.E. factory, Tidal-Place, Riley-street, for Messrs. Grant & Co., Riley-street, S.E.; Messrs. J. Greenwood, Ltd., builders, 12-14, Arthur-street, E.C., warehouses, Weston-street, for Messrs. Malcolm, Inglis & Co., 62, St. Thomas-street, and Messrs. H. I. Pearson & Co., 72, St. Thomas-street; Messrs. J. Greenwood, Ltd., builders, 12-14, Arthur-street, E.C., buildings on the site of Nos. 184-192, Bermondsey-street.

Camberwell.—The work of paving a portion of the west side of Peckham Rye with granite setts is to be carried out by the Borough Engineer, and the London County Council are prepared to sanction a loan of 1,866l. for carrying out the work. Plans have been lodged with the London County Council by Messrs. Elliot & Porter for the erection of buildings on the east side of Red Post-hill.

Fulham.—The attention of the London County Council is to be called to the inadequacy of Wandsworth Bridge for the purpose of heavy vehicles, and suggesting the expediency of erecting a new bridge in lieu thereof suitable to the present requirements.

Hendon.—The Architect to the Guardians is to be instructed to prepare specifications with a view to tenders being invited for the execution of repair works at the schools.

Heston and Isleworth.—Applications are to be made to the Local Government Board for sanction (1) to borrow 5,783l. for the laying of "Durax" paving in the margins outside the tram track in a portion of London-road; and (2) 2,460l. for replacing the wood-paving in High-street, Hounslow. Plans have been passed as follows:—Messrs. Smee & Houchin, alterations to Baptist chapel, Staines-road, Hounslow; Messrs. P. Chase, Gardener, & Co., cinematograph theatre, Staines-road, Hounslow; Messrs. Fuller, Smith, & Turner, alterations to Castle Inn, London-road, Isleworth; the Rev. F. W. A. Wilkinson, alterations to the Vicarage, Heston.

Hornsey.—Plans prepared by Mr. G. E. T. Laurence for the erection of a temporary school at Muswell-hill have been approved. The school is planned to accommodate 220 children. Plans have also been approved for alterations at the North Harringay School.

Islington.—The tender of Messrs. D. R. Paterson, Ltd., is to be accepted by the Borough Council, at 278l., for extending the joint main road at the cemetery for a distance of 170 yds.

Kensington.—The tender of Mr. A. Jamieson has been accepted at 77l. 15s. for the erection of a boiler house, etc., at the cemetery. Permission is to be granted to Messrs. Joseph & Smith, architects, 83, Cheapside, E.C., to erect an annexe to No. 46, Edwardes-square, subject to the brick sewer, upon which the building is to be erected, being rammed beneath the invert for the entire width, with Portland cement concrete. The Engineer has been instructed to prepare plans for the making-up of Wallingford-avenue as a new street.

Lambeth.—The tender of Messrs. Laphroche & Co., Ltd., has been accepted at 98l. by the Borough Council for carrying out drainage works at the West Norwood Library. Messrs. Stringer Brothers have had plans passed for the drainage of six houses proposed to be erected in Claverdale-road, Upper Tulse-hill.

Levensham.—Repairs are to be carried out to the footpaths in eleven roads at an estimated cost of 189l. The carriageways of portions of Brownhill-road and Ladywell-road are to be repaired at an estimated cost of 793l. The tender of Mr. J. T. Glogau has been accepted at 178l. for reconstructing the drains at Nos. 30 to 60, Adelaide-road. For executing the necessary paving works in a portion of Stanstead-road, in connexion with the construction of tramways, the tender of Messrs. J. Mowlem & Co. has been accepted for laying 340 super. yds. of Norwegian or Swedish granite paving on concrete, and special grouting, and for 50 super. yds. of Aberdeen granite paving on existing concrete and special grouting, at 21s. 6d. and 19s. 6d. per super. yard. The Borough Council have entered into an arrangement with the London County Council, whereby they will carry out the widening and paving works for the County Council in connexion with the construction of tramways from Catford to Forest Hill, on payment by the County Council of 5,232l. with the actual cost of pipe, etc., alterations.

Middlesex.—The County Council have accepted the tender of Messrs. Walter Lawrence & Son, at 470l., for the erection of a witness's waiting-room, etc., at the Tottenham Court-house. Notice is to be given of the Education Committee's intention of erecting a school in Southgate to accommodate about 400 children.

Mitcham.—The following plans have been passed by the Rural District Council:—Mr. H. Woods, five houses, Eastfields-road; the Mitcham Margarine Company, additions to Tower Works, Commons East; Mr. A. Crisp, alterations to Gorrington Park Hotel, London-road; Mr. J. Wilson, three houses, Ashbourne-road; Mr. E. F. Baverstock, fifty-eight houses, Park, Clive, Robinson, and Ashbourne roads.

Southgate.—The offer of the Patent Victoria Stone Company has been accepted by the Urban District Council for paving a portion of the footpath of the Broadway, Winchmore-hill, at an estimated cost of 150l. Application is to be made to the Local Government Board

for sanction to the borrowing of 1,866*l.* for executing improvement works in Broomfield-lane. The total cost of the work is 2,350*l.* The Surveyor has been instructed to prepare plans for the provision of an open-air swimming-bath at Barrowell-green, similar to that at Chiswick. The following plans have been passed:—Messrs. Edmondsons, Ltd., four shops and houses, Broadway, Winchmore-hill; Mr. W. J. Payne, five houses, Elmwood-avenue, Palmer's Green; Messrs. Matthews & Bennett, six houses, The Grove, Palmer's Green; Mr. H. C. Keene, fourteen houses, The Rise, Palmer's Green; Mr. W. E. Wood, four houses, Hamilton-crescent, Palmer's Green; Mr. W. Simmons, five houses, Conway-road, Southgate.

Southwark.—A sewer is to be reconstructed at an estimated cost of 150*l.*

Tottenham.—The tenders of Messrs. Bradshaw & Co. and Messrs. Grounds & Newton have been accepted by the Urban District Council for tar-paving and asphalt-paving repairs, respectively. Plans have been passed for Messrs. Prestwich & Co. for carrying out additions to a factory in Tariff-road.

Westminster.—The whole area of macadam roadway outside St. James's Palace, at the junction of Pall Mall and St. James's-street, is to be paved with creosoted yellow deal blocks, at an estimated cost of 355*l.*, subject to the Office of Works agreeing to repay the Council the cost of paving that portion under their jurisdiction. The centre portion of Dover-yard is to be paved with 5-in. creosoted pine-blocks, at an estimated cost of 240*l.*, and tenders are to be obtained for the execution of the work. The City Engineer has been instructed to carry out the necessary paving and other works, estimated at 90*l.*, in connexion with improvements in Vincent-square and Rochester-row. Plans have been passed for Mr. A. E. Hughes for the erection of a building in Warwick-road.

Woolwich.—A portion of the carriageway of Powis-street is to be repaved with wood blocks by direct labour, at an estimated cost of 3,500*l.*, and tenders are to be obtained for the blocks required. The tender of Messrs. E. Proctor & Sons, High-street, Plumstead, has been accepted, at 1,050*l.*, for the construction of an underground convenience in Beresford-square. The Borough Engineer has been directed to prepare plans, and tenders are to be invited for the erection of a convenience in Royal Victoria-gardens, North Woolwich. Plans lodged by Mr. T. G. Arnold, 147, Powis-street, Woolwich, on behalf of the Royal Arsenal Co-operative Society, Ltd., have been approved for the erection of ten houses in Rochdale-road, Plumstead.

Deptford.—An error was made in our issue last week, on page 775, in giving the name of Mr. E. C. Pinks as having been appointed to take out the quantities of the new central library to be erected in Lewisham High-road. Mr. G. Silvester, F.S.I., of 4, Adam-street, Strand, W.C., has been appointed surveyor for this work, and he will perform the whole of the Quantity Surveyor's work in connexion with this building.

FOREIGN AND COLONIAL.

Building in Roumania.

The *Nachrichten für Handel* (Berlin) of June 13 states that arrangements have been made for the erection of five new large hotels in Bucharest. In addition, the following buildings are being constructed:—Carol I. University, Military Club, "Credit Roman" Bank, Town Hall, Senate House, and the "Agricola" Insurance Company's premises. Roumanian cement manufacturers had arranged to produce only 12,000 wagon loads of cement this year, but they have orders on hand for more than 24,000 wagon loads.

Building in the Argentine Republic.

The *Boletín Oficial* of May 13 publishes a decree authorising the Superintendent of Military Construction to erect a hospital, isolation wards, etc., in Campo de Mayo. The cost of the works is not to exceed the sum of 450,000 pesos currency (about 39,370*l.*). The same issue of the *Boletín* contains a decree authorising the construction in the Fuerte Militar, Arsenal of powder magazines, stores for explosives, and a laboratory, and the installation of refrigerators. The total cost of these works is estimated at 254,553 pesos currency (about 20,500*l.*).

HOSPITAL, GOOLE.

The new Bartholomew Hospital has been erected at a cost of 7,500*l.* from the designs of Messrs. Hill & Son, of Leeds. The building has accommodation for twenty-four beds, and the contract was carried out by Messrs. Ledgard & Son, of Leeds.

TRADE CATALOGUES.

We have received a leaflet from the National Radiator Company, Ltd., of 441, Oxford-street, W., giving particulars of their Ideal No. 1 B.B. Series water-boilers. These boilers have been specially designed for horticultural work and are fitted with double firing doors, giving free access to all parts of the fire and grate for the easy removal of clinker, etc. The capacities of these boilers, as at present made, range from 710 ft. to 1,435 ft. of 4-in. pipe, and the smoke outlet can be furnished either on front or back as required.

The Carron Company send us a price list of their new series of "segmental" interior grates. The designs shown, fourteen in number, are of a high standard, and there are few schemes of internal decoration with which they would not harmonise.

Messrs. George M. Callender & Co., Ltd., of London Works, Bow, E., and 25, Victoria-street, S.W., send us their illustrated catalogue No. 12, showing views of the various works where Callender's pure bitumen sheeting has been employed. This firm were, in the late seventies, the first to conceive the idea of tempering refined bitumen into pliable sheets. Their trade was at first confined to damp-courses for buildings, but recently came to be associated with successful results for covering railway bridges, lining ponds, and for flat roofs, etc. A pond thus lined as far back as 1885 is still quite watertight. Among the more important works where this material has been employed as a waterproofing medium are open reservoirs at Shildon, Durham; Newquay, Cornwall; and Abbassia, Egypt; filter-beds at Llanelly, Carmarthen; Ivry, Paris; and Galatz, Roumania; swimming-bath at Erith, Kent; the Grand Junction Canal, Tring, Herts.; and the Khedivial Dock at Alexandria.

We have received from Messrs. Hartley & Sugden, Ltd., of Atlas Works, Halifax, and 11, Queen Victoria-street, London, E.C., their latest catalogue of the well-known "White Rose" cast-iron sectional boilers and radiators. We desire particularly to call the attention of our readers to the series "M" boiler, designed especially for shallow stove-holes. A flow socket can be fitted at 39 in. from the floor to centre, to a boiler capable of heating 2,550 ft. radiation. The depth of the firebox is 22 in., and a top fuel feeder is provided, so that the boiler can be stoked to burn ten hours without attention. The interior is easy of access for purposes of cleaning. An excellent line is the cast-iron independent "Lotus" boiler, specially designed for building into the walls of greenhouses, motor-sheds, etc.

PATENTS.

APPLICATIONS PUBLISHED.*

7,956 of 1911.—William Ranson Cooper: Apparatus for heating gas or other liquid.

15,255 of 1911.—James Heaton: Mode of, and apparatus, for manufacturing roofing and the like tiles.

15,334 of 1911.—Alfred Frank Harrison and Oliver Leopold Peard: Heating appliances.

15,782 of 1911.—James Yate Johnson (Edward Joseph Bull): Rolled steel door and window-frames.

16,492 of 1911.—William Henry Fenn: Removable grip joint for wood or metal work.

19,706 of 1911.—Fred Evered Smith: Extension ladder.

22,569 of 1911.—Dr. August Kahr: Machine for manufacturing hollow bricks covered on all sides.

22,991 of 1911.—Carl Oscar Sjöstrand: Utensils for scrubbing and washing floors and the like.

26,332 of 1911.—Otto Rehnitz: Lathing for plaster-work and the like.

28,910 of 1911.—William Baldwin Hough: Spacing and securing devices for the reinforcing members in reinforced concrete construction.

1,360 of 1912.—Henry Robbins Wardell: Bituminous structural materials.

4,909 of 1912.—Nicola Faraldi: Manufacture of artificial stone blocks.

11,222 of 1912.—Charles Showell and John Scrivens: Spring-controlled doors.

SELECTED PATENTS.

691 of 1911.—William Charles Lobbs: Chimney-tops.

This relates to a chimney-top provided with a wind-directed conical hood with a outlet and a vane made from one piece of metal. The vane is strengthened by a corrugation.

1,893 of 1911.—James Muirhead: Ventilators. This relates to ventilators wherein the crown

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

of the roof is cut away and a cover *b* supported by brackets. Between the depending sides *b* of the cover and vertical plan *a*, *a'*, a channel *c* is left, through which air passes, to cause a suction of vitiated air from the building. The air is carried off by valves *d*, *e*, which are operated as required through ropes and levers. The roof ridge is strengthened by distance-pieces placed between the planks *a*, *a'*.

1,893 of 1911.

1,952 of 1911.—Richard Gerling: Slating roofs.

This relates to a metal clip for roofing plates, which consists of a strip *c* with a bent *b* passing through a notch on each of the

1,952 of 1911.

adjacent plates, the upper part of the clip being bent over the plate to engage the support *f*; the lower part *a* under the plate may be provided with a turned-up end *h*, and the bend with a flanged cross-piece *g*, both engaging grooves in the underside of the plates.

2,011 of 1911.—John Cable: Casements, lights.

This relates to means for hanging casement or fanlights comprising a pair of unequal arms pivoted to the window and its frame, *a*, consists in fitting the device to the inside

2,011 of 1911.

the window without cutting the window or frame. The two unequal arms *b*, *h*, are pivoted to a plate or plates *i* fixed to the sill *a* to one or more lugs *3* projecting from plate *a* secured to the inside face of the window.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xxi.; Auction Sales, xxvi. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

JULY 5.—Contestbrough.—ADDITIONS TO CAPITAL.—The Doncaster and Mexborough Joint Capital Board invite competitive plans for addition to isolation Hospital. See advertisements in the issues of May 17 and June 7 for further particulars.

JULY 6.—Cardiff.—FIRE-STATION.—The Cardiff Corporation invite designs and estimates for a new fire station in Westgate-street. Mr. Marshall Meekenzie, assessor. Particulars in the Town Clerk, City Hall, Cardiff.

JULY 30.—Saxon SELL PRIZE.—Fifty guineas, with medal, is offered for essay on "The Lighting, Heating, etc., of an Operating Room for a General Hospital." Particulars from Sanitary Institute, 30, Buckingham Palace, S.W.

SEPTEMBER 1.—Goolie.—MUNICIPAL OFFICES.—Buildings 301, and 161. Particulars from Mr. Tyson, Council Offices, Goolie.

SEPTEMBER 30.—Dublin.—UNIVERSITY COLLEGE: W. BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Hare, F.R.I.B.A.

NO DATE.—Ottawa.—MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa. Particulars from the Public Works Department, Ottawa.

NO DATE.—Jordanihill, Glasgow.—PROPOSED MINING COLLEGE.—Limited to six firms, named in Competition News, December 1, page 635.

NO DATE.—Warrington.—SCHOOL.—The Warrington Education Committee invite competitive plans for the erection of a public primary school. See advertisement in issue February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or names of those willing to submit tenders, may be sent in.

JULY 5.—Cardiff.—ADDITIONS.—For additions to church hall at 21, Arden, and specifications with Mr. Wm. Davidson, architect, Eilon.

JULY 6.—Barnesley.—TERRACE.—The Barnesley Club, Ltd., invites tenders for the erection of a terrace, to accommodate 50, Mr. J. J. Hastie, Secretary, 2, Burlington-gate, Barnesley.

JULY 6.—Belfast.—RESIDENCE.—For the residence of a villa residence, Stranmillis-road, Belfast. Plans and specifications from Mr. Gerald Hume, architect, Crane's-buildings, 1, Wellesford-place, Belfast.

JULY 6.—Coalsland.—ADDITIONS.—For additions and alterations to the Hibernian Hall, Coalsland, Co. Tyrone. Plans and specification from Mr. Neil O'Donnell, Derry, Coalsland.

JULY 6.—Downpatrick.—WARD, etc.—Erection of a casual ward and strongroom at the workhouse. Plan and specification with Mr. R. L. Brown, Clerk of Union, Clerk's Office, Downpatrick.

JULY 8.—Barnard Castle.—COTTAGE.—For erection of cottage at the Lartington filter beds, Barnard Castle, for the Tees Valley Water Company. Plans and specifications with Messrs. R. Hume and Sons, architects, 129, Albert-road, London.

JULY 8.—Bexley Heath.—OFFICES.—Erection of new offices, sanitary improvements, general painting and repairs at the school. Specifications and plan by the committee's architect, Mr. Wilfrid H. Robinson, of Caxton House, Westminster, with Mr. Walter J. Weaving, 199, Newway, Bexley Heath, Kent.

JULY 8.—London.—FACTORY.—For erecting a factory for the O. T. Company, Ltd., at Green-gate, Blackfriars. Quantities and forms of contract from Messrs. Henry Langston & Co., architects and surveyors, 1, 1, and 3, The Exchange, Southwark-street, S.E.

JULY 9.—Moorhouse.—HOUSES.—Erection of 12 houses at Moorhouse. Plans seen and specifications from Mr. W. T. Turner, architect, etc., 1, The Hill, Barnesley.

JULY 9.—Durham.—IMPROVEMENTS.—The Eastern Railway invite tenders for carrying out improvements at Durham Station. Plans and specification seen, and quantities and form of contract from Mr. William Bell, the Company's Architect, Westgate-road, Newcastle-on-Tyne.

JULY 9. London. EXCHANGE.—Erection of Victoria new telephone exchange. Drawings, specification, and a copy of the conditions and form of contract with Mr. J. Rutherford, 22, Carlisle-place, London, S.W. Quantities and forms of tender on deposit of 11. 1s. from the Secretary, H.M. Office of Works, etc., Storey-gate, London, S.W.

JULY 9.—Shrewsbury.—WALL.—For rebuilding wall, laying concrete paving, supplying and erecting unclimbable iron fencing and other work adjoining north side of river and below Welsh Bridge. Specification and drawings seen and quantities and form of tender, on deposit of 11. 1s. from Mr. W. Crisp, 14, Newgate-street, Shrewsbury, Borough Surveyor's Office, The Square, Shrewsbury.

JULY 10.—Chester.—MILL.—Erection of a new mill, etc., Brook-street, Chester. Quantities and form of tender from Messrs. John H. Davies & Sons, architects, 14, Newgate-street, Chester, on deposit of 11. 1s.

JULY 10.—Newport.—ADDITIONS, etc.—Alterations and additions to the offices, Pentonville, Newport. Plans and specification with Mr. William Tanner, F.S.I., County Surveyor, Newport, Mon. Quantities on deposit of 11. 1s.

JULY 10.—Thorne.—ADDITIONS.—For the erection of additions to the male wards of the workhouse infirmary. Specifications and plans at the workhouse.

JULY 11.—Bedding.—ADDITIONS.—For alterations and additions to Seagrave Wesleyan Chapel, Bedding. Plans and specifications with Mr. T. Edmund Rees, architect, Bank-chambers, Mersey Tynd.

JULY 11.—London.—LIBRARY.—Erection of a branch library building in Brooksby's-walk, Homerton. Plans and specification seen, and quantities, with conditions, form of tender, and form of contract, from the architect, Mr. Edwin Cooper, F.R.I.B.A., 12, Gray's Inn-square, W.C., on deposit of 21. 2s.

JULY 12.—Ashton-under-Lyne.—LAUNDRY.—For erection of a new laundry, chimney, etc., at the district infirmary. Plans and quantities from the architect, Messrs. W. H. George and Sons, 7, Watlington-street, Ashton-under-Lyne.

JULY 12.—Durham.—LOCK-UP.—Erection of a new lock-up at Bolden Colliery. Plans, specification, and conditions of contract seen and quantities from Mr. William Croser, A.M.I.C.E., County Surveyor, Durham.

JULY 12.—Mansfield.—BATHS.—For erection of slinger bath at Plessey Hill, Mansfield. Plans, specification, and quantities, on deposit of 21. 2s. from Mr. T. P. Collinge, A.M.I.C.E., Borough Surveyor, Exchange-row.

JULY 13.—Walsall.—ADDITIONS.—For alterations and additions to Croft-street Infants' School, Walsall. Drawings, specification, and quantities from the Borough Surveyor, Council House, Lichfield-street, Walsall.

JULY 15.—Dewsbury.—STATION.—Erection of a fire engine station. Specifications and plans and quantities from the Borough Surveyor, Town Hall.

JULY 15.—East Barnet.—SCHOOL.—The H.C.C. Education Committee invite tenders for alterations and additions to Brunswick Park School. See advertisement in this issue for further particulars.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

and the Editor cannot

ations; and the Editor cannot be responsible for the return of drawings, photographs, or documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should be accompanied by the address to which they should be sent, either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Drawings, photographs, or models of articles, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when accepted, by the Editor, who retains the right to reject or to use, in whole or in part, any drawing or photograph if, upon publication, it type does not necessarily imply its acceptance.

Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 6 p.m. on Wednesday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100L. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

SANENESS IN ARCHITECTURE.

IT is a matter for congratulation that passing phases do not pursue architecture so relentlessly as they do the sister arts. Architecture is too intimately concerned with the business of life to be lifted from its foundations by the gospel of yesterday. An art of three dimensions also moves slowly, whether forward or backward. "L'Art Nouveau," as it has been called, has, for instance, afflicted architecture but little. In Germany alone perhaps has it made itself an actuality. Yet from Germany also comes a voice sounding across the century, the voice of Goethe, the greatest of modern prophets, uttering a note which is in great measure the key to his article:—"The discerning man who acknowledges his limitations is not far off perfection."

It is a just recognition of the limitations imposed upon us, in the first place by tradition, and in the second by the exigencies of material, opportunity, and environment, that conduce to the saneness of design. "The new art" was born of a restlessness that fell upon us reasonably or unreasonably—the latter, as

we think. The desire for change enters by nature into every department of life, art included. The legitimate course of change is by evolution, by development. But change nature will have, and if retarded by too fixed conditions, or by a lack of stability in her agents, existing conditions are reduced by violence. Regions which enjoy prolonged climatic conditions, are visited by tornadoes. When social economies are at a standstill revolutions occur. Periods of rest which inevitably follow those of exceptional creative activity are certain to be invaded by changes introducing tendencies that have in themselves little or nothing to justify them—little puffs that fill the sail for the moment and leave it flapping as idly as before. There can be no doubt that the arts collectively are suffering comparative exhaustion consequent upon the Victorian period.

This era, once considered as almost a byword of reproach concerning the arts, we cannot doubt will be ultimately recognised as among the greatest epochs of their development. It was unfortunate for them that science took precedence and saturated the thought and

expression of the time. Construction was mistaken for architecture, imitation for the motives of painting and sculpture. Ruskin, the brilliant spokesman of the arts, was unfortunately chief among the misguided. In the cause of "truth" art shivered in her nakedness. In this wise the romanticism heralded by the poetry of Wordsworth, Coleridge, and Shelley was handicapped from the first, when it took the form of "Gothic revival." The Pre-Raphaelites best weathered the danger. They were saved by the *raison d'être* of their art, the magnificent opportunities of colour. To-day, alas, we have few enthusiasms! Yet we may adopt a saneness of outlook wherewith to protect ourselves from the lust of change, engineered by the "unchartered liberty" of an unrestricted age. We may embrace the "freedom and content to be obtained only by the recognition of one's limits," and first and foremost among these limitations are those imposed by tradition. Revolt against tradition is much in the air at the moment. "You must go back to childhood," says the painter, or at least an influential section of the painter's

professional critics. It is in the semi-articulate lipings of the infant wherein true expression is to be found. Need we say that there is no going back? Poor, struggling humanity would not be where it is now if that gate had ever been open to it.

"Accept the place the Divine Providence has found for you, the society of your contemporaries, the connexion of events. Great men have always done so, and confided themselves, childlike, to the genius of their age." In this sense we may be children still. Nor is architecture without a tendency toward similar leanings. We refer to a noticeable return to the studied simplicity of the Neo-Greek school. When Stuart and Revett published their "Antiquities" a wealth of unsuspected beauty was revealed. It was a second classic Renaissance. Enthusiasm was natural and unbounded. Moreover, it came to a time when the "Grand Tour" was the necessary finish to all polite acquisitions. Its appeal was irresistible. These conditions do not prevail now. It must be conceded that such a style is safe, but, at the same time, it provides a possibility of starving and restricting architectural resource.

Restraint is a salutary quality in design of the first order. The Pantheon at Rome is an eminent example. With no accessories to assist it, it achieves the summit of architectural expression. There is exuberance in the daring of its conception. And there is exuberance in all art which is great. It belongs to the masterpieces of Greece, though due, it should be remembered, not to the architectural display alone, but to the combined effort of architect and sculptor. The ruins of the Parthenon arouse admiration, but it is left to our constructive imagination to realise its superlative grandeur when possessed of its sculpture and colour. What would the Mausoleum have been without its crowning Quadriga and the sculpture that peopled its base? Must not a Greek Renaissance, unless sculpture is prepared to play its part, be always at a disadvantage?

Tradition is something more than the acceptance of a phase which had its special significance in its own time. To isolate it is to turn a part of the natural current of tradition into a backwater. No sane person would endeavour to check individuality in design. But there is so much else in our history, and a national architecture can only be evolved by a full and generous appreciation. The freedom sought for in mediæval building may still seek expression though coupled with a style the modern world has found more useful and adaptable, more sympathetic. The genius of Wren and his successors is embodied in the cleavage between the old order of things and the new. With the Stuart revolutions the political and social conditions which now prevail were established. Wren created an essentially national architecture, and, whatever developments time may demand, it must retain its position as the corner stone of progress. In his detail alone he will be ever an example. Detail, right in itself, was put in the right place. Yet we cannot but fear that something of his influence has been jeopardised by the carelessness in

such particulars shown in some of the recent building by those who would presumably be his followers. To play with the accepted treatment of textbooks is permissible, and in resourceful hands this may be, and has been, successfully achieved. There is, moreover, often no authority for what has been tacitly accepted as orthodox. We believe it is now acknowledged that the Mausoleum entablature possessed no frieze, although all restorations indicate the contrary. But we have been even led to wonder in some prominent instances of ill-considered caprice whether architecture is really a serious pursuit or some new form of open-air recreation.

This is the converse of saneness, which shows a nice sense for proportions and values, while its converse stands as a definition of vulgarity—whether it outrages our sense of decency by exaggeration or bores by its banality.

Architecture enjoys opportunities today that have been denied it in the past. It no longer has to face an era of *laissez-faire* when commerce was grudging, and a narrow commercialism cast an eye of suspicion upon "improvements."

The demands made by material have for some time past received more adequate recognition than formerly was the case. Indeed, there are some who think that material should dominate over all other architectural claims. A new and individual treatment for steel and concrete construction is pressed. Yet this construction forms only the skeleton of a building. It creates no new static essentials. The Parthenon owes its distinctive character to the obvious treatment of column and beam; Santa Sophia to dome and rounded arch; Beauvais to the thrust of groined vault and pointed arch. We may reasonably hesitate to bestow on a reformed girder the dignity and sanctity of a style, and there is surely something of the narrow purview of the Gothic revival about the claim. Theories are a menace to art. There are certain materials that appeal for care. The rigidity of steel is extremely useful, and it is not impossible to accept its services without misgiving.

The limitations imposed by opportunity—limitations which we must come to terms with for better or worse—are paramount in an era of town planning. They have been cruelly neglected. New streets have been cut and warehouses and offices erected on them—we are thinking of the City precincts especially—which are outside the pale even of discussion.

Yet town planning is not entirely a new thing. The Adam Brothers added a vast number of streets to the West End that are not without character. That their architecture is often unpretentious may be esteemed a virtue; but there is often more in it than the hasty survey reveals. The proportions of window openings have been carefully considered. The façades are broken by strings put just where they ought to be, while many of the doorways are masterpieces. Dealing with areas instead of small or isolated plots, they were enabled to group into blocks and form terraces.

The Woods, of Bath, contrived to build the finest modern city in the kingdom. Queen-square, Bath, in which each side is treated as an architectural

whole, is a lasting monument to memory. The squares of Blooms are, or were, the pride of London. Regent-street belongs to the category, though let us hope that the new scheme for its rebuilding may take some pride in it still. It is a matter of regret that garden suburbs failed to realise the advantages of town planning. Had each house a sufficient area of garden to make its independent, rather than assumed, the experiment would be justified. But the jostle each other as to dispute each other's attainments. In some reason, uniformity might be found peace.

Some people are sensitive to what we may call the "genius of place." Ruskin was alluding to the same thing when he wrote "The Poetry of Architecture." Here the saneness of architecture is often sorely tested. It is not familiar with the half-timbered curiosities considered suitable to cathedral city, although its period of greatest renown may be far removed from the mediæval. Or, again, a country house which is not a country house, or something which should be simple to avoid striking the garish where its surroundings are dignified.

Vulgarity is painfully insistent in such situations as these. Indeed, far too many opportunities are offered the public for hostile criticism of architecture. Yet, despite such occasions we believe and believe, as we are with saneness upon our side, that architecture holds its own with credit among the arts. It has not been found wanting in emergencies. The demand made by the London School Board for suitable buildings thirty years or so since, adequately met, and these school buildings are no unfit architectural monuments to the cause of education. Provincial municipal building, recent so much on the increase, has evolved a style in not a few instances worthy of its purpose. Where works of importance secured by competition have been criticised it must be remembered that the professional assessor is quite late arrival upon the scenes. The public has been itself the judge, and it selected the least praiseworthy designs. Or, again, the exigencies of law have intervened, and a design has been mutilated to avoid an injunction, if not penalty, while the stringency of the Local Government Act strews difficulties in the path. The public has not been the aid of an intelligent interest as has in France. It has praised where it should blame, and blamed where it should praise, and the professional art critic more at home in a gallery than in the street. There are, however, recent evidences of public movement. Town planning has become quite a topic of conversation. And this is all to good. Mutual understandings remove individual misconceptions.

WANDSWORTH COMMON.

The Parks Committee of the London Council suggest that the Council should contribute 6,000l. towards the acquisition, use as a public open space, of about 100 acres of land adjoining the Royal Victoria Patriotic School, Wandsworth Common. Between the years 1891 and 1911 the population of Wandsworth increased from 155,320 to 311,402.

No. 95. Design by Messrs. Shephard & Bower.

OUR REGENT'S QUADRANT COMPETITION.

THE award of the first prize to the excellent design by Messrs. Richardson & Gill, which we publish in this issue, will, we expect, most probably be taken as an expression of opinion on the part of the assessors that the elevation of the Piccadilly Hotel is so entirely unsuitable as shop-fronts, and so lacking in the special character appropriate to Regent-street, that any attempt to secure a general harmony of effect by carrying on the same style or the actual features and details would not lead to a satisfactory result. If we accept the unsuitability of the hotel as an axiom needing no demonstration, we can understand that the more the new façade attempts to repeat the old one the less suitable it becomes for its position and for the purposes for which it would be erected. From this point of view, then, complete harmony of style with the Piccadilly Hotel is not the important thing—not of the essence of the problem.

Those who take the opposite point of view and who hold that the present building is capable of such modification as would render it suitable to the retail trader and to general business requirements might perhaps be inclined to think that the winning design has so completely ignored the hotel as to run a risk of being thought to ignore this aspect of the problem also. This, however, is a matter of opinion on which the Assessors would be expected to exercise their own judgment.

The strong individualistic tendencies of English designers have always been opposed to restrictions of any description, but the disastrous effects of the absence of restrictions in our towns have led to a general recognition of their necessity. But even in the Continental cities where individuality is not so

highly esteemed it is not always found advisable to do more than insist on a general height for main cornices, trusting to the unity of style and sentiment which usually prevails, to produce the general harmony of effect required. It can easily be understood, then, that anyone holding the view that the hotel design is impossible might well consider that the winning design, by conforming to this restriction, has done all that can reasonably be expected as a concession to the existing building.

The trouble is that in this country there is no general unity of style or sentiment of sufficient strength to be consistently relied upon. To harmonise a white stone classic building with, say, a red brick Gothic one something more than an equality of height seems necessary, and although in this particular case the character of the winning design may be such that nothing more is required, it would hardly be safe to lay it down as a general rule that so long as the main cornice lines carry on we may confidently rely on producing general harmony of effect. In a quadrant such as this more particularly special value might well be attached not only to an unbroken sweep of horizontal lines, but also to continuity in the spacing of the vertical ones and in the general character of the design. It is difficult to see where it can be varied to advantage. Other things being equal, a quadrant might well be designed throughout by the same hand; but when it has been begun in a style which the Assessors appear to think unsuitable the problem of its completion raises so many delicate questions and involves so many apparently conflicting points of view that the choice of any one design as being a complete solution of the problem becomes a matter of much difficulty or even embarrassment.

One of these difficult points is the question of the roof, which does not appear to be settled in an altogether

satisfactory manner by the winning design. Granted, as a general rule, that a strong crowning line having been established to carry the eye round the sweep of the quadrant, the features above it are relatively unimportant, and, as a matter of fact, not very noticeable in execution; still, in this case it really is rather difficult to imagine a satisfactory skyline to the quadrant if the hotel roof is to be left in its present condition. It is a question whether, however excellently the sweep of the façade may be treated, this roof is not too high and too noticeable to be ignored, and whether some treatment is not essential that in some way connects the roof with the angle building and mitigates the present unhappy effect of the unfinished gap at Air-street. This, however, is a question in which the competitors appear to have been equally divided, about one-half of their number carrying the present roof on, with or without slight modification, as may be seen in the three other premiated designs by Mr. Albert Moore, Messrs. Tait & Whitelaw, and Mr. Drysdale. The first of these is reproduced as one of our plates in this issue, and the other two will be published in due course. As they are referred to in the Assessors' report, which appeared in our issue of the 5th inst., no special mention of them is necessary, but we should like to take this opportunity of congratulating Mr. Drysdale on his charming suggestion for the treatment of a shop-front which has met with well-merited recognition.

A full half of the designs submitted show adaptations more or less successful of the Piccadilly Hotel, many of them seemingly influenced by the point of view that as the building is actually in existence and must remain it settles the general treatment and scale of the quadrant. In these circumstances, therefore, the best thing is to carry on this treatment with the necessary modifications, as by this method the whole

No. 130. Regent's Quadrant Competition. Design by Mr. E. Fraser Tomlins.

quadrant can be dealt with as one complete design. It might well be thought that a completely harmonious conception of the whole sweep of the quadrant, providing for the practical requirements of the shops, even though the general result was somewhat out of character and scale with the nature of the street, would be more satisfactory in the end than the erection of buildings more in character with the street but less in scale and character with the hotel, even though they were pulled together by one or more general horizontal lines.

From this point of view a satisfactory harmony with the hotel would appear to be of the essence of the problem. Other things being equal, the greater this harmony the better the design. If this point of view is correct, the problem is simplified considerably, as the issue is narrowed down. But it rather seems to assume that the present building is so exactly suitable to its position and purpose as to be worth repetition, or that it is advisable to repeat a mistake for the sake of continuity of treatment.

These are propositions which the Assessors do not seem to have been able to accept, but had they done, so their task would have been lighter, as, given the limitations of this point of view, the problem of balancing the concessions to the trader with the preservation of the general character of the hotel would, we think, be a comparatively easy one.

The various ways in which this has been attempted are worthy of study. Some competitors carry on the entire design, but hope to conciliate the shopkeeper by lessening the size of the arch piers to such an extent as to suggest an appearance of dangerous insecurity. Others, who wish to retain the arches for the sake of continuity of treatment on the ground floor, repeat only single

instead of double columns, thereby making a thinner pier more structural in effect on the ground floor, but lessening the continuity of treatment on the upper ones.

Evidently there has been a strong feeling among many of the competitors that it was advisable to carry on the general vertical treatment of the upper floors of the hotel, and a comparison of the various designs suggests that where it is desired to preserve an unbroken rhythm of strongly marked vertical divisions, equality of spacing in the intercolumniation is well-nigh essential. But the repeat of these columns seems to lead to difficulties in adopting the design to practical business necessities. It calls for the continuation of the whole depth of the entablature, a most wasteful feature, and also for wider piers between the shops than would be otherwise necessary. Some designers try to get over the difficulty by repeating the coupled columns and by making the piers below of sufficient width to take small windows or doors, some put single columns and piers as fine as is consistent with an appearance of strength, while others boldly place their single or coupled columns over a plate-glass window.

It seems only reasonable to suggest that where it is essential that the lower story of a building should be of glass the application of an order to the stories above is a gratuitous creation of difficulties. The large opening seems to call for a horizontal treatment above it, not for strong vertical lines which attract and offend the eye by their absence of apparent support. An order on the first floor should express something definite, such as the council chamber of a town hall or the *piano nobile* of an Italian palace, and we can at the moment think of no type of building which naturally demands a large order on the upper floors with a ground floor of glass below.

The application of this principle to the present problem is no doubt one of the inherent difficulties, particularly to those who think it essential to preserve unbroken continuity of vertical treatment round the whole sweep of the quadrant.

Others, however, have appreciated the practical and æsthetic advantages to be obtained by the omission of the columns and appear to have aimed at a compromise which does not require the de-entablature above or the arches or heavy piers below, but which, at the same time, preserves the general character of the hotel, though it loses any advantage there may be in an exact repeat of the spacing of its vertical divisions. This treatment is well illustrated by No. 9 by Messrs. Shephard & Bower, a design we now reproduce, together with others by Mr. E. F. Tomlins (No. 13) and Mr. W. Harvey (No. 44). A number of these, as well as No. 124, by Messrs. R. Cromie & T. H. Gibb, which we hope to illustrate in a later number, are designs which appear to us to have some special interest and merit, though they are not necessarily those which in our opinion present the best solution of the problem.

It will be remembered that the answer to questions left it open to the competitors to treat the upper floors as showrooms or as offices at their own discretion. The introduction of a large store on the lines of Selfridge's or the Magasin d'Étampes in Paris, which needs a glass treatment up to the main cornice, appears to complicate needlessly the problem, and to make it still more difficult to obtain any harmony of treatment with the general character of the neighbourhood, which consideration appears to have had some weight with the Assessors. But at the same time it is evident that such a treatment, as illustrated by Messrs. Tait & Whitelaw

gn, or, again, by No. 36, by Mr. Cyril
ey, affords more opportunity for
ying on a columnar treatment on the
er floors in a logical manner, and
ugh a street of large stores would not
the Regent's Quadrant we know, or
e the character of a shopping street
h offices or rooms above, there seems
be nothing in the conditions which
vents its transformation into a street
large stores more typical of certain
mercial tendencies of the day. To
end the general setting out of the
el façade appears more suitable than
the treatment which has been awarded
prize.

It is impossible, however, for us in the
ce at our disposal to deal with all the
eral considerations which this interest-
competition suggests. Neither is it
sible, where so many drawings are
cerned, to refer to them all in detail.
ere are many of great merit, whether
designs or as drawings. Apart from
designs which we hope to reproduce,
se of which we made a note as illus-
trating some point that interested us
are as follows:—No. 58, by Mr. L. E.
liams; Nos. 49 and 50, by Mr. W. H.
llow; No. 34, by Mr. L. H. Rose;
71, by Mr. T. Baddock; No. 88, by
W. E. Vernon Compton; No. 68, by
L. S. Sullivan; Nos. 105 and 107, by
fessor Beresford Pite; No. 108, by
rsrs. Horace Field & Simmons; No.
by Messrs. F. E. Williams & Alfred
; No. 117, by Messrs. Greenaway &
vberry; and No. 3, by Mr. Philip
den.

This list, however, by no means
hausts the number of those designs
ch appeared to us to show con-
erable merit, and we can only repeat
thanks to one and all for contributing
the success of the competition.

If we cannot flatter ourselves that the
result of this competition has been to
produce any one design which will be
generally recognised as a complete
solution of the problem from every point
of view, at least we may be permitted to
hope that it has exposed certain aspects
of the question to which attention had
not previously been directed, and that it
may have suggested the lines on which
the whole problem may ultimately be
solved.

NOTES.

The Personal Qualifications of the Architect

In the leading article of
a previous issue we called
attention to the benefits
which might be expected
if all those who entered the profession
possessed the natural aptitude, taste, and
type of mind necessary to genuine
success. We suggested that some
method, in which the public schools and
Universities might possibly co-operate,
should be adopted for encouraging the
right type of student to enter the profes-
sion and for discouraging the wrong type.
We are interested, therefore, to notice
that the Slade Professor of Fine Arts at
Cambridge, Mr. E. S. Prior, has referred
in a recent address to the personal
qualifications characteristic of the archi-
tect and of the craftsman. It is to be
hoped that the subject will be con-
tinually kept in mind at Cambridge, and
that opportunities will arise for an
interchange of ideas between the various
Universities and those responsible for
our present system of architectural
education with a view to the advisability
of taking combined action in the
matter.

The Exploitation of Monuments of Historic Interest.

THE exploitation of our
national monuments
promises to become a
serious business, unless
the State steps in, as in
Italy, to preserve its
national treasures. From a correspond-
ence in the *Times* a little while ago it
appeared that Stonehenge might, at the
caprice of a private owner, be transported
to America. That is not likely; but the
mere fact that it might in certain circum-
stances be possible, suggests a danger
against which the country should be
forearmed. In a general way the private
owners of objects of historic interest are
not indifferent to their possessions and
guard them loyally, notwithstanding
considerable temptations to part with
them. And the rights of a private owner
should only in the very last resort be
interfered with. The old Globe Room
has been removed from Banbury, and a
certain section of the Press is creating
considerable agitation on the point.
Probably no class of the community can
better appreciate the value of the old
Globe Room than architects, and we
certainly should like to see this specimen
of domestic work retained in this country.
But there are national treasures and
national treasures; and the old Globe
Room is by no means an only or unique
specimen of its kind. The older type
of vandal who was indifferent to such
historic documents has been succeeded by
a new type of vandal who regards them
largely as objects for profit and com-
mercial exploitation. If this sort of
transaction is encouraged, the inflated
prices which are asked for old masters
in painting will extend to everything
removable which a country may most
desire to preserve. The old Globe Room
has, however, now been transplanted, and

No. 44. Design by Mr. William Harvey.

the historic interest largely departs with transplantation. The old Globe Room adorning the sumptuous habitation of an American millionaire can never be quite the same thing, or possess quite the same interest, as the old Globe Room *in situ*, in use as an inn parlour at Banbury. In any case, we need not be alarmed at the cry of "Going—going—gone!" in this particular instance, although it is sufficiently serious to indicate a warning in regard to the preservation of works of art and craft which have some claim to be considered of national interest and historic value.

Proposed Destruction of Whitgift Hospital.

OUR readers will remember that some twelve months ago an application was made by the Croydon Borough Council to the Local Government Board for powers to compulsorily acquire the Elizabethan almshouses known as the Whitgift Hospital, and that Mr. John Burns gave the matter his personal attention. This proposal was brought about by the fact that the main street, which is very narrow, is gradually being widened, and Mr. Burns refused to give his decision until the Council had submitted the whole scheme for widening. On Monday, the 8th inst., four schemes were presented by the Streets Improvements Committee to the Borough Council, the one which they recommended continuing the line of widening: this, if carried out, means the demolition of about half the hospital to widen the George-street corner. We hope that the opposition of public opinion to this piece of vandalism will be strong enough to prevent the demolition of any portion of this ancient edifice. So many of our historic buildings have been ruthlessly swept away or improved out of recognition that we can ill afford to lose such a well-known landmark.

Burial of Sir Lawrence Alma-Tadema.

THE remains of Sir Lawrence Alma-Tadema were buried, with all the distinction and circumstance to which his qualities both as an artist and as a man entitled him, at St. Paul's Cathedral on Friday, July 5. The ceremony was imposing and beautiful, and was largely attended by royal and civic representatives, by men of distinction in all paths of art, as well as by a large number of the general public. Architecture was represented by Sir Aston Webb, Sir Ernest George, Mr. Reginald Blomfield, Mr. John Belcher, and many other members of the Institute of Architects, of which the deceased painter was a Gold Medallist and an Honorary Fellow. It is, we believe, an unsettled point whether Sir Lawrence was ever naturalised as an Englishman, although he became one by acclimatisation and sympathy. His temperament and certain essential characteristics of his work remained, however, those of the country of his birth and descent, rather than that of his adoption. In this connexion it is a little curious to note that the first great painter to find a resting-place in St. Paul's, at the age of forty-two, was Van Dyck, also a Dutchman. This was in 1641 and, therefore, in the old Cathedral.

EXHIBITION OF DRAWINGS AND SKETCHES AT THE BRITISH MUSEUM.

SIR SIDNEY COLVIN's term as Keeper of the Prints and Drawings, a position which he has held since 1883, has come to an end. The exhibition of original drawings and sketches, therefore, which has been recently opened in the gallery adjoining the Print Room at the British Museum will be the last organised and arranged under his official control. The collection only comprises works which have been acquired during the last eight years, but it provides ample testimony of the taste, discretion, and broad-minded judgment which have obtained in the department over which Sir Sidney Colvin has presided for so considerable a period. Many of the finest exhibits have been presented, others have been purchased—319 have, in fact, been purchased out of a total number of 565. The purchases are probably directly due to the initiative of the Keeper or his assistants; the almost priceless gifts may have been often indirectly due to the same source of inspiration. At any rate, they are a tribute to the faith of great collectors in the competence and care of this department of our national collections. It is not our object to indulge in a panegyric of the late Keeper, but as this exhibition has been opened at the moment of his retirement we should be an ungrateful public indeed if we did not render passing homage to the value of labours which have operated so beneficially on behalf of our national artistic effort.

The exhibition covers a large area of artistic effort; it includes both great and comparatively small masters—the old masters of various continental schools, of the British school, and some examples of British artists who are still living. None can complain of a lack of catholicity in the acquisition or choice of these specimens. From the point of view of architecture there is much in the general type of the drawings to interest the student of draughtsmanship, while there is a certain number which possesses a more direct architectural value. From an album of eighty-four original drawings, for instance, by Piranesi eleven examples are shown, which illustrate his adventures in fanciful creation in architecture, either in the Roman or Renaissance manner, in many of which there is a good deal of delightfully free and interesting penwork. Equally fanciful, but the conception of a more formalistic and conservative decorative gift in the rococo manner which he affected are four designs for stage scenery by Bibiena (Giuseppe Galli). There are also an interesting classic ruin with figures by Pannini, a Venetian view by Guardi, and, to come to the Dutch school, an effective drawing of a palace on a wharf by Moucheron. Canale is represented by six drawings which admirably illustrate his genius for topographical precision combined with pictorial composition and atmosphere.

There are many more or less fugitive examples of architectural or purely decorative draughtsmanship to be found among the artists of the British school; and certainly the *bonne-bouche* of this phase of the collection is to be found in the fourteen drawings by Alfred Stevens, which are not only valuable on their own account, but also on account of the light which some of the earlier drawings throw upon his native artistic instinct and evolution as an artist. They also display his gifts as a decorative designer in vases and other smaller forms of ornamental and plastic art. Among other drawings of the same school which may be noted, but which are not of great importance, are a sketch for the decoration of Burlington House staircase by Stothard, the drawing of a Tudor chimneypiece by C. R. Leslie, two water-colours (the Doge's Palace, Venice, and a view of Segesta) by Charles Vacher, and a Corfe castle by Joseph Nash. A

view in Paris by Richard Parkes Bonington is a brilliant example of an English artist realising in his own country. Mr. Muir Bone and Mr. E. H. New possess the distinction of a place among the few examples of work by living artists.

For the rest, the collection as a whole has been seen to be appreciated; it contains examples of the world's greatest master-painting. When Dr. Burnet's addition to the British Museum is available for use, a portion of the new building will, we understand, be allocated for the permanent exhibition of original drawings and sketches. We have often insisted in our pages on the value of an artist's drawings, sketches, on their importance often veritable works of art which in inspiration and genuine artistic vitality may surpass works of more elaborate workmanship by same painters. In any event they go to show the processes of achievement in the making as in the case of the wonderful Titoretto sketches in tempera at the present exhibition. Titoretto was counted as the great *improvisatore* among painters, but in pictures, we find, involved many conscientious experiments before he arrived at the effect of fluency and ease hitherto ascribed to improvisation.

WINCHESTER CATHEDRAL.

ON Monday next, the 15th inst., the King and Queen will attend a Thanksgiving Service at Winchester Cathedral, and afterwards visit Winchester College. We propose to deal in our next issue with the past and present condition of this most interesting cathedral. Meanwhile we are able to print the official Report of the architect, Mr. T. G. Jackson, R.A., to the Dean which is as follows:—

14, Buckingham-street,
Strand, W.C.
May 1, 1912

DEAR MR. DEAN.—As we are now after seven years' work arrived at the last stage of the repairs that have been contemplated may be useful for the information of your subscribers, and the public generally, if I give a brief account of what has been done.

It is hardly necessary to repeat that the cause of all the mischief is the nature of the foundation. The whole Cathedral stands on a bed of compressible, loamy soil overlying peat, which in some places is 7 ft. thick. This rests generally at a depth of from 20 to 24 ft. on a compact, hard gravel, heavily charged with water; but in some cases there is a thin bed of soft, chalky silt between the two. It would hardly be possible to find worse foundation on which to place a heavy building.

The case is complicated by the fact that the whole of the subsoil at the depth of 10 ft., and in some seasons less, is charged with water, and it was on reaching this that the old foundations stopped, the Norman and medieval builders having no means of coping with the difficulty.

The first part that excited serious alarm was the south wall of Bishop de Lucy's Retro-choir. This wall had sunk from 7 ft. in the middle to nearly 2 ft. at the east end, and had split off from the Norman work on the west of it, leaving a crack 5 in. wide.

On examination it was found that the wall rested on a double layer of beech-tree laid crossways, which had been forced down into the soft ground to the extent first mentioned. The north side was not much better, and in both cases the vaults had overpowered the walls and thrust them out of the perpendicular, tearing the buttress piers, of which the thrust was concentrated, away from the curtain walls between them. The movement of the walls had dislocated the stone vaults, which were bulged and cracked in all directions, the ribs having sunk so badly as to have lost their curve of stability, and being only prevented from falling by being bolted to timbering above. The situation was critical, for on February 26, 1906, a stone did actually fall from the groining

the north presbytery aisle, near Bishop Wykeham's Chantry, and more was ready follow.

The vaulting of the crypts was disturbed throughout, partly by the movement of all the walls, and partly by the settlement of the piers from which the vaulting sprang. The condition of the choir and choir aisles is not quite so dangerous as that of the presbytery, but the walls were seriously cracked and the vaulting of the aisles so much disturbed that parts were actually unsafe.

The great transepts of the original Norman building were in a condition to cause the most anxiety. Cracks had appeared in the walls of the north transept so large that daylight could be seen through them, and in the north end and the side walls were located in all directions. But the south transept was far worse, the end wall being broken away by great fissures from the side walls and having an inclination of over 10 ft. in a height of 120, which nearly brought the centre of gravity outside the so. The side walls also were badly ruptured, and that on the east inclined seriously towards.

It was expected that farther westward the undation would not be so bad, but we were disappointed to find it no better in the nave than at the east end. In fact, one of the west piers is on a line across the church at Wykeham's Chantry. The south wall, consisting of Norman work cased with Perpendicular masonry, leans seriously outward, having drawn the roof away from the clear-story of the nave and caused the flying buttresses, which are concealed under the roof, to be seriously combined with the transverse ruling ribs of the aisle, to drop and come disjoined.

On the north side the same settlements occurred. To this side Bishop William Wykeham had applied buttresses with uncles; but, as their foundation was not so deep as that of the Norman work, they have done more harm than good by leaning on the wall instead of supporting

The central tower, which is not of Bishop Wykeham's building, but was rebuilt after the fall of his tower in 1107, is cracked in several places.

The best part of the structure, as regards ability, is Bishop Edington's west front, and the short length of the nave which he built. His front stands on the east side of the massive western towers and porch of the original building, which projected 40 ft. farther westward.

This general disturbance of the walls affected the flying buttresses of the choir, which had sunk and were in imminent danger of falling, their abutment having given way and drawn them away from the masonry wall. The choir vault, being of good, has little thrust, if any, but it is remarkable that the flying buttresses in other parts of the church which are opposed to one vaults have given way, owing to the walls of abutment having gone outwards, and not owing to the pressure of the nave vaults, which they have left standing securely without them. Those in the choir, of course, merely ornamental, and those of the nave appear to be unnecessary.

I need hardly say that the problem before me when you consulted me in 1905 was very difficult of solution.

It was obviously necessary to replace the old foundation by something solid, but the old hard bottom to be found was the gravelled at a depth of 20 ft. and more, 10 ft. below water level. The underpinning on the gravel of one corner of the church which I first undertook was not altogether satisfactory, and proved very expensive. With your consent I thereupon consulted my friend Mr. Francis Fox, the Civil Engineer, who had, I knew, great experience of subaqueous building, and by his advice a diver was employed to lay the lower courses of the underpinning under water, on which the masons and bricklayers carried the rest up to the old foundations.

In this way the Retro-choir and Lady Chapel were underpinned successfully.

The question then was how far to continue the underpinning of the rest of the Cathedral. The whole of it stood on the same soft beds, and the ideal remedy, of course, would have

been to underpin it all on the gravel stratum, 20 ft. or 24 ft. down. This was so gigantic an undertaking, involving among other things taking down and reconstructing the chancery, that I naturally sought an alternative. It seemed to me that the great piers of the interior must, in the course of more than 800 years, have compressed the peat to the utmost, provided lateral expansion were prevented, and that consequently if the outer walls were underpinned down to the gravel, and the interior soil confined, this result might be obtained. It was obvious that the outer walls, at all events, must be underpinned at once to prevent their falling, whether the interior were dealt with or not. And it was decided to leave further work to the interior to be undertaken hereafter should it prove necessary, which there was good reason to hope would not be the case.

On this principle the repairs have been conducted, and the underpinning has been confined to the outer walls. Experience alone can show whether what we have done is sufficient, but from accurate observations that have been made, and regularly continued up to the present time, there is good reason to believe that the main fabric is now stable, and that the principle on which we have worked is just.

The most hazardous part of the operations has naturally been the south transept. To underpin so vast a wall, 120 ft. high and nearly 4 ft. 6 in. out of the upright, required some courage. It has, however, been done; the lower part has been strengthened by bringing it forward with large buttresses, and the whole is strongly chained back to the side walls with iron ties. The shoring was slackened last August, and, as no movement has been detected, it is now being removed.

Of other work, the groining of De Lucy's Presbytery has been partly reconstructed and partly repaired; the flying buttresses of the choir have been reset, and those of the nave aisles repaired; the groining of the crypts has been grouted and made good, and some of the columns have been taken out and re-fixed on new foundations. The cracks of the main walls, of which there were more than 100 in all parts of the building, have been bonded with hard stone and grouted full of liquid cement with the Greathead grouting machine, which has been of the most valuable service. The tower has been strapped together with iron. The west end has been repaired and the pinnacles restored, but the foundations of this part have not been touched.

The south nave wall, which was actually in movement towards a fall, has been secured by buttresses, which are arched over an inner walk along the south side of the church; and these are the only evidences above ground of all that has been done to secure the building.

The work now approaching an end has been one of unusual difficulty, and has made constant demands upon one's invention and resources. We might, as I have shown, have done more; I am sure we could not have done less. I was strongly urged by more than one adviser to take down and rebuild the south side of De Lucy's work and the great south gable of the transept. It seemed to me that it was better to preserve them if it were possible, and they are therefore still standing, and I trust will stand for many generations.

At various stages of the work I have been able to avail myself of Mr. Fox's advice on points that belonged more especially to engineering than architecture, and I am under great obligations to him for his assistance. He has already sent you an independent report on the result of our operations.

I must not conclude this account without mentioning the debt we owe to the diver, Mr. Walker, to whose careful work—which admitted of no regular supervision—our success is so largely due.

In Messrs. Thompson, of Peterborough, we have had contractors whose experience in dealing with work of this kind has been invaluable, and we are also indebted to Mr. Long, the clerk of works, and to Mr. Ferrar, the builder's foreman, for constant and careful supervision of the operations.

I am, dear Mr. Dean,

Yours very truly,

(Signed) THOS. G. JACKSON, R.A.

BRITISH ARCHÆOLOGICAL ASSOCIATION: CONGRESS AT GLOUCESTER.

(Concluded from page 5.)

Historic Gloucester.

Mr. F. A. HYETT, who is the author of a book on "Gloucester in National History," then contributed a paper on the history of the city, recalling its many associations with our national annals from Roman times onwards. Much information was compressed in a short compass, and a specially interesting section of the paper was the account of the famous siege and the eventual career of Edward Massey, who was governor of the city during that period of storm and stress.

The Town Clerk, Mr. G. Sheffield Blakeway, explained the chief points of interest connected with the Corporation insignia, Charters, and other records.

Tuesday, June 25.

In the morning some of the interesting churches of the city were visited. First the antiquaries inspected the little church of St. Mary Magdalene, Wotton, which was described by the Rev. Canon Bartleet. Only the chancel remains. By an act of vandalism the Charity Trustees of Gloucester in 1861 pulled down the nave of the church, but the beautiful west doorway was preserved and built up inside the chancel arch. The church was connected with the Hospital of St. Mary Magdalene, which was a leper hospital, and in the XIIIth century belonged to the Priory of Llanthony. The church, in spite of the rude treatment it has received, shows some fine Norman work. Two windows were inserted in the time of Edward IV.; there are the remains of a mural painting representing Our Lord, and there is a small stone effigy of a young maid of the date 1290. This was described by Miss Roper, who has made a special study of monumental effigies. The figure shows flowing ringlets bound by a fillet, and is clad in a simple costume, a long gown flowing down gracefully. She wears a narrow necklet, and has at her feet a lion or a dog. It is said that the figure was brought from the Hospital of St. Kineburgh. Some rude carvings on the exterior wall seem to represent the Star of the Epiphany, the Fleur-de-lis of the Blessed Virgin, and other devices supposed to be mementoes of pilgrimage.

Our space will scarcely permit of a detailed account of all the churches and other objects inspected by the members. The church of St. Nicholas, described by Canon Bazley, the municipal church, is full of interest. It is a XIIIth-century church attached to the Hospital of St. Bartholomew, with Early English, Decorated, and Perpendicular additions. Its quadruple squint is remarkable; its spire has been shorn of its upper portion. On the tympanum of the South doorway is the Agnus Dei with cruciform nimbus, supporting the cross and banner on the left forefoot. The so-called "sanctuary" knocker is remarkable, showing a demon carrying off an intemperate woman, who tries to touch with her tongue a bunch of luscious grapes. The Church of St. Mary le Crypt and the ruined priory of St. Oswald, which requires immediate attention, as the arcade shows signs of collapse, were also visited, and some members of the party inspected the remains of the Blackfriars' house amidst the soda-water bottles of Messrs. Talbot, and the Roman wall amongst Messrs. Bolla's printing-presses.

In the afternoon we drove in brakes up the steep incline of the Cotswolds through Birdlip to the interesting church of Elkstone, a very remarkable building of Norman date. The tympanum surrounded by the zigzag and pellet ornament shows Our Lord in Majesty with evangelistic emblems. There is a curious columbarium above the chancel. Amid torrents of rain the party drove to Pricknash Park, formerly the country seat of the Abbots of Gloucester, where they were hospitably entertained by Mr. Dyer-Edwards. In the evening the Bishop of Gloucester and Mrs. Gibson gave a reception at the Palace.

Wednesday, June 26.

The Severn Valley was traversed on this day. Two of the shire's famous castles were visited.

* A full description of this and other Norman doorways in the county is given by Mr. Keyser in "The Memorials of Old Gloucestershire," edited by Rev. P. H. Ditchfield (G. Allen & Co.).

By the kind permission of Lord Fitzhardinge we were allowed to see Berkeley Castle under the guidance of Canon Bazeley, the shell keep, the baronial hall, the room in which Edward II. is supposed to have been murdered, the prison with its oubliette, where a huge fat toad is said to have fed on the unfortunate prisoners, the chapel, historic documents in admirable preservation, and the pictures, all affording much interest. The historic old church of Berkeley, one of the finest in the county, was next visited, and we read again the lines on the tombstone of Dicky Pearse:—

"Here lies the Earl of Suffolk's fool;
Men called him Dicky Pearse,
His folly serv'd to make folks laugh,
His wit and mirth were scarce.
Poor Dick, alas! is dead and gone,
What signifies to see?
Dickys enough are still behind
To laugh at by-and-by."

Buried 18th June, 1728, aged 63 years."

After lunch at the Berkeley Arms Hotel we set out for Thornbury *via* Hill and Rock-hampton. Thornbury Church belongs to the early XIIIth-century period, with a decorated chancel built by Fitzhardinge of Berkeley in 1350. The tower is a very beautiful example of early XVth-century work, and was restored in 1843. The Castle was inspected by the kind invitation of Sir Stafford and Lady Howard, and in their absence their daughter, Miss Alice Howard, welcomed the party, entertained them to tea, and conducted them through the building. In the evening Mr. F. W. Waller, F.R.S., B.A., read a valuable paper at the Guildhall on the "Tower of Gloucester Cathedral," illustrated by lantern slides. It is hoped that this will be published in *extenso*. It revealed the alarming responsibilities of a cathedral architect who has the care of such an important structure. The tower rests upon somewhat slender piers, which have to support an enormous weight, and the strain is aggravated by the great pressure of the wind. The thinness of the walls of the upper part is noticeable, and the ingenious manner in which Mr. Waller constructed his scaffolding for the work of restoration, resting the weight on the lower and more substantial portion of the tower, is an achievement which fills with wonder the lay mind.

Thursday, June 27.

Deerhurst and Tewkesbury were the places visited on this day, and these were reached in a pleasant mode by travelling in the *River Queen* steamboat along the Severn River. Deerhurst was the first stopping-place, where the vicar, the Rev. E. C. Parmenter, met the party, and the church was described by Canon Bazeley. With the exception of the Saxon church at Bradford-on-Avon, Deerhurst is perhaps the most important specimen of Saxon architecture in the kingdom. It has often been described, and will be well known to the readers of the *Builder*. The font is especially noticeable, and was described by Mr. Ditchfield. It had been ejected from the church at some unknown period. The upper portion was discovered by Bishop Wilberforce in 1845 and placed in Longdon Church. Miss Strickland, of Apperley Court, found the lower portion and succeeded in gaining both parts for the church. Professor Westwood considered that the spiral ornament was the most characteristic of all Celtic patterns, and the Bishop of Bristol pronounces it to be unmistakable Irish work combined with elegant classical Arabesque.* The neighbouring farmhouse contains remains of the old priory buildings. The Saxon Chapel of Odia was then visited, which was only discovered in 1885. Many pages would be required for a full description of this important early building.

At Tewkesbury the antiquarians were welcomed by the Mayor and Mayoress, Canon and Mrs. Wardell-Yerburgh, and other chief residents of the town, and lunched at the Swan Hotel. They then adjourned to the Abbey. Tewkesbury Abbey has so often been described that it is not necessary to record here its beauties and attractions, which were ably pointed out by the vicar and the sacristan, Mr. Bannister. The old town is remarkable for its number of beautiful specimens of half-timber houses, several of which were visited under the guidance of Mr. Godfrey. After tea at the vicarage we walked along the "bloody lane," the site of the Battle of Tewkesbury, concerning which Canon Bazeley has written learnedly, after much

* A full description of this font and of other fonts in the county is given by Dr. Fryer in the "Memorials of Old Gloucestershire." (G. Allen & Co.)

careful study of the scene of the engagement, and then from the Lower Lode steamed back to Gloucester.

The evening was profitably spent at the Museum, where Canon Bazeley lectured on some Roman inscribed tiles found during the excavations at Hucclecote, which disclosed the civilian character of Roman rule at Gloucester, and clearly established what was never surely known before. Mr. Payne exhibited some remains found in the Bown Hill Long Barrow and in the Bisley Long Barrow; and the President, Mr. Keyser, gave a short address on the mural paintings in Gloucestershire, on which subject he is one of our chief authorities.

Friday, June 28.

Bishop's Cleeve was the first place visited on Friday, which possesses a beautiful church. There was formerly here a priory founded by King Arthur of Mercia, in 790. The west and south doorways are Norman. The chancel was rebuilt in the XIVth century. The President pointed out the similarity between this and Bredon Church. There are some interesting monuments, including that of a knight, cross-legged, under a canopy with ball-flower ornament. It is supposed to be a memorial of one of the De Bohun family. We were then driven to Hayles Abbey, the history of which has been admirably written by Mr. St. Clair Baddeley. Excavations conducted by the local society have revealed the plan of this much despoiled Cistercian abbey, and the little museum contains some remarkably fine bones and tiles.

Winchcombe, once the proud capital of Mercia, was next visited, and lunch was served in the George Inn, which was an old pilgrims' hostel, and has a gallery yard. The church is a splendid Perpendicular building erected by the last Abbot of Winchcombe, and contains many features of interest. Then a short walk brought us to the gates of Sudley Castle, redolent with the memories of Queen Catherine Parr and her second husband, Lord Seymour of Sudley, and the young Princess Elizabeth, who was sent away from the Castle because of her "unseemly romping" with my Lord of Sudley. Many notable families have been connected with the Castle, and many royal visitors entertained there. The late Mrs. Dent wrote an admirable monograph on its history, and that lady and her husband did much to restore the Castle to its former splendour.

In the evening Mr. W. H. Bruton gave a reception at Bewick House and exhibited his fine collection of mezzotint engravings after Rembrandt.

Saturday, June 29.

The work of the Congress was brought to a conclusion, but before dispersing the members visited the interesting church of Bredon, a full account of which has appeared in the *Journal* of the Association, written by the President, and also the churches of Overbury and Beauford, which were described by Mr. Keyser. Heartfelt thanks were given to him for all his labours in connexion with the Congress, which owes its success mainly to him, and also to Canon Bazeley, who accompanied all the excursions, and gave us the benefit of his intimate knowledge of the antiquities of the shire, and to the Hon. Secretary, Mr. Austin, who, with much tact, energy, and skill, so ably carried out the arrangements.

The Association will retain many pleasant recollections of Gloucester and of the kindness and hospitality its members received, and we trust that somewhat less a period than sixty-six years will elapse before it again visits the city of the West.

P. H. D.

OXY-ACETYLENE WELDING.

TUBAL CAIN would probably have been incredulous if some Mother Shipton of his time had prophesied the execution of welding without the aid of hammer or anvil. And in times nearer to our own the welding of cast-iron was quite outside the range of ordinary practice. But at a demonstration of Oxy-acetylene Welding and Cutting, held at the Northern Polytechnic on Friday last, under the auspices of the British Acetylene and Welding Association, the operation of welding by means of the oxy-acetylene blowpipe was performed upon mild steel, wrought-iron, brass and copper; and a large number of exhibits of work—much of it impossible of equally good execution by other methods—was submitted to an interested audience.

Among engineers this method of weld has become fairly familiar, but the supply workmen capable of handling it is found to be quite inadequate.

A course of instruction has therefore been arranged at the Northern Polytechnic, and it is already found that the students are eager sought after by employers so soon as proficiency has been attained.

The process is not quite that which is ordinarily associated with the word "welding," which implies the joining of two pieces of metal by pressing or beating them into actual contact with one another at a suitable temperature. It is nearer akin to soldering or brazing, but with the vital difference that the metal inserted between the pieces to be joined is practically the same as the metal to be joined, thus in welding wrought-iron, mild steel, brass or copper, rods of the same material are used. For cast-iron, ferro-silicon forms the filling.

For mild steel and wrought-iron no flux is required, but for cast-iron, cast-steel, copper, bronze, brass and aluminium it is necessary to use "welding powders" to eliminate the metallic oxides formed when the metal is in a molten state.* The composition of the fluxes varies. For example, borax is often used with brass, preferably in lump form, its purity is then more to be relied upon. For cast-iron one of the fluxes used consists chiefly of manganese, chlorate of potash, and borax.

The danger of "burning" the metal, familiar to the blacksmith, is reduced in the oxy-acetylene method by a careful regulation of the proportions of the two gases forming the jet. There is no difficulty in this, as the mixture is, by means of a tap on the blowpipe, quite under the control of the workman, who can judge it by a glance at the flame. The proportions in practice are about two parts oxygen to one of acetylene.

The relative strength of an oxy-acetylene weld in mild steel when compared with that of the original metal has been shown by tests to be from 87 to 92 per cent., in some cases even 95 per cent., results superior to those obtained from ordinary welding.

The mechanical preparations for the actual welding are simple. If, for instance, a metal plate is to be joined by its edge to a similar plate lying in the same plane, the edges of the two pieces are splayed down on each side to a rough knife edge, the splay being about equal to the thickness of the plate. The joint is then filled with the filling-metal, the latter being used in a stick, like a stick solder, and the general effect of the process being somewhat similar.

A weld in a piece of ordinary 3-in. iron plate was roughly tested by gripping the plate in a vice and bending it by hammering. When bent parallel to the weld it broke through the untouched plate—the weld remaining intact. When broken at right angles to the weld it was the weld itself that offered the greatest resistance. In this case the superior quality of the inserted welding material made the joint easily the strongest part of the whole.

Welds have been made by this method of metal measuring 9 in. by $\frac{1}{2}$ in. in section area, and by its work such as boiler repairing *in situ* and many other operations in place difficult of access can be accomplished.

Another sphere of usefulness is found for the oxy-acetylene blowpipe in the cutting of pieces of such things as boilers and girders. A special jet, in effect the ordinary inject type of blowpipe, with an additional annular nozzle through which an extra supply of oxygen is delivered, is used for this purpose, and on Friday's demonstration Mr. William Kemper, the instructor, cut plate-iron $\frac{1}{2}$ in. thick at the rate of 1 in. run in ten to twelve seconds. This application of the process has been found useful in removing large boilers from the basements of buildings, in cases where boiler removal was impossible and the noise of hammer and chisel would have been intolerable.

MEMORIAL HOSPITAL, HAYWARD'S HEATH.

Messrs. Wheeler & Godman, of Horsham, are the architects for the King Edward Memorial Hospital, which was opened last week at Hayward's Heath by H.R.H. Princess Christian. The building consists of a central block with two projecting wings, and the wards are on the ground floor, the upper floor being devoted to the staff. The building was Mr. Horace Finch, of Hayward's Heath.

THE ARCHITECTURAL ASSOCIATION: WEEK-END VISIT TO LIVERPOOL, JULY 5-7.

MANY reasons combined to make an A.A. visit to Liverpool desirable. Strongest attraction must be placed the new cathedral, such a building being sufficiently common as alone to justify an excursion rather more than ordinary distance; second, many important commercial buildings of recent erection promised further interest; ally, the members of the Association have always entertained a friendly curiosity as to the doings of the Liverpool School of Architecture, and readily accepted the invitation tendered to them by Professor Reilly to visit the School while in Liverpool. Additional attractions held in reserve were the fine examples of the scholarly work of the early XIXth century Elmes and Cockerell.

Arriving from London on Friday evening, the first building visited was the Adelphi Hotel, where the party was located. Recent exhaustive descriptions which have appeared in the *Builder* make any further notes on Mr. Atkinson's fine scheme superfluous. When complete will be the finest hotel on this side of the Atlantic. On Saturday morning the party, joined by members of the Irish Association, under the conduct of various members of the Liverpool Architectural Society got to work early.

Risking subsequent anti-climax, the first building visited was St. George's Hall. It is in the day to add anything to the encomiums which have been showered upon this magnificent building, while any criticism can only be uttered at the roof conception of architecture which would produce it. Allowing its designer's aims and ideals to be right ones, of itself it is almost perfect, but it is difficult to understand the attitude of mind which expresses surprise that it should have been produced by so young a man. One feels that under English conditions it must have been done by a man young in years and practice, or not at all; the fortunate fact is that with a spirit enthusiastic enough to form so large a conception was united a head capable of working out such grand ideas hardly a false note. The building is, of course, favoured by its position—it is one of the few great city buildings in England that is possible to see as it should be seen. The use of the great open place, free from traffic, is hardly to be over-estimated.

The interior of the great hall, though grand, rises to the level of the exterior. The design given by the granite columns is rather related by the uneasy division of the structure into them into three nearly equal parts by gallery fronts and impostas. There is, however, an air of mid-Victorian taste about the finishings which conflicts with the large manner of the general conception. Despite Cockerell's great reputation and Elmes's pressed wish that he should complete the scheme one feels that it could have been better. The small concert hall, by the same hand, is much more successful, and the east tribune is entirely charming. The vexed position of the threatened podium at the west end was, of course, debated, the consensus of opinion being that the wise course is to refrain from disturbing the present arrangement. After studying the exterior from all points a short visit was next paid to the portico Theatre, originally a music-hall, but converted by Professor Adshad with some amount of alteration, including the formation of a foyer out of an old beer cellar. An empty theatre by day is inclined to be dismal, and the party showed little disposition to linger, specially in view of the full programme ahead them. With the next building—the Cotton Exchange, by Messrs. Matear & Simon—commenced a round of the important modern commercial buildings. A detailed description will be prefaced by a few general remarks. These buildings which are of a public or semi-public character bear the stamp which distinguishes so much modern competition work all over the country—good planning combined with a rather strained cleverness in rational treatment. Hasty design seems separable from modern commercialism, and thereby pays the penalty through many long years. There is probably no single building of series visited which fully satisfies its authors, which would not have been improved by a

longer period of study. Each professedly adheres to the Renaissance—most to a pretty free rendering of it—yet it is where least renaissance that the work is most successful. The Cotton Exchange is a fine building excellently laid out to serve its purpose. The screen front and portico facing west are boldly conceived and well carried out, though a few grammatical difficulties of the style have hardly been conquered; but the essentially rational and modern north front will probably prove of more enduring interest and value as a contribution to the progress of architectural style. The building was erected in 1906 for the Liverpool Cotton Association, Ltd., whose members originally transacted their business on the Exchange flags. The chief part of the new Exchange is occupied by the hall, 140 ft. by 128 ft., extending to the top of the building, and galleries on all four sides. The galleries are supported by polished monolithic columns of Royal Blue granite of the Doric Order, above which an upper tier of Ionic columns of similar material supports a bold ceiling cove and glazed roof. The corners of the rectangle are splayed internally, and give place for effectively-designed fireplaces. Other fine apartments are the Board room, panelled in English wainscot with a chimney-piece of Mazzano marble, and the members' reading-room, panelled in Italian walnut and having a plaster barrel ceiling. Business was in full swing, and considerable interest was taken in its conduct, which could be well observed from the gallery.

After leaving the Cotton Exchange the party reached next the Town Hall, built by Wood, of Bath, in 1748, but since extensively altered and remodelled, first by James Wyatt, and more recently by other hands. Its chief note of interest lies in the splendid suite of rooms on the first floor, which have largely preserved their original character. Contrasting sharply with these rooms is the Council chamber, the authorship of which was not disclosed. The entrance hall, decorated by Professor F. M. Simpson, is dignified in its general effect. The pendentives of the lofty dome which surmounts the staircase have been finely painted by Mr. Furse.

A rapid tour was next made of Castle-street and James-street, passing on the way several notable buildings. Parr's Bank, by Mr. Norman Shaw, with Messrs. Willink & Thicknesse, displays the hand of the master. Its daring colour scheme of granite, pavonazzo marble with bands of green cipollino, red terracotta dressings, and green slate roof "sounds doubtful with a dash of distrust in it," as Mr. Halsey Ricardo wrote when it was built, but the result is a fine and distinctive building. As an interior the circular banking hall, attained by a daring constructive expedient, is architecturally less successful, the dome ceiling seeming too low in pitch and the cornice unrelated. Nearly opposite is the Bank of England, Cockerell's finest design—bold, forcible yet restrained, conveying admirably that expression of reserve appropriate to a bank. Mr. Norman Shaw's hand is again visible in the White Star Offices, built in collaboration with Mr. J. Francis Doyle. The general scheme of this building is reminiscent of New Scotland-yard, the high granite base, banded brick and stone walling above, and the angle turrets are all present, and there are other points of resemblance. The small Ruabon bricks used do not give so good an effect as the sand-faced bricks of the London building, and their harshness rather mars a powerful and fine design.

The next group of buildings seen were those constructed on the site of the old St. George's Dock, purchased from the Mersey Dock and Harbour Board by the Corporation some years ago. A magnificent site was thus created, and it is a matter for great regret that uncontrolled development was allowed. Two buildings at present occupy the extremities of the site, the centre being vacant; but whatever is introduced between the effect must be discordant, though each, in its way, has considerable merit. The Dock Board offices have a splendid plan, its diagonal corridors converging on a central hall surmounted by a lofty dome, and, with galleries at each floor level, allows the full extent of the building to be grasped in a way unusual in a purely office block. The architects, Messrs. Briggs, Volstenholme, P. B. Hobbs, and Arnold Thornely, are to be congratulated on having produced a stately design, but its period of domination has been terminated by the recent erection of the Royal Liver Building, on so vast a scale that for the present it dwarfs the

city. This gigantic building—ten stories high in the main block with lofty towers at either end—was designed by Mr. Aubrey Thomas, who has handled the problem in a manner both strange and striking, but coming astonishingly near to brilliant success. Structurally, the building is interesting as an example of skeleton construction in reinforced concrete faced with dressed granite. The equipment is also extremely modern and complete.

On their way back to their hotel the party visited the fine Royal Insurance building in Dale-street, but were unfortunate in missing Mr. Francis Doyle owing to loss of time in fulfilling their extensive programme. They were, however, able to inspect the interior of the building, which contains a Board room certainly not inferior to any room in Liverpool. The exterior of the offices is a strong design, free from fuss or confusion, and satisfactory in all respects save the widely-spaced order unnecessarily introduced on the second and third stories.

The early part of the afternoon was devoted to the cathedral; Mr. Gilbert Scott kindly attended and explained the intention of his design. It is not too much to say that the first disclosure of this at the time of the competition produced among architects a real sensation, as much by its bold and unforced originality as by its skilful seizure of the opportunities of the site. It has undergone many changes since, and doubts have been expressed whether all are improvements, but the first completed portion of the work is an excellent augury for the ultimate success of the whole, and inspires great confidence in Mr. Scott's ability to achieve it. In the interior of the Lady Chapel the organic constructive scheme, fine proportion, carefully regulated lighting, well-designed glass, good texture of carving, stonework, and oak combine in an effect which is at once vital and devotional. The lines lead the eye eastward and upward. Externally, too, the delicacy of this chapel serves as a foil and gives scale to the great mass of the choir. Good progress is being made with this, the high vault being in course of construction. Westward a great deal remains to be done, the big central area obtained by the sacrifice of the transeptal towers having been for the present deferred. One is disposed to regret these towers, which showed so finely on the drawings and model, but Mr. Scott knows quite well what he is about. A number of drawings were on view, and no effort was spared to make the visit thoroughly enjoyable. After the cathedral the recent additions to the School of Art, by Messrs. Willink & Thicknesse, were visited, the architects kindly attending. The new work is refined in character, architectural features having intentionally and wisely been suppressed or reduced to their simplest form to enhance the appearance of the casts and models housed. The sculpture court, with simple arcaded galleries, is particularly successful, bearing in mind its purpose. From here the party proceeded to the Students' Union, by Professor Reilly. The completed portion is full of character and pleasing in colour. This is due to the brickwork of the upper portion of the front, where Professor Reilly has used thin bricks wire-cut on the face instead of on bed, as commonly done in America. The effect is entirely to alter the colour and texture of the clay, which in the local common brick is apt to be unpleasant. The stone detail of the lower portion of the front is hardly so successful as the work above, an imperfect realisation of scale being apparently responsible for its crowded effect. The two chief rooms, which extend the full length of the front on the ground and first floors, are quiet and suitable. Professor Reilly, who had been with the party throughout, next accompanied them to the School of Architecture, now occupying the old Bluecoat School, saved and presented for the purpose by Sir W. H. Lever. Tea was here partaken of by kind invitation, and an exhibition of students' work, which was fortunately on show, was examined with great interest. A.A. members have their own views as to architectural education. Some excellently rendered elevations were to be seen, and the designs generally, albeit in rather a narrow groove, were creditable to both authors and instructors. Subjects of a monumental character—architectural scene-painting, if one may so call it without offence—were the order of the day, and the results in this sphere were much superior to the comparatively few essays in everyday design. It would have been

interesting to see plans more frequently, and very few adequate perspective drawings were shown; but the exhibition, taken altogether, is an imposing one. In the evening the party was entertained at supper at the Victoria Club by the hospitality of the Liverpool Architectural Society.

On Sunday morning little definite sightseeing was attempted, but many members visited Messrs. Austin & Paley's grand church at Mossley Hill; St. Agnes, a characteristic work of the late J. L. Pearson; and St. Clare, in which Mr. Leonard Stokes in an inexpensive church achieved one of his finest exteriors and showed the native architects how their common brick should be used effectively. The party returned to town in the afternoon after a most successful week-end. To the members of the Liverpool Architectural Society and Professor Reilly is due the gratitude of the members for liberal hospitality and help.

ARCHITECTURAL SOCIETIES.

Bristol Society of Architects.

The annual excursion of the Bristol Society of Architects took place recently to Malmesbury, Cirencester, and neighbourhood. The party comprised Mr. J. Foster Wood, F.R.I.B.A. (President), Mr. G. H. Oatley, F.R.I.B.A. (President-elect), Messrs. Mowbray A. Green, F.R.I.B.A., G. C. Awdry, F.R.I.B.A., Austin B. Botterill, A.R.I.B.A. (Hon. Treasurer), B. F. G. Wakefield, Lic.R.I.B.A., A. E. Gough, A.R.I.B.A., C. H. White, A.R.I.B.A., H. J. Cavell, T. H. Skinner, C. G. Skinner, R. A. Duncan, W. H. Price, the Rev. R. C. Cole, M.A., and Mr. John Fisher (guests), and Mr. C. F. W. Denning, Lic.R.I.B.A. (Hon. Secretary). Leaving Bristol by car, the first stop was at Cold Ashton, where, by permission of Mr. A. T. Crew, the Manor House was viewed. At Malmesbury the members were received at the Abbey by the Rev. Charles D. H. McMillan, M.A., and under the guidance of Mr. Harold Brakspear, F.S.A., A.R.I.B.A., the building and the Abbey House were inspected. Continuing the journey to Cirencester the party lunched at the King's Head Hotel. At the conclusion the President, Mr. J. Foster Wood, referred to the honour recently bestowed by his Majesty King George V. upon a member of the society, and a letter of congratulation and expressive of the valuable services rendered to and the interest taken in the society during many years, formerly as President and later as member of the Council, was signed by the members present and dispatched to Sir Frank W. Willis.

The party then adjourned to view the parish church, where they were received by the Vicar, the Rev. W. A. Robins, M.A., and under the guidance of Mr. E. C. Sewell (local Hon. Secretary of the Bristol and Gloucestershire Archaeological Society) this interesting building was inspected. By permission of Captain J. Gordon Dugdale, D.S.O., the members walked through the Abbey grounds to inspect the Roman capital and ancient gateway, the only remains of the Abbey. Thence by St. John's (The Pan) Hospital and St. Thomas's Hospital to the Cornium Museum of Roman Antiquities. Mr. Sewell, who accompanied the members, read some notes and gave some valuable information.

Unfortunately the weather was somewhat inclement when a start was made for Minchinhampton, where a stop was made to see the church, and the Rev. J. F. O. Lewis read some notes on the building, the principal feature of interest being the south transept with its stone roof. From Minchinhampton the route was through Nailsworth to Uley. The intention was to have visited the Tumulus and walk to the great camp at Uley Bury, but as the weather would not permit of this being accomplished the journey was continued to Owlpen Old Manor. The delightful old house and grounds and the church—recently restored by Mrs. Trent-Stoughton—were inspected.

Nottingham Architectural Society.

The members were favoured with fine weather for their visit to Cheshire on Thursday last. The party of twenty-four members and friends included the President, Mr. E. R. Sutton; the Vice-President, Mr. H. Gill; Messrs. W. V. Betts, R. Evans, F. W. Gregory, W. R. Gleave, E. H. and A. E. Heazell, Arthur Marshall, W. Pare, A. W. Shelton, and the Hon. Secretary, F. M. Royle.

Moreton Old Hall was the first place visited. This is one of the finest remaining half-timbered manor-houses of the Tudor period. Situated in the midst of verdant meadows, with its projecting upper stories, gabled roofs, and ivy-clad chimneys, it is the delight of artists from all over the world. The interior, with its carved oak beams, panelled ceilings, walls, and massive carved fireplaces, is no less interesting, and the old furniture in the rooms is most carefully preserved. This old mansion is greatly prized and cared for by the present caretaker, Mrs. Dale, one of whose ancestors was the "Rychard Dale carpenter" whose name is recorded on one of the bay windows. Miss Moreton, the last of the Moreton family, died recently at the age of ninety-two, and the property now passes to Bishop Abraham, of Derby.

Astbury Church was then inspected. The earliest portion of this dates back to the XIIIth century. Among many interesting features is a priest's chamber over the south porch, with a small stone window looking from it into the church. The altar-rail, font cover, rood-screen, and pew doors are fine examples of Jacobean carved oak work. Astbury was originally the parish church of Congleton, and a pew is still reserved for the Mayor and Corporation of this latter town.

Lunch was taken at the Lion and Swan Hotel at Congleton, which dates back to the XVIth century and is filled with a unique collection of antique furniture, pottery, pewter, and brasswork collected by the present proprietor.

The church at Marlon was the next call. This is a pretty half-timbered church, and Lower dating from the XIVth century. Through the courtesy of the Vicar, the earliest register on vellum, dating from 1558, was on view.

Siddington Church was also visited. This is a similar example of black-and-white construction, of which the chancel, porch, and roof of the nave are the original XVth-century work.

The last church inspected was Gawsworth, a stone building containing many beautiful alabaster monuments of the Fytton family. A long stretch of water in front covered with water-lilies and a delightful old half-timbered rectory facing the church make the situation an ideal one. Although the distance covered was nearly 50 miles, the motor-cars brought the party back to Stoke in time for dinner.

ARCHÆOLOGICAL SOCIETIES.

Surrey Archaeological Society.

The annual excursion of this Society for the current year is announced to take place on Thursday, July 18, and the places to be visited are Chertsey, Thorpe, and Egham. Londoners will start from Waterloo terminus at 10.25 a.m. and arrive at Chertsey at 11.54. Chertsey Church will be first visited and described by Mr. P. M. Johnston, F.S.A., architect. The members will then proceed to view the remains of the Abbey Mill and the fishponds of the Abbey, which will be inspected by the kind permission of the owner of the site, and will be described by Mr. H. E. Malden, M.A. Thorpe Church will be next visited, and described by Mr. P. M. Johnston. A short visit will then be made to Thorpe Manor House, the carriages then leaving Thorpe for Great Fosters. There the great Tudor house, one of the finest in this part of England, will be inspected by the kind permission of the Right Hon. Lord Dudley. An historical account will be given by Mr. F. Turner, and notes upon the architecture by Mr. Ralph Nevill, F.S.A., architect. Carriages will leave here for Milton Park, Egham, the residence of the Baron De Worms, F.S.A., by whose kindness the party will be permitted to inspect some curious stone doorways in the garden. To those of our readers who contemplate attending this excursion we would mention that an excellent paper by the late Major Heales, F.S.A., will be found on "Chertsey Tiles," with illustrations, published in the seventh volume of this Society's *Transactions*.

CHURCH HALL, FINCHLEY.

The estimated cost of the erection of Holy Trinity Parish Hall is £3,000., and plans for the building have been prepared by Mr. J. C. Stockdale, Lic.R.I.B.A., architect, of Bloomsbury, W.C.

GENERAL NEWS.

The University of Liverpool.

The following awards are announced in School of Architecture:—Degree of B.A. Second Exam.: S. H. Lakshminaras. A. R. Sykes. Certificate in Architecture: First Class (exempting from the Intermediate Examination of the Royal Institute of British Architects): R. F. Dodd, S. A. Harper, S. Jones, S. H. Lakshminarasappa, A. R. Syl W. H. Thompson. Second Class: S. Farad G. N. Hill, S. P. Mahin, J. W. Rutledge. Following scholarships have also been awarded: The Holt Travelling Scholarship, W. Thompson; the Ravenhead Entrance Scholarship, F. Jenkins.

The R.I.B.A. Board of Architectural Education.

The Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by following students, who are qualifying for Final Examination, have been approved:—*Subject III. (a)*—Messrs. R. A. Bar E. F. Bothwell, H. C. Bradshaw, R. S. Dix H. A. Dod, E. Gee, and T. C. Lawrence. *Subject III. (b)*—Messrs. H. Lidbetter, Prestwich, W. H. Thompson, R. A. Walter, W. E. Woodin.

The Federal Capital of Australia.

For some time a large gang of workmen have been engaged on the site of the future Australian Federal Capital City at Canberra, in making necessary roads. These are now in thorough order for the commencement of work on the city itself. Surveys for various purposes are proceeding. One party is engaged on location of a railway line from Canberra to Jervis Bay, where the Royal Australian Naval College will be established. Other parties are engaged on the determination of boundaries of holdings and on surveys connected with such engineering propositions as road deviations and tramways. A staff of draughtsmen is compiling plans as a result of the surveys. The Minister for Home Affairs stated recently that probably ten years will pass before the Federal Parliament would sit in the city. The Federal territory watered by four rivers, the supply from which will be kept separate and used for such different purposes as drinking supply, ornamental water, and utility services.

Office of Works Contracts.

Mr. Pointer acting in the House of Commons recently what steps are taken by the Office of Works to secure that all work done by contractors, especially work that can be easily examined when a job is completed has been properly and efficiently executed according to the contract.

Mr. Benn replied that clerks of works appointed to see that all work is properly and efficiently executed, while, in addition, building inspector pays surprise visits while the work is in progress. The architects charge exercise general supervision over building works. The Board's contracts provide that builders shall give notice to the architect or clerk of works when it is their intention to cover up any portion of the work, and if the work is so covered up or hidden without written authority the builders may be required to uncover the same at their own expense.

Plans for Workmen's Houses.

Sir Arthur Markham asked the representative in the House of Commons of the First Commissioner of Works whether, seeing that under the Housing of the Working Classes Act 1890, plans of dwelling-houses have to be approved by his department before a loan sanctioned, he will say why his department require four complete sets of drawings of every general plan, four sets of plans of the house and the elevations of the said houses, and if sets of drainage plans, water plans, of whether he is aware that city councils or other public bodies charged with the business only require one complete set of plans whether a complete set of plans in duplicate would be sufficient for the purpose of his department; will he say what is done with all numerous plans, and if the designs are treated as confidential within the department.

Mr. Wedgwood Benn, in reply, says he understands that two sets of plans are asked for

Public Works Loan Board. Only one set forwarded to the Office of Works. The plans are treated as confidential within the Department.

Doncaster Housing Scheme.

In answer to a question by Mr. Jowett, John Burns states that the Doncaster Corporation has submitted an amended housing scheme for Doncaster, which includes the provision of thirty-six separate dwellings, in ten houses, being two separate dwellings in each house, with a view to the same being let from 2s. 6d. to 4s. a week. He has approved the principle of erecting these dwellings, but has returned the plans to the Corporation for amendment in certain respects.

Town-Planning Scheme, Walthamstow.

The Walthamstow Urban Council have applied to the Local Government Board for permission to frame a scheme relating to an area of 1,534 acres lying for the most part to the north side of Forest-road; it is intended to devote as an open space in connexion with the scheme, about 100 acres of "amenity lands" upon the banks of the Lea. The scheme represents 1,600 acres within the Council's jurisdiction are built over, and provide housing for a population of 125,000.

The George Petrie Memorial, Dublin.

A meeting of the General Committee of the George Petrie Memorial was recently held at the rooms of the Royal Society of Antiquaries, 15, Green, Dublin, G. N. Count Plunkett, F.R.S., in the chair. It was decided to engage for a popular lecture, illustrated by lantern views, descriptive of the life and works of Mr. Petrie, and detailing his great services to Irish Archaeology, in particular in laying the foundations of our present knowledge of early Irish Architecture, to be held during the coming autumn. The Right Hon. M. F. Cox consented to deliver the lecture. It was decided to include in the scope of the project so as to include the erection of a bust and suitable inscription to the worthy monument in some public place, in addition to the erection of a monument over the grave. The following were appointed an Executive Committee to deal with the details:—G. N. Count Plunkett, F.R.S.; Sir Gabriel Stokes, K.C.S.I.; Sir Clifton Ball, Litt.D.; Dermot O'Brien, F.R.S.; R. M. Butler, F.R.I.B.A.; Robert Kane, LL.D., F.R.I.B.A.; the Right Hon. M. F. Cox, M.A.; Edwin Lloyd, P. J. Lynch, LL.B.; S. W. Maddock, Frank Stokes, and J. O'Reilly, F.R.S.A.I.

Extension of Municipal and County Engineers. The orphan fund of this Institution mentions their annual Report that, although no increase in the subscriptions could be shown for the past year, no serious diminution occurred, the amount subscribed being £68, as against £44. 1s. 9d. in 1910, while the number of subscribers had been three less. Grants made from this fund have rendered tribute to six widows of late members of the Institution towards the schooling and maintenance of their children.

Kingston Vale.

We regret to see from the report of the Executive Committee of the Wimbledon and Epsom Commons Extension Fund that much yet to be accomplished before their plans can be finally crowned with success. Kingston Vale is considered safe from the hands of the spoiler. It seems rather extraordinary that London as a whole does not seem to realise its responsibility in this matter. The City Corporation has made grant. The Surrey County Council has invited the proposal of its General Purposes Committee to subscribe £5,000, and even the Borough of Wandsworth, which is so immediately concerned, has acted in the same way. On the other hand, the Urban District Council of Malden and Combe has voted £3,000, the District Council of Merton £500, all which it is to be hoped the Local Government will sanction in due course, while the Borough of Wimbledon first voted £10,000, then determined to postpone its application to the Local Government Board for six months, during which time the options on the land will expire. The proposal of the London Traffic Board of the Board of Trade to create a main starting from Robin Hood Gate and running east to Malden by way of the valley of the Ottery Brook, introduces a new factor into

the problem, which will probably have some influence over the future development of the district. Although the proposals of the Extension Fund Committee are less ambitious, the ultimate achievement to be striven for is the preservation of the rural character of the whole of the Kingston Vale district, and this is a matter which seems to be of vital importance to the future of London.

"Bungalows and Country Residences."

An interesting event took place on Tuesday evening last, when Mr. R. A. Briggs entertained at dinner Mr. Herbert Batsford, Mr. Harry Batsford, Mr. Harry Browning (Mr. Briggs' partner), and several of the oldest members of Mr. Batsford's staff, to celebrate the twenty-first anniversary of the publication of his "Bungalows and Country Residences."

BOOKS.

Modern Practical Design. By G. WOOLLS-CROFT RHEAD. (London: Batsford. 1912. 7s. 6d. net.)

This book differs from the author's former work on "Principles of Design" in the following particulars:—(1) The last-named is confined to the elucidation of principles, while "Modern Practical Design" deals with the technique, tools, and practical methods relating both to design and craftsmanship; (2) the illustrations of the present book are, with one or two exceptions, representative examples of the work of modern craftsmen, instead of being, as in the "Principles," drawn chiefly from the art of the past. Design here is taken to mean the forms of "applied art" covered by the syllabuses of the Board of Education in elementary, advanced, and honours design. The book should, therefore, appeal to teachers, students, and craft-workers generally in its capacity as a practical guide to the preparation of designs for the various branches of art industry. The author is to be credited with considerable experience as a teacher, and we believe he has actually practised with conspicuous success many of the subjects dealt with. There are chapters on patterns for paper and fabrics, book-decoration in all its branches, pottery, stained-glass, metalwork and woodwork, dress embroidery, fans, lace, and posters—on all those phases of artistic activity, that is to say, which are included in the term "applied art." The whole is prefaced by a chapter on plant form as the basis of ornament, in the true South Kensington manner. There are 160 illustrations of considerable interest. But, as the author remarks in his introduction, "it will be obvious that in a work aiming at covering such a wide area little more than the mere fringe of the different subjects can be touched; it will be necessary for students to supplement their reading by reference to the monographs published on the different crafts which (the monographs, we take it) are well-known." That is just the trouble. Anyone wanting to know the sort of knowledge proffered would go to the more comprehensive work on the subject of his choice; whereas for anyone just vaguely and generally interested this book is probably not sufficiently illuminating.

In the sphere of decorative and applied art there is as good work being done to-day, with certain reservations, as was ever done in the past, and the standard of design, no less than the skill of the craftsman, is continually advancing. The book should prove stimulating to the student, and it cannot fail to interest all concerned with the decorative arts, though it may not be sufficiently exhaustive in the way it deals with any one craft to stand all the tests to which some of Mr. Rhead's confrères are sure to subject it.

The Great State. Essays on Construction by H. G. WELLS, CECIL CHESTERTON, ROGER FRY, and others, under the general editorship of H. G. WELLS. (Messrs. Harper & Brothers. 1912. 6s.)

MR. ROGER FRY is one among the several contributors of essays, to which Mr. Wells has added an Introduction and edited, under the title of "The Great State." These essays represent the hopes of science, of art, agriculture, the Church, the politician, and the intimate social relationships under reorganised social conditions. These conditions are only suggested. "Our conception of the Great State

is still altogether unsubstantial," Mr. Wells explains. We gather, however, that the basis is industrial and strenuous. We are not invited to cakes and ale, amid the perfume of hay and hedges that mark the millennium of William Morris. The days of such Utopian romance Mr. Wells declares to have passed. Robert Louis Stevenson defined romance as the "Poetry of Circumstance." In this sense Mr. Wells and his colleagues are eminently prose writers.

Those who speak of the part to be played by the science of the future have an especial advantage. The man of science can advance with comparative sureness. His premises remain unchanged whatever social gyrations may occur. The article by Mr. C. J. Bond on "Health and Healing in the Great State" is a satisfactory example. The premises of the artist are, at best, but an expression of his hopes and his fears for art. Mr. Fry commences with a survey of the artist's position. His earlier and aristocratic patron was not unsympathetic, if ignorant. The later plutocrat was both. "But both alike desire to buy something which is incommensurate with money. Both want art to be a background to their radiant self-consciousness. They want to buy beauty as they buy love, and the painter, picture-dealer, and the pander try perennially to persuade them that it is possible." At the present moment neither will buy anything without the "patine" of age; whether genuine or put on in Paris. Meanwhile, the artist starves. Are there conceivable conditions under which the artist will fare better? We gather that Mr. Fry thinks not. He seems to see the painter and the sculptor drawn into the ranks of artisan and craftsman, where they may assist in raising the level of trade design and earn a living thereat. He would put the painter on the same basis as the poet. The latter makes no pretence of living on his poetry, but in exceptional instances.

We do not see, however, why a changed social basis is necessary to effect this. Many men of ability already design for the trades. The horrible patterns and detail which Mr. Fry describes as surrounding him in the refreshment-room of a railway-station as he writes is conceivably due to the fact that there are not enough of these men possessing the requisite technical knowledge to go round. He also hopes that something might be the outcome from a resuscitation of the Mediaeval Guild. It might be so. Yet we have to admit that the very same forces that broke up the Guilds are as active to-day as formerly. "Nevertheless, in the long run," he concludes, "mankind will not allow this function which is necessary to his spiritual life to lapse entirely." There is something of despair in this. And when we read in another essay, "A portrait-painter or a poet who gave his whole time to painting or poetry would be a poor stunted creature and his art a poor art," one may wonder whether the conditions of art will be better understood then than now. "If you will read aloud well, then do it constantly; if you will write, then write," said a wise Greek. "But when you have not read aloud for thirty days together, but done something else, you shall see the result."

Somehow or other, despite the vulgarising influence of the aristocrat and the plutocrat, a certain amount of good art was produced. Are we prohibited from welcoming a possible return to these conditions? The American is the principal buyer to-day, not alone because he has the money to spend, but also because he has a house in which to place his purchase. The restlessness of the age, stimulated by the motor-car, the willingness to accept the limitations of a flat in exchange for a life freed from domestic responsibilities, have reduced home-life in this country to a very low ebb. Household gods are an incubus. Society is playing at this sort of life at the moment like a child with a new toy. It may again desire home comforts and pictures as furniture to the walls. The State, it is true, will be no greater than before. But the artist will ply his trade, live, and be happy.

Modern Cottage Architecture. Illustrated from the works of well-known architects. Selected and described by MATTHEW B. ADAMS, F.R.I.B.A. Second Edition, revised and enlarged. (Batsford. 1912. 10s. net.)

A NEW edition of this useful book will be welcomed by the ever-increasing number of the

Proposed New City Street.

Fig. 1. London Street Dangers: Mr. Clyde Young's Suggestion.

Fig. 2.

London Street Dangers.

Sir,—The recent articles in the daily Press concerning the increasing dangers of the London streets afford subject for thought. The sketch (fig. 1) shows the suggested treatment of Charing Cross, and would, I believe, considerably facilitate the movement of traffic and greatly reduce the danger to pedestrians; they would only have to guard against the traffic proceeding in one direction instead of negotiating eight streams as at present (Fig. 2). The idea of the scheme is to make the traffic rotate clockwise round a central island until it comes to the route along which it wishes to proceed, thus providing a stream continually winging from left to right, and so avoiding the chaos of traffic crossing each other. To form island, plant it with trees, and move King Charles statue would not be a costly matter, and would not interfere with any scheme for re-landscaping Charing Cross when the time comes. To carry the suggestion a step further would be to treat Trafalgar-square itself as a centre and make traffic rotate *vice versa* Charing Cross, Cockspur-street, Pall Mall East, north side Trafalgar-square, Duncannon-street, and West End, which would still further lessen the congestion, as the crossing at the bottom of Duncannon-street, Cockspur-street, and Pall Mall East would be avoided.

CLYDE YOUNG.

*An article on this subject appears on 37.—Ed.]

R.I.B.A. and the National Insurance Act.

Sir,—In accordance with well-established tradition our profession is again rudely awakened by the knowledge that our personal interests are involved in a matter of which away rumours were brought to our notice whose force we failed to discern. Our anxiety is now ruffled by the near approach of July 15, the date of the coming into force of the National Insurance Act.

One would have thought that the piercing shriek for unity would have taken form and idity on any ground, however disdained and parently mean, that presented itself as a visible centre for further growth and extension.

An opportunity is now available in the National Insurance Act, and nothing, to my knowledge, has been done.

I cannot imagine that it would prove ungratified or impracticable for the Royal Institute to form an approved society under the conditions laid down in the Act, with the co-operation of the Institution of Civil Engineers, the Surveyors' Institution, and the Society of Architects.

The compulsory conditions of the Act will weigh heavily upon the architect's assistant, and one of the primary indignities he will suffer will be that of being forced into societies which his special conditions and consequent disabilities of improved benefits will not consider, and he will find himself amongst very mixed crowd of mechanics and working men whose conditions of employment are far more provocative of ill-health and consequently lowering the scale of benefits to their level.

There is strong reason for believing that the bulk of practitioners will cease paying the full salary to their assistants when absent due to illness. An Inter-departmental Committee has recommended that civil servants shall not receive wages from the State during the period sick benefit is being received under the Act. With such an example as this before them, any benevolent decision that may have been made by employers on behalf of their assistants will be greatly shaken. It follows, therefore, that the scale of benefits for architects' assistants should be raised to the maximum to relieve those who desire to maintain their assistants' income at the same level in sickness as in health. This can only be done by an approved society composed of members living under similar conditions and thus presenting the necessary factors to determine the risks of illness and the consequent maximum benefits. It would prove more businesslike for the bulk of the profession to deal with a society promoted by the Royal Institute, and certainly more dignified and independent for the assistant than the alternative of compulsory entry into an organisation which cannot appreciate his interests or those of his employer.

The conditions for the formation of an approved society are mainly as follows: It must not be carried on for profit; the members elect their executive committee and officials; the membership must be at least 5,000; security against misuse of funds, either in form of a guarantee fund, a bond with personal securities, or that of a guarantee society; an audit of accounts by Government auditors, and a triennial actuarial valuation and adjustment of benefits or contributions to preserve solvency.

The Royal Institute is fully capable of this undertaking in conjunction with the societies I have named.

The advantages to be gained are those which will arise out of the proper study of all the circumstances which peculiarly concern our profession and to apply the result to the mitigation of any evils which may be brought about by this unwelcome addition to the Statute Book.

The prospect of the founding of such a society in which all classes of the profession are brought together suggests the formation of a platform of mutual interest upon which many reforms dealing with organisation could find a basis for further development. Other societies dealing with obscure trades are being formed with similar objects, and there is no reason why the Royal Institute of British Architects should not endeavour to make a similar use of the Act in regard to the architectural profession.

I trust that this effort to bring before your readers a practical aspect of an Act which is compulsorily thrust upon us, and will render its working less inconvenient, will receive the early attention of the Council of the Royal Institute within the next three months—October 14 next being now fixed as the final date for the formation of an approved society.

ERNEST J. DIXON. A.R.I.B.A.

Alterations to a House: John Thompson & Co. v. Thompson.

Sir,—From the report of this case given in your paper for July 5, page 25, it would appear that we had employed no foreman on this work.

Will you kindly allow us to correct this and to say that, whilst we did not consider it right to saddle our client with the expense of a "walking" foreman, we had in charge of the work a trustworthy "working" foreman in whom we have the utmost confidence, and such as we are accustomed to employ on work of this nature, whether contract or day work!

JOHN THOMPSON & CO.

The Insurance Act.

Sir,—The National Insurance Act will shortly be upon us, and no doubt thousands of your readers, like myself, are beginning to realise that a considerable amount of extra work will be thrust upon them every week, not only in stamping the cards, but in adjusting the wage sheets and books wherever any large number of men are employed; in other words, the clerks and others who have to deal with wages will become unpaid collectors for the friendly societies—a state of affairs which, to my mind, is unjust in the extreme. The societies themselves are entirely relieved of the cost and trouble of collecting the contributions. Can anything be done? Surely the societies or the Government should allow a stated sum for, say, every 100 men employed on large concerns, more especially where they come under both sections of the Act.

G. J. OSBOEN.

INTERCOMMUNICATION COLUMN.

Mural Painting.

Sir,—In your issue of July 5 "Mural Painter" inquires how his canvas should be affixed to the wall to avoid sagging and the ill-effects of damp. If the wall of his new church are now damp in any degree he will be unwise to begin operations at all; but if they are now thoroughly dry he should proceed as follows:—First paint the wall to be covered two or three coats in oil; also paint the back of the canvas. When he wishes to attach the canvas it must receive another coat of very stiff, or, as the painters call it, "round" white-lead; but, since handling it thus painted is a difficult matter, it is better to place it on a wood roller (if the space allows), rolling it on to the wall and painting it bit by bit as the canvas back is exposed. This needs much care, both in starting on a true line and pressing it evenly to the wall. Your correspondent speaks of painting in tempera; but a damp-proof back does not make for safety in tempera unless the painter is experienced in the strength of his medium (size or other), for it is apt to scale. If his walls are really dry he had better paint direct on the plaster. If he paints on canvas affixed as described he had better paint in "spirit fresco," or some such method. Gambier Parry painted in Gloucester Cathedral on canvas attached to the wall in the manner described.

J. D. CRACE.

ILLUSTRATIONS.

Regent's Quadrant Competition.

THE result of the competition instituted by the proprietors of the *Builder* was announced last week, and in the present issue several of the designs are illustrated. One of our plates shows the design placed first. It is by Messrs. Richardson & Gill, and of it the following criticism was made by Messrs. Fluckhart, Rickards, and Munby:—"The assessors consider that the principles embodied in the design placed first, as illustrated in the alternative sketch, are effective as carrying on the main horizontal lines laid down by the Piccadilly Hotel frontage, while preserving a scale of architecture suitable for the width of this particular street. They regret that the shop fronts and frieze of the windows under the main cornice were not detailed on the eighth-scale drawing, as they are shown on the alternative sketch."

Of the design by Mr. Albert W. Moore, F.R.I.B.A., which forms our second plate, the assessors wrote:—"No. 103 shows the same regard for practical considerations and general proportions as the above, but the use of pediments on this curved frontage is questionable, and the depth of the recessing between the two end blocks is too great. The detail would require to be more scholarly in execution than suggested on the drawing."

Thames House, Southwark Bridge.

This important building by Mr. Stanley Hamp, A.R.I.B.A., of Messrs. Colcutt & Hamp, is described in detail in the article beginning on p. 47.

MEETINGS.

SATURDAY, JULY 13.

Manchester Society of Architects.—Visit to Liverpool Cathedral and Midland Adelphi Hotel.

WEDNESDAY, JULY 17.

Northern Architectural Association.—Annual excursion.

COMPETITION NEWS.

A list of current Competitions is printed on page 60.

Regent's Quadrant Competition.

Illustrations appear in this issue of some of the designs submitted for the Regent's Quadrant competition promoted by the proprietors of the *Builder*, and further illustrations will be given in subsequent issues.

Scottish National Memorial to King Edward VII.

The following gentlemen were invited to take part in a competition for a memorial in Edinburgh to his late Majesty:—Sir R. S. Lorimer, Mr. G. Washington Browne, Mr. Hippolyte J. Blanc, Mr. J. J. Burnet, Mr. H. E. Clifford, and the late Mr. R. J. Macbeth.

The Executive Committee have adopted the design of Mr. G. Washington Browne, R.S.A., 24, Charlotte-square, Edinburgh. Mr. Albert H. Hodge will be the sculptor of the bronze group.

Glasgow Municipal Buildings Competition.

At a meeting of the Glasgow City Council, held on the 4th inst., the conditions of this important competition were finally approved, and they will be issued immediately to intending competitors.

The existing municipal buildings are well known as one of the most important works of the late William Young, and are practically square in plan with a centre courtyard. The principal front is to the west facing George-square, while the other fronts are on the north side to George-street, the south to Cochrane-street, and the east to John-street. The intention generally is to erect the extensions on the east side of John-street, and connect them to the existing buildings by a bridge or bridges, thus forming John-street practically into a second internal court.

The disposition and architectural treatment is, of course, left to the competitors, but its harmony with the existing building and with the existing sanitary chambers in Cochrane-street will require very careful consideration.

The conditions of competition as drafted were all that could be desired, but two rather

important modifications were made on them at the Council meeting. The arrangement is that the competition will be in two stages, and the intention was that the five best sketch designs submitted in the preliminary competition should be elaborated in the "final," but the right of nominating three additional well-known architects for this stage was reserved.

By a majority the Council decided to withdraw this latter clause. The other amendment made was to the clause in the conditions which provides that if no instructions are given to the selected architect to proceed with the building within twelve months from the assessor's award then he shall be paid a sum equal to 1½ per cent. of the amount of the estimated cost.

As this is 150,000L., the Corporation would thus be liable to pay about 1,800L. in the event of the building not proceeding. The majority of the Council considered this to be too large a sum, and it was agreed to fix the liability instead at 500L. An attempt was made to remove the clause excluding the Corporation's own architects from competing, but this proposal did not receive support.

The assessor, as we have before stated, is Mr. John J. Burnet, of Glasgow, and the profession at large will look forward with interest to the results of this very interesting competition. The date for submitting designs in the preliminary competition is fixed for October 29 next. The five selected competitors will be paid the sum of 100 guineas each.

Sheffield King Edward Memorial.

The assessors in the competition for the King Edward VII. Memorial Crippled Children's Institution (Mr. E. M. Gibbs and Mr. F. E. P. Edwards) have now submitted their award, which has been confirmed by the Committee. The names of the successful competitors are as follows, in the order stated:—(1) Mr. A. W. Kenyon, 84, George-street, Sheffield; (2) Mr. W. J. Hale, 13, St. James'-row, Sheffield; (3) Messrs. Hall & Fenton, 10, Paradise-square, Sheffield. The whole of the designs will be exhibited in the Mappin Art Gallery as soon as arrangements can be made for this to be done.—*Sheffield Independent*.

Proposed High School at Motherwell.

At a recent meeting of the Dalziel School Board it was resolved to proceed with the erection of a new High School on a site off Hamilton-road, and it was agreed to invite competitive plans from a few of the best-known architects in Edinburgh and Glasgow, and to allow local architects to compete if they desired.

Mr. J. J. Burnet, A.R.S.A., of Glasgow, was appointed assessor, and the premiums to be offered were fixed at 50L., 30L., and 20L.

The intention is to provide for a fully-equipped higher grade school, with provision for an elementary department which could be completed at some future date. No estimate of cost was fixed, but it is understood that this would be well up to 20,000L.

Town Planning in Huddersfield.

The Housing and Town Planning Committee of the Huddersfield Corporation invite competitive designs from architects for the laying-out of certain areas within the county borough and part of an adjacent suburb. Premiums of 100 guineas, 50 guineas, and 25 guineas are offered.

Proposed West of Scotland Teachers' Training College.

We understand that in connexion with the limited competition for this building the conditions are now being adjusted, and that Mr. Frank T. Baggeley, F.R.I.B.A., of London, has been appointed assessor.

The names of the invited architects for this competition are given on page 635 of our issue of December 1 last. They will receive an honorarium of 50L. each.

Proposed School at Govan-hill for the Govan School Board.

The Govan School Board propose to erect a new school at Govan-hill, and have invited the following architects to submit competitive plans:—Mr. Andrew Balfour, Messrs. H. & D. Barclay, Bruce & Hay, Halley & Nell, Honeyman, Kippie, & Mackintosh, and Thomson & Sandilands.

Designs for Royal Palace and Law Courts Sofia, Bulgaria.

H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new Law Courts. Four prizes are offered in each competition to the value of 10,000 francs (400L.), 7,000 francs (280L.), 4,500 francs (180L.), and 2,500 francs (100L.) in the case of (1); and 6,000 francs (240L.), 4,000 francs (160L.), 2,500 francs (100L.), and 1,200 francs (50L.) in the case of (2). Architects wishing to compete must submit their designs not later than December 1 next to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, etc., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch, as above.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Chelysmore, Chairman, presiding.

Loans.—The Finance Committee recommended, and it was agreed, that loans should be made to borough councils as follows:—Battersea, 997L. for street improvements; Stoke Newington, 8,000L. for repaving works; and Westminster, 21,436L. for street improvements.

Lambeth Bridge.—At the next meeting of the Council the Improvements Committee will recommend the Council to proceed with a scheme to Parliament for the building of new bridge over the Thames at Lambeth at cost of about 240,000L.

Chief Engineer.—The General Purposes Committee recommended, and it was agreed, that applications should be invited by public advertisement for the position of Chief Engineer to the Council to succeed Sir Maurice E. Maurice, who has resigned, at a salary of 2,000L.

The members of the present staff are to be allowed to make application.

FIFTY YEARS AGO.

From the *Builder* of July 12, 1862.

The Thames Embankment Bill.

THIS Bill has passed, in the Commons, through Committee of the whole House, which have expunged the obnoxious clause restricting the public roadway to a footpath between Whitehall Stairs and Westminster Bridge. This the House quite rightly persisted in doing, although the Government desire merely to amend the clause so far as to limit the absurd arrangement till Parliament should otherwise provide. Parliament preferred at once otherwise to provide.

** This exhibition of jealous regard displayed towards the precincts of Westminster finds a parallel two hundred years earlier, and is recorded in a footnote to Lord Braybrooke's edition of "Pepys's Diary":—"The landing-place leading from the Thames to New Palace-yard, still used by the Lord Mayor on their way to be sworn into office at the Exchequer, was styled in the old maps 'Westminster Bridge.' There had been a plan of building a bridge across the Thames near this place in 1664, which is thus noticed in the correspondence of the French Ambassador with Louis XIV.:—'Sur ce qu'avait été proposé de faire un pont devant Whitehall pour passer du côté de Faxeall, il n'y a été opposé par des vives remontrances; et le Roy a déclaré que de so vivant il n'y consentirait ce qui a extrêmement satisfait les bateliers qui sont un corps fort considerable dans cette Ville.'—Ed.

ARCHITECTURAL DEPARTMENT, UNIVERSITY OF LONDON, UNIVERSITY COLLEGE.

An exhibition of work done by students in the Architectural Department during the past session will be held in the Science Library, University College, from Saturday, July 13, to Saturday, July 20, both days inclusive. The exhibition will be open to the public from 9 a.m. to 6 p.m.

MONTHLY REVIEW *of* CONSTRUCTION.

Thames House : Central Entrance Hall.
Mr. Stanley Hamp, A.R.I.B.A., Architect.

THAMES HOUSE, SOUTHWARK BRIDGE, E.C.

STRIKING architectural work recently erected in a quarter of the City hitherto not particularly renowned for buildings consists of the large block of occupying a fine site at the junction of Thames-street and Queen-street-place, Southwark Bridge; it has been carried out from the designs of Mr. Stanley Hamp (of Messrs. Colcutt & Hamp).

The premises, known as "Thames House," occupy a portion of the estate of the Vintners' Company and adjoin Vintners' Hall at the end. They have been built for Liebig's Extract of Meat Company, Ltd., the lower portion including two covered yards, occupied by the London and South-Western Railway Company Messrs. Tate, together with a range of offices occupied by Messrs. Sandeman. The remainder of the building has been laid out for use as offices.

The main front, of which a portion is shown in one of our plates, extends along Queen-street-place for the length of about 280 ft., the front on Upper Thames-street is about 6 in. long, and the south front looking towards the river is about 80 ft. long.

As shown by the plans reproduced on page 49, the building is L-shaped in plan, the south wing providing several unusually lighted offices in an exceptionally open position.

On the steep gradient of the Southwark Bridge each—the main obstacle to the general of this cross-river communication—must be presented some interesting problems of solution by the architect when setting the floors of the new building. It is will be gathered from the statement

that the first floor is little above pavement level at the south end, and approximately 20 ft. above Upper Thames-street at the north end.

The varying level of the street has been dealt with by the architect in the ingenious manner illustrated in part on page 48, which shows a longitudinal section.

At the junction of Upper Thames-street and Queen-street-place the office or showroom, provided with a separate corner entrance, starts at a level about 3 ft. 6 in. below that of the ground floor, reducing the height of the lower ground-floor story beneath it by an equal amount.

By lowering the floor in this manner the height of the corner apartment is advantageously increased, and the floor is brought within 4 ft. 6 in. from the pavement, convenient means of access being furnished by two flights of four steps in the entrance.

On the western side of the Upper Thames-street front there is an independent entrance to the left, the use of which is not indicated on the drawings, but we presume the entrance and lift are intended for delivering goods to and from the vaults constituting the basement story.

In Queen-street-place, next to the corner office, is the lower main entrance, about 6 ft. below ground-floor level.

The entrance hall, slightly above street level, measures 25 ft. 6 in. wide by 12 ft. from front to back and includes two flights of stairs, one of eight steps leading up to the main hall and the other leading down to the lower ground floor and the basement.

On page 48 is a reproduction of a photograph of the lower entrance hall, and, although it enables our readers to gather an excellent idea of the general architectural treatment and the

handsome metal balustrades on the stairways and landings, it affords no indication of the harmonious colour scheme which is an equally noteworthy feature of the whole design.

The flooring and stair-treads are in Sicilian marble with black marble floor bordering, the walls and columns are finished in French *stucco*, and the ceilings and column capitals are executed in enriched modelled fibrous plaster.

The proportions of the main hall are considerably reduced by the store and lift enclosure at the left hand and right hand respectively, as well as by the staircase leading to the upper floors. The finish of the hall and staircase is generally similar to that of the entrance hall, and, as will be noted with satisfaction by those of our readers who are practically interested in fire-resisting design, the lift enclosure is solidly constructed in incombustible material.

About midway between Upper Thames-street and the south end of the building is the central entrance, approximately at ground-floor level. Just beyond this entrance the ground floor, lower ground floor, and basement stories are stopped by a transverse division wall, on the other side of which are the offices and covered yard of the London and South-Western Railway Company and the covered yard of Messrs. Tate.

The exterior of the central entrance is surmounted by a group of statuary representing Abundance, by Mr. F. Lynn Jenkins, R.B.S., of Kensington. Passing through a vestibule with curved sides, the main hall is reached, a well-proportioned apartment, at the back of which is the principal staircase, with a passenger lift in the square well.

Thames House: Interior of Lower Main Entrance Hall.

Mr. Stanley Hamp, A.R.I.B.A., Architect.

The walls are lined with marble to the height of 7 ft., the stiles and rails being in Vert d'Estours marble, and the panels opened out in Arni Alto marble. The pavement is laid in slabs of demi statuary with bands in Cipolline marble, other details of the decorative work being similar to those in the lower main entrance.

A few steps to the south of the central entrance is a doorway opening upon a lobby with a flight of three stairs giving access to the offices of the London and South-Western Railway Company. These offices are suspended over the adjoining covered yard, and are at the same level as the ground floor of the main building.

At the south end of the premises the first

floor is only a short distance above street level, and is approached directly from the upper main entrance, illustrated in our plates.

The sculpture over the doorway and above the windows on the fourth-floor story was executed by Mr. Richard Garbe.

From the porch a flight of ten steps leads up to the entrance hall, 26 ft. long by 10 ft. wide, including the staircase communicating with the floors above. The lift well here, as at the lower main entrance, is enclosed by the fire-resisting walls. Beneath the stairs is a room for the accommodation of electricity meters and main switches and fuses in connexion with the power and lighting circuits.

As shown in the plans, the offices over the yard occupied by Messrs. Tate are provided

with exit stairs, affording convenient means of communication between the various floors, and providing additional safety for occupants of the building in the event of fire.

Including the basement and lower floors, the building comprises five floors, with the exception of the part facing Upper Thames-street, where the main roof gives place to one at the lower level.

The plans illustrated are typical of the floors. The third floor is partitioned off for occupation by the directors and office staff of proprietors. On the upper floors the principal staircase landings from the ground floor to the fifth floor are finished in Sicilian and marble, the skirtings around the landings up the stairs being in Hauteville marble. The staircase walls and ceilings are in French and fibrous plaster, harmonising with the entrance halls. The corridors on the principal floor are similarly treated. Parquetry flooring has been laid in various offices and corridors, and marble terrazzo pavement in the lavatories.

The board-room on the third floor is a large apartment, 36 ft. long by 18 ft. wide, with two bay windows opening upon a balcony over Upper Thames-street. The interior is panelled in mahogany with carved limbo-frieze and enrichments executed by Messrs. H. H. Martyn & Co., Ltd., of Cheltenham.

With the exception of the principal rooms, halls, and staircases, the interior of the building is finished on simple lines suitable for office purposes, and we may add that the general character of the construction is well adapted for the erection of partition walls wherever may be required for the subdivision of interior space into large or small offices.

The building throughout is constructed of fire-resisting materials with solid floors, roofs, and, although considerable quantities of steel have been used in the form of stanchions, girders, and joists, it is essentially a masonry structure.

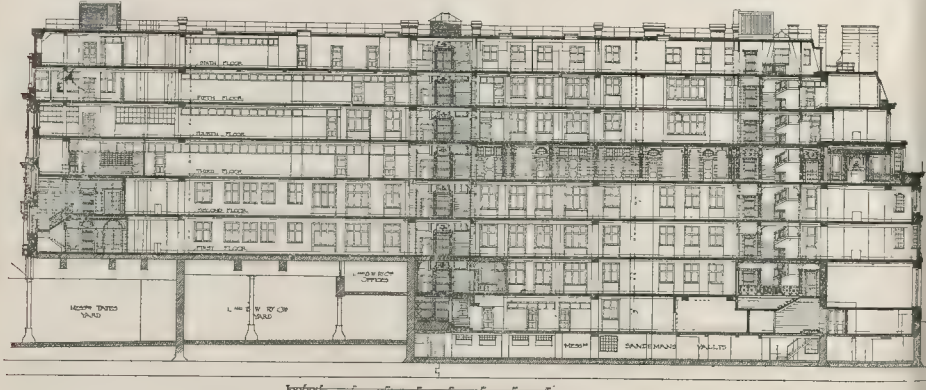

The exterior is faced with brown Portland stone on a basement story of grey Aberdeen granite, the front slopes of the roof being covered with green Westmorland slates, the roofs and flats at the back with asphalt. All the front window-sashes are in wrought iron, which has also been used to a large extent in the form of sliding sashes.

The general building contractors were Messrs. George Trollope & Sons & Colls & Son, Ltd., and the clerk of the works was Mr. Robinson.

The steelwork was constructed and erected by Messrs. H. Young & Co., Ltd., of Nine Elms, S.W., under the direction of Messrs. Rees Jackson, & Parry, the consulting engineers acting in conjunction with the architect.

Granite for the exterior was supplied by Messrs. Fyfe, Ltd., and the Portland cement by Mr. F. J. Barnes, of Portland. The London Fireclay Company, Ltd., supplied the "Gryppo" patent wall tiles and safety tiles in light green, ivory, and white glazes, and "Shepherd" partition bricks.

All the marble work described above was carried out by Messrs. Burke & Co., Rathbone-place, W., who also laid the terrazzo pavement in the lavatories and parquetry flooring in offices and corridors.

Thames House: Longitudinal Section.

Thames House: Part of Wrought and Cast Iron Balcony.

fittings generally are in white glazed fireclay, but a few single lavatories have whiteware basins with marble tops and skirtings.

Lifts.—The lift installation includes three passenger lifts supplied and fixed by the Otis Elevator Company, Ltd. Each lift has the capacity of 14 cwt., equal to the weight of about ten persons, and the car is arranged to travel at the maximum speed of 225 ft. per minute.

The guides are of steel T section, machined after rolling, and the car as well as the counter-balance is fitted with safety devices, intended to come into operation if excessive downward speed should be attained. Each lift is controlled from the car by a self-centring lever handle switch, enabling the attendant to run the car at maximum or slow speed at will.

The landing gates are equipped with electric contacts and auto-mechanical locks, preventing the car from being operated unless all the gates are closed, and also preventing the opening of any gate unless the car is opposite to it.

THE DRESDEN LABORATORY FOR ARCHITECTURAL ACOUSTICS.

By a decree of the Government Board of Education (Kultusministerium) of the Kingdom of Saxony, dated March 28, 1912, a Laboratory for Architectural Acoustics has been established in connexion with the Technical College (Technische Hochschule) in Dresden. Professor Dr. Heger, who for years has been engaged in examining concert-rooms, lecture halls, and churches as to their acoustic properties, is at the head of the Laboratory, which also contains a collection of instruments for acoustic experiments and researches. His proposals for improvements in that regard have in most cases proved quite satisfactory.

The Laboratory is intended to examine acoustic theories and to study the properties of building materials, especially to find co-efficients by which their acoustic qualities and their fitness for sound absorption can be numerically expressed. At the request of private persons and public corporations interested in concert-rooms, lecture halls, and churches, etc., the acoustic effect of these buildings will be examined either before or while they are being built, or while in practical use; if improvements are necessary, the Laboratory offers to work out the respective plans and to superintend their execution. Designs for new halls, etc., may also be submitted to the Laboratory for advice as to measures conducive to good acoustic results.

The result of the work achieved by Professor Heger before the opening of the Laboratory is laid down in the following fundamental rules, which will give directives for future work:—

The unsatisfactory acoustic effect of a room is generally caused by the fact that the sound arriving at the hearer's ear is disturbed by secondary sounds—i.e., the echo or reflection of preceding sound-waves; the reason of bad hearing is, therefore, always a surplus of sound, not too little of it. (The same result was arrived at by Exner, Vienna.)

The echo is caused by the sound-waves being reflected from the boundaries of a closed room, its walls, ceiling, floor, etc.

Every surface struck by sound-waves travelling through the air absorbs a certain part of the sound energy; thus every spot in the boundaries of a room is in its part effective in causing an echo. The total amount of sound thus absorbed is independent of the angle of incidence.

The absorbing factor of a wall, a ceiling, etc., indicates the amount of sound energy reflected by them. For a wide opening immediately leading into the open air this factor is 1. (Tabine's unit of sound absorption.) It is possible to treat the surface of a wall in a manner as to obtain a factor of absorption approximating 1.

The desirable distinctness of hearing can be attained in rooms of every description by treating the walls, ceiling, etc., so as to produce a sufficient absorption of sound. For most purposes a factor of absorption between one-tenth and one-seventh may be considered sufficient.

In order to produce a powerful acoustic effect the surfaces in the neighbourhood of the source of sound ought to reflect as much sound as possible, while the rest of the room ought to absorb as much sound as possible. The measures conducive to this effect in every particular case can only be ascertained by an expert in architectural acoustics examining the individual properties of the room in question.

Thames House: Metal Doors.

The Dresden Laboratory, though only short time in existence, has been requested give advice for improving the acoustic quality of concert-rooms, etc., at several places in Germany.

THE DISINTEGRATION AND PRESERVATION OF ANTIQUITIES.

F. RATHEN states that the disintegration of stone objects and pottery can nearly always be traced to the presence of soluble salts, the most effective way to preservation is to remove the salts by lixiviation. The method used may be for large objects, especially limestone blocks, pure tap water, spring or rain water for the smaller, more valuable articles distilled water must be used.

Occasionally articles are met with which not withstand lixiviation with water, and a trial test should be made in all cases. The water is changed frequently at first, and later at intervals of a week.

Illustrations are given in the author's paper of the manner in which the lixiviation, both small and of large objects, is carried out the laboratory of the Berlin Museum. After lixiviation and drying, limestone objects have their surface hardened by a treatment with "Fluat"; whilst the enamelled side of enamel bricks is coated with molten paraffin, the excess which is removed by rotating brushes. Cracked articles are bandaged before lixiviation, and afterwards are immersed in molten paraffin being allowed to cool before the bandages are removed. In the case of coloured objects treatment with "Fluat" will often fix and preserve the colour.

Superficial deposits of carbonate of lime objects which are themselves acid-resistant are removed therefrom by lixiviation with very dilute hydrochloric acid, followed by thorough washing to remove all traces of the acid used. In other cases such deposits are removed by mechanical means.

Superficial deposits on burnt clay or pottery are removed by heating slowly in a drying oven to 120 deg. C., and then introduced in a muffle-furnace heated slowly to 600 deg. C. After slowly cooling the articles are deprived of the deposits by a blast of air, by a soft brush or by prolonged immersion in water, as the case may be.

Metal objects are usually cleansed best by electrolytic reduction process, the metal object being either used as or connected with the cathode, and a weak electric current passed through the electrolyte. The hydrogen liberated loosens the coating of rust or the like, which can subsequently be removed by brushing, after which the object is thoroughly washed in water and then dried. Iron objects are removed from the water and immersed directly in molten paraffin at 120 deg. C., whereby the water is evaporated and the object becomes coated with paraffin the excess of which is subsequently removed. Bronze articles after cleaning are lacquered and lead ones are coated with wax. Iron objects frequently contain chlorine compounds which may completely disintegrate them; these compounds are to be removed by lixiviation in water, and then molten paraffin applied as described above. Tin objects must be kept

TABLE B.—COMPARATIVE COST OF REINFORCED CONCRETE AND TIMBER "MILL CONSTRUCTION" BUILDINGS.

Class of Building.	Area		Number of Stories.	Floor Superload per sq. ft.	Cost.		Reinforced Concrete Cost More or Less than Timber.	
					Reinforced Concrete.	Timber.		
	Ft.	Ft.		Lb.	£	£	Per Cent.	Per Cent.
Factory	140	60	3	330	5,700	5,600	18	—
Factory	140	60	5	200	11,300	10,400	7.7	—
Factory	112	112	4	—	17,200	17,000	0.82	—
Factory	100	45	5	—	16,500	14,800	11.4	—
Warehouse	155	20	9	—	14,400	10,400	33.0	—
Warehouse	155	20	9	—	39,300	42,500	—	7.8
Warehouse	94	38	6	20	8,600	7,900	10.2	—
Warehouse	120	100	4	—	12,720	12,300	3.25	—
Warehouse	200	100	4	—	26,200	23,400	12.0	—
Bakery	(60,000 sq. ft.)	—	—	300	12,500	12,800	—	2.35
Shop	—	—	—	—	3,580	3,500	19.4	—
Shop	—	—	—	—	13,800	13,100	5.6	—

the Museum at a temperature not below 50° C. in order to prevent the formation of "tinpest." Wooden objects should be coated with paraffin immediately after removal from the excavation, the fused paraffin being sprinkled or poured on to the object. Excesses of paraffin is subsequently removed by the application of a small gas flame $\frac{1}{8}$ in. in diameter. The author describes forms of air-tight cases in which objects can be preserved in an atmosphere free from pure and carbon dioxide, the usual active agents in corrosion.

Water casts may be rendered washable by coating the surface with wax or paraffin, the chemical which renders it less permeable. Cement for the cast with a solution of cellulose, known as "zapon," yields the results, and when this is done it may be easily washed with soap and water and a brush, but the treatment should be repeated every year or two as the surface cracks. Instead of "zapon," acetylcellulose, known as "cello," "cellite" may be used. In the discussion the foregoing recommendations as to casts, drying of the same was attributed to dry-smoke as well as to dust and handling. Ink stains may be removed by alcohol or methyl spirit.

THE COST OF BUILDINGS.

At the annual meeting of the National Association of Cement Users (U.S.A.) the following unit costs were presented of reinforced concrete buildings of various types as estimated by Messrs. Lockwood, Greene, & Co., architects and engineers, of Boston.

This firm have had extensive experience in the building of reinforced concrete, and the figures given below (see Table A), are of the same order of value.

TABLE A.—COST OF REINFORCED CONCRETE INDUSTRIAL BUILDINGS.

Class of Building.	Area.		Number of Stories.	Floor Superload per sq. ft.	Cost (including foundation).	
					Per sq. ft. of Floor Area.	Per cu. ft. of Contents.
	Ft.	Ft.		Lb.	s. d.	d.
Line shop	230	50	4	150	4 10	3 1
Line shop	230	100	2	150	7 9	5
Edge works	223	56	2	300	6 5	5
On mill	550	125	2	75	4 5	3
On shed	341	231	1	125	7 5	3
House	181	56	4	150	4 9	3
House	256	100	12	4	4 1	3
Average cost	—	—	—	—	5 7	4 3

The foregoing costs include everything, with the exception of heating and ventilation, lighting, and mechanical installations. The cost per square foot represent the total cost by the aggregate floor area.

Figures presented at a previous meeting of the same Association showed the average costs for twenty-one reinforced concrete buildings to be 7s. 2d. per square foot and 1s. 7d. per cubic foot. These structures were of varied character, the lowest costs having been 4d. per square foot and 3d. per cubic foot, the highest costs 22s. 8d. per square foot and 1s. 7d. per cubic foot.

In a recent issue of the *Engineering Magazine* H. G. Tyrrell gives a digest of the comparative unit costs of industrial buildings in the United States, and although the rates for materials and labour in that country differ considerably from those prevailing in Great Britain, the subjoined figures will be found useful for the purposes of comparison.

Reinforced concrete factory buildings from one to five stories high and about 50 ft. wide are to involve the following unit costs, exclusive of interior partitions, plumbing, heating, lighting, lifts:—

Number of stories.	Cost per sq. ft. of Floor Area.	Cost per cu. ft. of Contents.
	s. d.	d.
1	4 2	4 7
2	4 4	4 9
3-5	4 7	5 0

These prices apply to work done by contractors who are regularly engaged in reinforced concrete construction, and it is estimated that the cost would be exceeded by about 25 per cent. if the same work were performed by ordinary labour.

Building types in order of their relative first cost are thus arranged by Mr. Tyrrell:—

(1) Steel frame (complete), fire-proofed, with brick curtain walls and timber flooring.

(2) Steel frame (interior), fire-proofed, with self-sustaining brick walls and timber flooring.

(3) Steel frame (complete), fire-proofed, with brick curtain walls and reinforced concrete flooring.

(4) Steel frame (interior), fire-proofed, with self-sustaining brick walls and reinforced concrete flooring.

(5) Reinforced concrete throughout.

(6) Steel frame (part interior), not fire-proofed, with self-sustaining brick walls and timber flooring.

(7) Timber (mill construction) throughout.

It is a noteworthy point that even in an important timber-producing country like the United States the cost of reinforced concrete buildings is sometimes less or only a little more than that of timber buildings.

This comparison is similar to another estimate of the same kind in our possession relative to the cost of timber and reinforced concrete construction in America, and shows that the maintenance charges for a building of the second type may reasonably be expected to be 420l. less than those for one of the first type on the stated cost basis.

If capitalised at 6 per cent., the saving of 420l. per annum is equivalent to 7,000l. Consequently a reinforced concrete building would not really cost in the long run more than a timber mill construction building, even on the supposition that the initial outlay were 35 per cent. greater.

Comparing fire-protected steel-frame construction with reinforced concrete, Mr. Tyrrell finds that in the United States, for floor superloads of 150 lb. per square foot and upwards, reinforced concrete is from 5 to 20 per cent. less costly; for lighter loads the cost of the two types is nearly equal; and in the case of very light loads and long spans steel framing is less costly than reinforced concrete, particularly in single-story buildings.

Table C gives the relative cost for different kinds of protected steel-frame and reinforced concrete buildings in America.

Those figures appear conclusive as to the saving effected in the cases quoted, but it would not doubt be possible for a similar table to be prepared showing equal advantages for steel in respect of other buildings in the United States. Nevertheless, the comparison shows that reinforced concrete can often compete successfully with steel-frame construction.

It is to be regretted that figures of the kind quoted in this article are not available to show the relative cost of buildings in the United Kingdom.

DEMOLITION OF A TOWER BY EXPLOSIVES.

Owing to projected alterations on the property of the Port Talbot Railway and Docks Company, it recently became necessary to undertake the demolition of a power-house, together with a brick-built hydraulic accumulator tower 56 ft. high by 17 ft. square, the walls averaging 2 ft. 3 in. thick. Some large blocks of concrete, formed as foundations for boilers, engines, and machinery, had also to be removed.

Having regard to the proximity of the docks, it was necessary that operations should be conducted with the greatest possible care, and, as all the structures were of considerable thickness and built of concrete made with a view to permanent durability and strength, the work of removing them was one of considerable difficulty.

TABLE C.—COMPARATIVE COST OF REINFORCED CONCRETE AND STEEL-FRAME BUILDINGS.

Class of Building.	Area.		Number of Stories.	Floor Superload per sq. ft.	Cost.		Reinforced Concrete Cost More or Less than Steel Frame.	
					Reinforced Concrete.	Steel Frame.		
	Ft.	Ft.		Lb.	£	£	Per Cent.	Per Cent.
Factory	132	66	6	30	12,130	13,350	—	13
Factory	100	50	3	200	5,000	5,600	—	10.7
Warehouse	150	140	10	200	50,000	56,000	—	10.7
Office	120	86	8	70	34,000	36,800	—	7.6
Office	—	—	17	70	—	—	—	4.9
Mill	—	—	3	—	55,640	57,280	—	2.8
Mill	320	60	5	—	18,900	17,490	3.1	—
Store (shop)	120	71	6	125	17,900	19,200	—	3.6
Hospital	—	—	6	—	185,600	164,600	—	3.6
Hotel	140	120	8	70	34,200	36,800	—	7.0
Hotel	—	—	11	70	55,000	60,800	—	4.6

For the purpose of razing the accumulator tower the walls were drilled horizontally near the base along three sides. The holes were 1 ft. 9 in. deep, and were charged with ammonal explosive, 4-oz. and 6-oz. shots being employed on two opposite sides and 8-oz. shots on the third or falling side.

The total quantity of ammonal required to bring down this tower, the weight of which was fully 600 tons, was only 8½ lb., a fact illustrating forcibly the extraordinary power of modern explosives.

All the charges were connected by the means of Cordeau cable passing around three sides of the tower, and finished at the ends by electric detonator fuses coupled together and placed in connexion with an electric battery.

In order to obviate the risk of flying debris railway sleepers were stacked around the base of the tower, a device that proved quite efficacious after the firing of the charges.

The power-house walls also were demolished by blasting, the charges being fired by the Cordeau detonator.

A few days after the first series of operations the massive foundation blocks previously mentioned were destroyed in a similar manner. In every case the concrete was broken up into fragments of size convenient for removal from the site.

The operations were conducted throughout without any misadventure or injury to property, and to the entire satisfaction of the company.

CONSTRUCTION NOTES.

Reinforced Concrete Liquor Storage Tank.

IN a paper submitted to the Institution of Gas Engineers, by Mr. S. Meunier, Engineer of the Stockport Corporation Gasworks, is given a description of his experience in securing watertightness in a concrete tank. That description, with the accompanying diagram, we subjoin.

An additional liquor storage tank and a boiler-house were constructed near the river bank, the boundary wall of which was, after being raised and strengthened, cleaned and repointed. They also immediately adjoin the sulphate of ammonia stores. The gable wall

of this was taken down, and, after the liquor tank was completed, rebuilt upon the wall forming its west side. The liquor tank was put in on the reinforced concrete principle, after careful consideration of strengths, costs, and possible risks of leaking. The Kahn system was the one ultimately adopted, and from the illustration given herewith it will be seen that the walls, etc., are very light, being only 8 in. thick at the bottom and 4 in. at the top, while the tank is 10 ft. deep. The reinforcement, however, together with the arrangement of buttresses and the tying together of bottom, sides, and tops, makes the whole extremely strong. On completion it was left empty for a considerable time and kept under daily observation, and not the slightest sign of fracture or "giving" in any part was ever discovered.

The testing of the tank for leakage was also very carefully carried out. One or two leaks were found in the bottom (probably due to a little carelessness in rendering or defect in the mixing of the concrete), which varied somewhat in accordance with the height of the water in the adjacent river, but after being made right, and finding that the latter had ceased to create any effect, the tank was filled with water and left to stand, daily observations being made after the first week. It was found for a time that a small but definite loss took place, which was at last partially counteracted by floating dry and fine cement over the surface of the water; but a further difficulty then arose. There would be no diminution in level for a day or two, and then perhaps a drop of ½ in. a day for several days, interspersed with variations from zero to ½ in. each. After many attempts to elucidate the cause of this varying trouble, it was decided to coat the top of the tank with a hot mixture of thick tar and sand. It was then found that the apparent loss of water was stopped, but for a few days only. However, by a repetition of the process, with an ultimate addition of a further two coats, a complete cure was established.

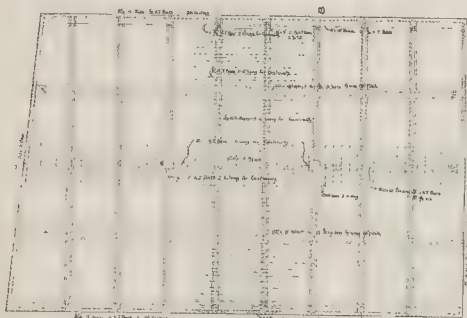

Reconstructed in the most advantageous manner appears to have originated in Germany, where this waste product is largely employed as

flooring, wainscoting, stair-covering, and roof material, in the form that may be designedly reconstructed wood. The sawdust is mixed with magnesium chloride in proportions determined by scientific investigation, the result a composition suitable for the manufacture of tiles, or if mixed on the site where it is used for the formation of floor and surfaces. The addition of colouring materials imparts the appearance of linoleum to finished work. This method of utilising sawdust is by no means unknown in Great Britain, where compositions of the character described are sold by various firms under distinctive designations.

Reinforced Cast-Iron.

A SOMEWHAT novel suggestion made by Dr. von Empey, Vienna, embodies the employment in building construction of hollow cast-iron columns reinforced with concrete in which are embedded spiral coils of steel. Experiments made with four columns of which one consisted of cast-iron only and the other three were reinforced, showed that the effect of the reinforcement was to increase the ultimate resistance by about two and a half times. While the idea is distinctly ingenious we scarcely think it will be generally adopted in view of the greater economy of concrete as compared with iron and steel, for resistance to compression.

F. M. LITTSCHIED examined the so-called "Risk of Lead Poisoning from coating on the interior of Domestic Boilers." certain large copper boilers used for obtaining hot water for household purposes, found that this coating sometimes contained a large quantity of lead. Solder containing lead is also employed in making the joints in vessels. Experiments showed that lead dissolved in appreciable quantity when water was heated in such vessels; a part of the remains in solution, whilst some goes into the sediment of calcium salts, which separate from the water when raised to the boiling-point. The formation of scale in the vessels may, at a time—especially with a hard water—diminish the quantity of lead dissolved from the coating, but a possible source of lead poisoning may arise from the fact that the coating is not of pure tin.

The Stockport Gasworks: Liquor Storage Tank.

Mr. S. Meunier, Engineer.

THE BUILDING TRADE.

INSURANCE ACT: UMPIRE'S DECISIONS.

in pursuance of the regulations made under sect. 91 of the Insurance Act the umpire has given a very large number of decisions various classes of workmen in respect of contributions are payable as being engaged in insured trades for the purposes of insured insurance. The insured trades are listed in the sixth Schedule of the Act, and we set out those decisions which appear under the heading of "Building."

Workmen described as bricklayers, plumbers, masons, scaffolders, plasterers, and the like, of each employed by millers and so forth wholly or mainly in the work of construction, alteration, repair, decoration, or erection of buildings. Bricklayers, slaters, and labourers of each similarly employed by any company. Workmen employed by painting and weaving company as carpenters, joiners, and mechanics wholly or mainly in the repair of machinery; apprentices to the same if employed wholly or mainly by way of labour under a contract with the employer if above the age of sixteen and not under apprentices.

Painters and tilers employed by builders' firms in construction, etc., of buildings. Workmen engaged in the work of fixing stone preparation and dressing of stone (excluding slate) to finished dimensions for use in insured trade under Schedule 6.

Joiners, carpenters, joiners, plumbers, masons, scaffolders, plasterers, and their like, engaged wholly or mainly in the construction, etc., of buildings in connexion with businesses other than insured trades, etc.

Joiners and labourers employed by a firm of joiners engaged wholly or mainly in the construction or rebuilding of kilns. The firmers of the same employed engaged in fixing tiles on or existing buildings, also carpenters and joiners engaged in repairing buildings. Workmen in the employ of a borough council engaged in internal fixed woodwork of school buildings. Workmen engaged in fixing stone preparation and dressing of stone (excluding slate) to fixed dimensions for use in insured trade. Workmen employed by a firm of roofing felt manufacturers and roofers, and engaged in the work of fixing tiles on or existing buildings, also carpenters and joiners engaged in repairing buildings. Workmen engaged in the work of fixing tiles on or existing buildings, also carpenters and joiners engaged in repairing buildings.

It is "persons engaged in lathing, plastering, gutters and spouting, slating, and rendering lead gutters, lead flashing, and counter-flashing."

Persons preparing and dressing stone for use in the construction of a simple character, such as are to be found in cemeteries, and fixing the same.

Persons engaged in the work of repairing sewers, and persons engaged in the work of repairing sewers.

In carrying through the above decisions it will be seen that the difficulty of ascertaining the liability of employers under this part of the Act is really occasioned by sect. 107 subsect. (2), which provides that "in determining any question as to whether any trade in which a man is or has been employed is an insured trade or not, regard shall be had to the nature of the work in which the workman is engaged, and to the business of the employer on whom he is employed."

When the Insurance Bill was introduced the question was certainly conveyed that employment insurance was in the nature of a new specified industry. The above decision has extended the operation of the Act to a most extraordinary way, and this has led to the general health insurance.

It is to be seen from the above decisions, any person carrying out a process which is not to come within the trades mentioned in Schedule II, is liable under penalty to pay contributions. This involves the same kind of difficulty that was introduced in the Work-

men's Compensation Act of 1897, and which experience proved to be so inadvisable.

In the building trade some sort of principle can be extracted that any person wholly or mainly engaged in the construction, alteration, repair, decoration, or demolition of buildings is to be insured, but in other trades, such as "mechanical engineering," the difficulty of determining who has to be insured is greater. But even in the building trade, difficult points arise. For instance, take the decision quoted above, "workmen engaged in the preparation of stone and dressings (excluding slate) to fixed dimensions in connexion with any trade set out in Schedule 6." What heading in Schedule 6 does this come under? The definition of "building" is the construction, etc., of buildings, "including the manufacture of any fittings of wood commonly made in builders' workshops or yards." We can see no heading which would include the dressing of stone to fixed dimensions apart from fixing the same in position. By sect. 101 subsect. 6 these decisions of the umpire, moreover, appear to be conclusive, yet the points he has to decide are very similar to those which have caused such difficulty both in the lower Courts and in the Court of Appeal and the House of Lords. This decision by departments is a new modern departure, and it may save litigation, but it imposes "burdens grievous to be borne" on individuals who can have no redress.

THE SELECTION OF BUILDING MATERIALS.

In days when the transport of materials from place to place in one country or from one country to another was costly and troublesome, building materials were primarily responsible for the development of architectural styles, or for the adoption of certain styles in different countries and localities.

It is true that materials were sometimes brought from great distances in ancient days, as, for instance, for the building of King Solomon's temple; but the almost universal practice was for architects to employ such materials as could readily be obtained in the immediate neighbourhood of the building to be erected.

One happy result following the employment of indigenous building materials was the harmony existing between buildings and their surroundings.

Examples of this harmonious association are to be found in many parts of England. Nothing is more charming than the timber-built cottage or country house in a well-wooded district; nothing is more appropriate than the warm-toned red brick house in a district where the whole landscape gives evidence of the red earth providing material for the bricks; and nothing more fitting reflects the spirit of a rocky and mountainous region than the solidly-built stone house.

With the increase and multiplication of transport facilities the building materials of the entire world are placed at the disposal of the local architect, with the result that characteristic architecture is far less evident than formerly in individual districts of this and other countries.

That the same kind of change is taking place in Canada is shown by a recent article written by Mr. Philip J. Turner, F.R.I.B.A., of McGill University, on the "Use and Selection of Building Materials." Adverting to this point, Mr. Turner says: "We see stone used in brick districts, brick in stone, and many other such anomalies, apparently for no other reason than that the owners like to be ostentatious and to show they have plenty of money to spend, instead of having a well-designed, unobtrusive building in keeping with its surroundings."

The article to which we refer contains many useful hints on the use of familiar materials, such as stone, brick, and wood, and quite deserves consideration by the profession, as the following references will make clear to our readers.

In the selection of stone durability is obviously a most important point, as evidenced by cases adduced by Mr. Turner.

For instance, the limestone selected by a Commission in 1839 for the Houses of Parliament has proved to be particularly unsuited to the atmosphere of London, although similar limestones have been largely used from early times in the purer air of Yorkshire and the adjoining counties with satisfactory results.

A more happy experience is furnished by the choice of Portland stone for the building of St. Paul's Cathedral and by the precaution of Wren in forbidding the use of any block of stone that had not been seasoned for many months.

But we are reminded further that the numerous variations in the characteristics of building stones make the task of selecting material for any given work, or of adapting the work to the available material, one that often requires serious consideration.

If the material has already been selected style and detail must be adapted to its character. Thus, if it is tough and difficult to work it would be absurd to adopt a style requiring wrought stone in large quantities; if it is also without cleavage or distinct bedding planes even coursed rubble work might be out of the question; and if the beds are only a few inches thick massive effects requiring large stones cannot be attempted.

Again, assuming the stone to be soft and perishable, close joints and smooth finish should prevail, and projections likely to catch water should be avoided unless executed in stone of harder description.

In the endeavour to treat stone sculpturally by undercutting in the same way that he had followed in his wood carving Grinling Gibbons did violence to the true and essential qualities of the material, which in course of time fell to pieces.

Sandstone mouldings must be bold and large, and granite calls for bold and simple treatment without over-elaboration in sculptural details.

Marble in its fulness of grain is the exact opposite of granite, and is capable of receiving the most delicate mouldings and the most exquisite finish in carving. As an illustration of the appropriate uses of marble in architecture Mr. Turner cites the altar in the Church of Santa Maria dei Miracoli, Venice, where this material is employed in three characteristic ways:—(a) In wall panels, the figure of the marble being utilised as decoration; (b) in delicate carving; (c) in mosaic work.

In discussing timber, Mr. Turner deals more particularly with the varieties of wood available in Canada, but many of his remarks are worthy of attention by young architects in every country.

The toughness and density of timber have necessarily to be considered in determining the character and size of details and mouldings. Hardwoods permit sharp thin lines, and small and delicate mouldings that would be impracticable in softer materials.

Certain varieties of wood, like some kinds of marble, are characterised by grain and figure rendering them particularly suited to decorative purposes in the form of panels simply treated with few mouldings.

The possibilities of brick in architecture are great and varied. The material is one lending itself to pleasing effects by the use of different shades of brick. For example, grey or purple brick for the quoins, arches, and bands of a building, in conjunction with red brick for the general wall surfaces, makes a happy combination and gives interest, provided the colour contrasts are not too marked.

The tone of brick walls may be uniform or varied and the texture fine or coarse. With a fine texture the tone should be uniform, and variety of tone is pleasing where the texture is coarse.

Bricks of special dimensions, such as the Roman brick, are often useful for variation of treatment, and cut or rubbed brick can be employed with very pleasing effect, but, as Mr. Turner rightly says, work of this kind should always be framed by stronger material, and not applied in structural forms lending, or appearing to lend, support to stronger material, whether brick or stone.

CONCRETE-MIXERS: THE WHALLEY MIXER.

PATENTED by Mr. Whalley, of Blackpool, this concrete-mixer is supplied by Messrs. Bristowe & Co., Ltd., of Westminster. The illustration on this page shows the machine, which can be placed on any convenient support or supplied with carriage and wheels.

It comprises a stationary pan with a vertical shaft having radial arms which are fitted with stirrers. The pan is cast with brackets for the side standards and bridge carrying the gear for rotating the central shaft and stirrers in connexion therewith. At the front of the pan is a discharge valve for the delivery of mixed concrete, and at the back of the machine is a hopper for feeding materials into the pan.

The action of the stirrers is such that while tending to move the materials towards the periphery of the pan the process of mixing is thoroughly completed before the contents of the pan could escape through the discharge outlet, even if the valve should have been left open by accident or carelessness.

The only parts of the machine subject to appreciable wear are the lower extremities of the stirrers, which can be detached readily and renewed at comparatively trifling cost.

The machine is made in three sizes with the capacity of 7½, 13½, and 18 cub. ft., mixing the same number of cubic yards per hour respectively. The largest machine is stated to be capable of mixing 1 ton of concrete within two minutes, 3·6 horse-power being the maximum power required for driving the machine.

CONTRACTORS AND THE INSURANCE ACT.

ON Tuesday a meeting of contractors was held at the Holborn Restaurant to consider the position arising out of the National Insurance Act. The meeting, which was very well attended, included representatives of the following amongst other firms:—Messrs. Airds, Ltd., Pauling & Co., Ltd., the Metropolitan Amalgamated Railway Carriage and Wagon Company, Ltd., C. J. Wills & Sons, William Griffiths & Co., Ltd., Robert McAlpine & Sons, Louis P. Nott, H. H. Nowell, Perry & Co. (Bow), Ltd., Alfred Thorne & Sons, Pethick Dix & Co., Thos. Wrigley, G. Percy Trentham, F. & H. F. Higgs, W. & J. R. Watson, Ltd., George Law, Rowley Bros., James Dickson, H. J. Harding, Chas. Wall, Ltd., Tabor Trego & Co., Ltd.

Mr. W. Griffiths, representing the National Health Commissioners, explained Part I. of the Act relating to health insurance; and was afterwards questioned at considerable length by those present. He explained that an employer employing over 100 hands could make arrangements for bulk stamping. If the workers agreed to leave their cards with the employers the cards could be stamped quarterly, but full facilities must be given for workmen who left before the end of the quarter to get their stamped cards.

The following were some of the more interesting questions put to Mr. Griffiths:—

Q.—A contractor may have 500 or 600 men working for him during the quarter. At the end of the quarter perhaps only sixty are still in his employ. What advantage therefore is the bulk stamping arrangement for him? A.—If it is no advantage you will not adopt it.

Q.—When 500 or 600 men are employed on a work, will it not be physically impossible to go round and put the stamps on at pay-time and cancel them? A.—You can do that with an indelible stamp; but with all respect I think you will find that the men will not be dying to keep their cards, and that there will be no difficulty in arranging with the employer.

Q.—Supposing a man is discharged in the week for being drunk? A.—At the time of paying the wages you must put the stamp on the card.

Q.—On large works navvies come for a job and are put on. Often they have been tramping and have no money, and at breakfast-time they ask for a "sub." Is that "sub" the first payment of wages? A.—It appears to me to be so. It is actually a payment of wages.

Q.—The ganger puts such a man on, not knowing what sort of a man he is, and after finding out what he is discharges him. Is it the correct meaning of the Act in such a case that the employer pays 3d. and the man 4d.?

A.—I cannot see any possible reason for it not being so. The first employer in the week is responsible, subject to any arrangement he may make with the man's other employers. I will make a note of it and let the Commissioners know of the practice.

Q.—A contractor may get four or five men of the kind in a week, and so would have to pay four or five contributions and yet not get a week's work done? A.—There is no doubt about it. If the contractor is the first employer in the week, or the only employer, he has to pay the contribution.

Mr. Robert Bogan (of the Board of Trade Labour Exchange) then explained Part II. of the Act, and said that the Government had appointed an officer called "the Umpire," who

was to give the final decision as to whether any men or class of men were in or out of the Act. It was the work of the workman, not the business of the employer which was in gauge of whether a man came under Part II. of the Act. As an illustration, a firm of might employ 500 printers who would be liable to be insured, but if they employed one engineer to see to the machinery the man must be insured.

Answering questions, Mr. Bogan said that the difficulty of halfpennies the employer could put a 3d. stamp on the card one week and a 2d. stamp the next week. When a man left his employment he would lodge his card with the Labour Exchange, and the employer would be given a receipt, and the product of that receipt would be equivalent to the deduction of the book.

Amongst the more striking questions addressed to Mr. Bogan were the following:

Q.—A man leaves his employment, his book at the Labour Exchange and his receipt. He goes on tramp and gets two miles away, but in the meantime has been at work. Is it illegal for the employer to have in his employ a workman in the same trade without having received from the workman his unemployment book?

Q.—Contractors often have a big delivery of bricks or girders, and so on, and the foreman goes out and picks up men to unload, and pays them 1s. each. Has the contractor to pay the unemployment insurance? Yes; but I would point out that a telegram message to the Labour Exchange would get the men.

Mr. Newall pointed out that the framers of the Act seemingly had failed to make the conditions of contractors. They carried great waterworks, with aqueducts over 40 miles of country. There were no Labour Exchanges there, and the gangers were the men in charge. The ganger might have men on the Saturday and on the Monday that half had gone and new men had turned up without cards.

Mr. Bogan replied that the contractor must not engage such men, but modify his reply by pointing out that the Act said that a man must hold or at once apply for an unemployment book. If the man had not a book it would be the contractor's duty to take him to get one.

Mr. Bogan was also questioned as to the position of the contractor with regard to sub-contractors, and the case was put before him by the paperhanging. He said that the point was whether the contractor had the exclusive right to a man's services. Supposing the sub-contractor had men working for him, could the substantial contractor employ them? If not, then the sub-contractor would be responsible for the men.

A small Committee was subsequently appointed for the purpose of dealing with points which arose affecting contractors.

Messrs. Carter & Co., Ltd., tile manufacturers of Poole, recently called a meeting of employers regarding the Insurance Act, and Mr. Charles Carter, who presided, informed the employees that it was the intention of the directors to pay the employees' contributions as well as the employers'. The announcement was received with much gratification.

UNEMPLOYMENT INSURANCE

MR. RENDALL asked the Secretary to the Treasury whether a timber merchant dealing in building, supplying the trade with timber, and converting the timber from logs into boards, planks, etc., falls under Part II. of the National Insurance Act.

Mr. J. M. Robertson, in reply, pointed out that decisions as to what class of work was included in the list of insured trades for the purposes of Part II. of the Act rests with the Umpire appointed under sect. 89. On July 1st the Umpire decided as follows:—"Converting of timber is not payable in respect of work done by timber merchants, who are engaged in working sawmills and engaged wholly or mainly in the work of converting timber logs into planks, boards, or scantlings."

The Whalley Concrete-Mixer.

mersmith.—Erection of a building on

Westminster.—Additional story at No. 32, Old Queen-street, Westminster (Mr. H. J. Appleton).—Consent.

* See also our list of Competitions, Contracts, etc., on another page.

J. H. Langlands, architect, 31, Murraygate, Dundee.

Dunfermline.—Additions to Central Library (2,000.); Mr. James Sheares, architect, 3, Bonner-street, Dunfermline.

Duns.—Alterations to gasworks (2,000.); Secretary, Duns Gas Company.

Dunscur (near Bolton).—Picture hall (2,000.); Mr. H. Booth, architect, 42, Regent-street, Haslingden.

East Cowes.—Liberal club, York-avenue; Mr. S. E. Tomkins, architect, High-street, Newport, Isle of Wight.

East Kilbride.—Church halls, Parish Church (1,850.); Mr. D. A. Robertson, East Kilbride, Edinburgh.—Six houses, Murray Field, gardens, for the Murrayfield Real Estates Company, Ltd. Extensions to College of Agriculture (6,000.); Mr. T. P. Marwick, architect, 43, York-place, Edinburgh. Extensions to school of cookery, Atholl-crescent (4,000.); Mr. Ramsay Taylor, 140, Princes-street, Edinburgh. Church, Roxburgh-place; Trustees, Lady Glenorchy's Church.

Elworth.—Enlargement of United Methodist Sunday-school; the Trustees.

Exeter.—Headquarters for the Devon Royal Garrison Artillery (3,000.); Messrs. Ellis, Son, & Bowden, architects, Bedford-circus, Exeter.

Falkirk.—Extensions to bakery (3,500.). Mr. J. G. Callender, Royal Bank-chambers, Falkirk.

Falkstones.—Plans have been passed for alterations and additions to the Railway Hotel, Cooling-lane, for Messrs. Nalder & Collyer, Ltd., Croydon; Messrs. Bromley & Dahl are the architects. Offices and showrooms in Dover-road, for the Falkstones Co-operative Society; Mr. G. H. Camburn, architect.

Giffach.—Five hundred houses; Mr. Beidoo Rees, architect, Cardiff; Welsh Garden Cities, Ltd., builders.

Gilmerton.—School (5,000.); Mr. James Inch Morrison, 21, York-place, Edinburgh.

Glasgow.—Workshops and stores, Haiston-place, for the Scottish Co-operative Wholesale Society, Ltd., 95, Morrison-street, Glasgow. Conversion of 137, Argyle-street into picture theatre; St. Enoch's Picture Palace, Ltd., London. Offices, St. Vincent-street, for the Phoenix Assurance Company, Ltd. Picture-house, Campbell, Mr. Thomas Bair, architect, 134, Bath-street, Glasgow. Bottling store, Great Eastern-road, for Messrs. A. G. Barr & Co., Ltd., mineral water manufacturers (3,000.); Mr. James Callender, Royal Bank-chambers, Falkirk. Extensions to bakery, Princes-street (4,000.); Messrs. Boston, Menzies, & Morton, architects, 11, William-street, Greenock. Picture theatre, Gairbraid-street (2,000.); Mr. A. V. Gardner, architect, 145, Bath-street, Glasgow. Extensions to Kelvinvale Paper Mills (2,500.); Mr. James Carruthers, architect, 147, Bath-street, Glasgow. Works for Messrs. Stewart & Lloyds, Ltd., tube manufacturers, 41, Oswald-street, Glasgow (7,000.). Extensions to Sidney-street Engineering Works for Messrs. John Deas & Co. (2,500.). Messrs. Miller & Black, architects, 55, Renfield-street, Glasgow. Halls, London-road, United Free Church (2,000.); Messrs. Salmon, Son, & Gillespie, architects, 53, Bothwell-street, Glasgow.

Glossop.—Schools (7,725.); Mr. T. Haynes, Surveyor, Town Hall, Glossop.

Gravesend.—Extensions at works, Clifton Marine-parade, for the Imperial Paper Mills, Ltd.

Greenock.—School, Finnart-street (12,000.); Mr. W. R. Glen, 144, St. Vincent-street, Glasgow. Proposed baths and washhouses, Ann-street; Mr. A. J. Turnbull, Master of Works, Burgh Hall, Greenock.

Halifax.—Picture theatre (10,000.); Mr. W. W. Longbottom, George-street, Halifax.

Halwistle.—Laundry for the South Tyne Laundry Company.

Hastings.—All Saints' School; Mr. F. Plowman, architect, 35, Havoc-road, Hastings.

Heckmondwike.—Extensions to Heckmondwike Co-operative Society's central stores; Mr. H. Stead, architect, Kaye-street, Heckmondwike. Warehouse, Station-lane, for the Great Northern Railway Company.

Hexham.—Additions to Corn Exchange (2,000.); Messrs. Cackett & Burns Dick, architects, Pilgrim House, Pilgrim-street, Newcastle.

Holden Wood (near Haslingden).—Bleach works; Mr. W. H. Booth, architect, 42, Regent-street, Haslingden.

Horsforth.—School (2,400.); Mr. W. V. Dixon, County Council-buildings, Wakefield.

Hove.—A plan has been approved for the erection of four houses in Langdale-road for Mr. T. Barnard. A plan has been lodged for alterations and additions to the Albion Hotel, 110, Church-road, by Mr. A. B. Packman, for Messrs. Tamplin & Sons.

Hull.—Seed mill for Messrs. T. J. & B. Thompson (3,000.); Messrs. Walker & Son, 77, Lowgate, Hull.

Ivybridge.—Catholic church; Mr. B. O. Brian, architect, Coburg street, Plymouth.

Kilmarnock.—Extensions to hospital (10,700.); the Managers.

Kilnnington.—Vicarage (2,000.); Mr. W. D. Caroe, architect, 3, Great College-street, Westminster, S.W.

King's Norton.—School, Selly Oak-road; Mr. H. E. Stilgoe, Surveyor, Town Hall, Birmingham.

Kirkwall.—Restoration of St. Margaret's Cathedral; Mr. G. M. Watson, architect, 15, Dublin-street, Edinburgh.

Langark.—Institute and library (2,100.); Messrs. Traill & Stewart, architects, 38, High-street, Lanark.

Ledbury.—Alterations and additions, Besbury-court, near Ledbury (3,000.); Mr. A. D. Black, architect, 51, North John-street, Liverpool.

Leek.—Extensions at Albion Mill for Messrs. A. Ward & Co. bread manufacturers.

Leicester.—Additions at lunatic asylum (9,300.); Mr. E. G. Mawby, Surveyor, Town Hall, Leicester.

Leven (Fife).—Extensions to Durrie Foundry for Messrs. Henry Balfour & Co., Ltd. (7,000.).

Lisburn.—Bank premises for Ulster Bank; Messrs. Blackwood & Jory, architects, Dublin.

Longton (Stafford).—Proposed alterations and additions at Cottage Hospital; Mr. W. Atkins, Secretary, Cottage Hospital, Longton.

Mansfield.—Additions to Conservative club, Blind-lane; the Secretary.

Mexborough.—Business premises (6,000.); Mr. W. C. Laidlaw, architect, 13, George-street, Edinburgh.

Middlesbrough.—Graving dock; Mr. J. Mitchell Moncreiff, architect, Consett-chambers, Newcastle; Sir John Aird & Co., Ltd., builders, 22, Queen Anne's-gate, Westminster, S.W.

Millport.—Additions to school (2,500.); Mr. A. McKinley, architect, 6, Castle-street, Rothsay.

Mirfield.—Warehouse, Holm Bank Mills, for Messrs. James Walker & Sons, Ltd., blanket manufacturers.

Moulton.—Four houses (740.); Mr. J. W. Darby, builder, Boston.

Nethertown.—Institute; Mr. James Lindsay, architect, 248, West George-street, Glasgow.

Newton Abbot.—Extension, Constitutional Club; Mr. F. E. L. Downes, 36, Queen-street, Newton Abbot.

Norwich.—Children's home (2,956.); Surveyor, Guardians' Offices, Norwich.

Nottingham.—Picture hall, Harley-street (1,800.); Mr. H. Booth, architect, 42, Regent-street, Haslingden.

Partick.—Alterations and additions to Pathological-buildings (3,000.), for the Managers, Glasgow Western Infirmary.

Pelsall.—School (250 places); Mr. G. Balfour, County-buildings, Stafford.

Pontefract.—Artisans' dwellings; Mr. W. J. Tennant, architect, Bozergate, Pontefract.

Pontypridd.—Co-operative premises; Messrs. Richards & Kaye, architects, Market-street-chambers, Pontypridd.

Port Talbot.—Church, Oakwood; Mr. F. R. Kempson, architect, High-street, Cardiff.

Preston (South Devon).—Church; Mr. J. C. Beare, architect, 68a, Queen-street, Newton Abbot.

Prince Rock (Plymouth).—Almshouses; Mr. F. A. Wiblin, architect, 82, Old Town-street, Plymouth. Messrs. Wakeham Brothers, builders, Knighton-road, Plymouth.

Rampton.—School (200 places); Mr. C. J. Bristowe, County-buildings, Nottingham.

Rawtenstall.—Weaving shed, Fuld (4,500.); Mr. A. Brocklehurst, architect, St. James'-chambers, Waterpool; Messrs. Moore Brothers, builders, Burnley-road, Rawtenstall.

Redcar.—Court-house (1,200.); Mr. W. H. Brierley, Architect, County Hall, York.

Rhynie (Aberdeen).—Additions and alterations to schools (2,500.); Messrs. Brown & Watt, architects, 17, Union-terrace, Aberdeen.

Romford.—Isolation hospital at infirmary; Mr. W. Smith, Guardians' Offices, Romford.

Rothsay.—Church hall (3,080.); Mr. A. McKinley, architect, 6, Castle-street, Rothsay.

Royston.—Extensions to Roy Spinning Mill; Mr. Sidney Stott, architect, Oldham; Mr. J. T. Bates, 625, Rochdale-road, Royston.

Salisbury.—Extensions to station (5,000.); Mr. J. A. Coomb Hood, London and South Western Railway, Waterloo Station, S.E.

Shoreham-by-Sea.—Congregational church (2,500.); Mr. E. J. Hamilton, architect, 13, Wellington-road, Brighton.

Smethwick.—Stores, Grove-street, for the Centaur Tool Works, Ltd., 1, Grove-street, Smethwick.

South Shields.—Graving dock for Messrs. Redhead & Co.; Mr. J. Mitchell Moncreiff, architect, Consett-chambers, Newcastle; Messrs. Nuttall & Co., builders, Trafford Park, Manchester.

Southwick-on-Wear.—Public hall, Beaumont-street; Messrs. J. Potts & Sons, architects, John-street, Sunderland.

Stratford.—Extensions to baths and alterations to Town Hall and Library (7,750.); Robert Carlyle, builder, Elsinore-road, Trafford, Manchester. The following have been passed: Picture hall, City, for Mr. W. Openshaw; cotton storage houses, Westinghouse-road, for the Trafford Park Company; picture palace, King-street, for Mr. J. L. Doniger.

Tipton.—Alterations and extensions to of for the Horseley Company, Ltd., whole ironfounders, Horseley Works, Tipton.

Truro.—School, Daniel-road (3,000.); J. Collier, builder, 25, St. Dominick-street, Truro.

Upper Penn.—School (4,390.); Mr. W. I. builder, Wolverhampton.

Ushaw Moor (Co. Durham).—Church; H. Wood, architect, The Bailey, Durham.

Messrs. Rutter & Sons, builders, Langley P near Durham.

Wakefield.—Additions to County Hall; George Crooks, builder, Henry-street, Wakefield.

Walsend.—Temperance hotel; Mr. F. Brown, architect, Peel-buildings, Newcastle.

Mr. T. Lumsden, builder, 84, Albert-jarrow.

Wanstead.—Special instruction centre, C bridge Park (600.); Messrs. R. Woolasto Co., builders, 40, Turners-road, Burdett-E.

Wokington.—Extension, Carnegie H Mr. W. B. Williams, Surveyor, Town E Wokington.

FOREIGN AND COLONIAL.

The Building Trade in Ottawa.

According to the report of Mr. J. B. Imperial Trade Correspondent at Ottawa, building operations during the past year have on a large scale, and would continue to be for a number of years to come, a fact of British manufacturing interests, particularly in the iron and steel trades, should be noted. It is probable that the business district of Ottawa will be largely rebuilt on a basis within the next decade, and the erection of many large business blocks are in contemplation. The Dominion Government has large projects under consideration, involving the erection of many buildings for the accommodation of the different departments of Government, and also in the direction of beautifying the city. During the next five years the Government will expend millions of dollars for these purposes. Some of the work which is being done, as is known, no British contracting or engineering firm have undertaken any construction contract of any importance in the Ottawa district for many years. Good opportunities are offered in this direction, and should be taken advantage of by British firms. Special attention is called to the new large building proposed to be erected by the Government and by private concerns in the city, which will involve the use of a tremendous quantity of structural steel. In one departmental building, which will shortly be erected, there will be no less than 7,000 or 8,000 tons of steel. British manufacturers do not seem to be capturing anything like a fair proportion of the import trade of Canada in structural steel. During the fiscal year ended March 1911, the imports of rolled iron or steel in beams, channels, girders, etc., from the United Kingdom amounted to 1,104,394 dollars compared with 3,685,000 dollars' worth imported from other countries. In iron and plates, too, British manufacturers supply a small proportion of Canadian requirements. In the construction and equipment of buildings of all kinds, it is found that there is great room for development.

Building Materials for British India.

Building materials, such as asphalt, cement, enamelled bricks, fire-bricks for boiler setting, terra-cotta, and iron pipes, are in considerable quantities (mostly from England) in British India. It is about 2,250,000 dollars' worth, 1,845,000 dollars' worth of iron from England; only about 40,000 dollars' worth from Germany, a fact to which the German technical expert in Calcutta calls attention of German exporters.

Building Trades in Berne.

These trades (reports the British Consul) a very good year in 1911, in consequence of the almost entire absence of strikes. Estimates of all kinds, however, are rather forces and money for the purpose of striking in view of the Landesausstellung (National Exhibition) in 1914. Numbers of new houses have been built in the city of Berne, numbers are undergoing repairs.

DON STREET DANGERS.

THE recent publication of statistics of the increasing number of fatalities due to pedestrians in the streets of London, renewed attention has been given to the question of appointing a central authority in compliance with the recommendation of the Royal Commission.

There are always have been in favour of appointment, for it is certain that the facilities now required and those that are gradually becoming necessary with the increase of population and the development of the districts cannot be adequately provided under the existing system of divided liability.

As predicted at the time when the Royal Commission was sitting, the recommendations of the body have been systematically discredited by successive Governments. Mr. W. B. Young has recently stated that "the Government not at present propose to introduce any giving effect to the recommendations of the Royal Commission," at the same time attention to the valuable investigations of the traffic branch of the Board of Trade.

As we have already had enough in the investigation. What we want is action, and it is precisely what cannot be expected of the traffic branch—an office having no powers to carry out any of its suggestions, no money to spend, no control over and no connexion with the police forces now engaged in traffic regulation. The situation as a whole once more demonstrates the incompetency of Parliament for dealing with urgent requirements and the incapacity of Governments, whether Liberal or Conservative, to undertake legislation that connected directly or indirectly with traffic.

So important as it undoubtedly is that an authority with ample powers should be established to undertake the reorganisation of traffic facilities and the control of traffic, we must remember that the creation of the most perfect system of roads and the establishment of the most effective methods of regulating traffic cannot eliminate the element of danger to so long as roadways are used exclusively by foot passengers and rapidly-moving vehicles.

The problem for the moment is to devise a method for reducing the loss of life and personal injury that have become so increasingly evident.

The solution of the problem at present lies mainly upon the Metropolitan Police. If traffic is regulated, and it is difficult to see that they can do much more than is being done to ensure the safety of the roads.

In straight open stretches of roadway, the Thames-embankment, a good deal of it is often required in crossing from one side to the other. After the pedestrian, the foot pavement next the river, has been dodged tramcars running contrary to the rule of the road and has evaded its own vehicles proceeding in the opposite direction, it is generally held up in the middle of the roadway by a flock of motor-cars and which seem to spring out of the ground, and has to remain more or less in this life until an opportunity presents a dash to the further pavement. To the reverse direction is an equally serious undertaking which also demands the presence of mind.

Interference of threading one's way across an important junction where traffic is rarely interrupted, as at Charing Cross, for involves risks still greater than those that by crossing an ordinary street, owing to many unexpected lines followed by travelling vehicles.

People who are mentally and physically alert, and are not liable to sudden alarm, negotiate any crossing in London with comparative safety. But careless, inattentive, nervous, and feeble persons run serious risks certainly ought to be reduced.

Nothing in this direction may be accomplished by more stringent control by the police, and still more could be done if the local authorities were compelled to facilities in the form of subways for crossing dangerous points, and to erect refuges wherever requisite in the form of streets and open spaces used by

Another improvement in which the police and local authorities might usefully participate would be the adoption of the gyratory system of traffic regulation at all important street junctions, on the lines proposed by Mr. Clyde Young in a letter in this week's issue.

This excellent method was suggested to the London County Council many years back by Mr. Holroyd Smith, and its application to various metropolitan street junctions was fully discussed about five years ago by Mr. W. Noble Twelvetrees in his Presidential Address to the Civil and Mechanical Engineers' Society, as reported in our issue of October 12, 1907.

Mr. Young has prepared two plans (page 45) following the model of those illustrating the address by Mr. Twelvetrees, one representing the confusing intersections of traffic lines resulting from the existing lack of systematic control, and the other showing the simplicity and safety that would be secured by establishing an oval route in the middle of the junction, around which all entering vehicles would pass until reaching the desired outlet.

This system is strictly in accordance with the dictates of common sense and could be tested practically at Ludgate-hill, Oxford-circus, and other places where circular areas already exist, without involving appreciable outlay, and just as easily abandoned if found unworkable.

Why the suggestion has never been adopted we are unable to say. The answer to this question is probably to be found in the hopeless conservatism of the official mind, and the lack of an authority empowered to initiate reforms in the regulation and control of London traffic generally.

THE STRAND ISLAND SITE.

By WILMOT CORFIELD.

DURING the lifetime of this generation no more sweeping and welcome public improvement has been made than that effected by the creation of Aldwych and Kingsway at the very heart of the capital's dominating domain, and in a region of the widest historical interest. Both thoroughfares have survived controversy and tribulation, both are facts of high accomplishment. For better or worse both have to be accepted and made the best of, and in the main London is thankful for the good they offer.

Critics abound to belittle the beauty of Kingsway, to doubt the fullness of the architectural strength evident in the putting through of a scheme of so comprehensive a conception. It has been said that the thoroughfare has no end at one end and two ends at the other end, and it is clear that a glance along its vista from either direction reveals a loss in dignity by reason of non-insistence on a stricter uniformity in the height of the buildings already erected. This defect may, however, be to some extent in course of time remedied by the raising of some of the lower elevations to the level approximating to that of the neighbouring structures. Land is cheap aloft, and top-stories spell profit and therefore prosperity, so that the hope may surely be indulged of something approaching more nearly continuity of sky-line instead of the present conspicuously irregular arrangement.

All Londoners know the "island site," hard by the spot where once rose, 100 ft. high, that very ancient thing, the Maypole of the Strand. All the world has seen it or read of that gaping gap hedged round by skirting-pale of appropriate severity just where the two grey churches sentinel the long world-loved stretch of street of momentous memories—wild and wonderful, compelling and repelling memories, ever recalling the story of the shadowy days of old resolute England in the making, shaping herself for her mission of to-day. Roman and Dane are gone, but just below to the left of Strand-lane, a declivity leading from one of the churches to the river, are the signs of an old Roman bath, and in the very name of St. Clement Danes there remains a suggestion of that fighting, coast-raiding race, fashioned to rule the sea, who became bone of our bone, and sib with us to conquest. The site for more than twenty years has lain open to the London skies, the weeds of a score of seasons have spread a fantastic cloak of restrained colour and straggled greenery above the ghostly evidences of still disinterred collarages and the ragged kennels of dead but famous London byways, chiefly to the edification of holders

of temporary vantage seats on the tops of gliding motor-cars. Here is the "island site," a huge wilderness of golden possibilities, hacked out of a London central desert of masonry exactly where the disregarded finger of opportunity has pointed during a working generation to the just demands of the future for consideration by the present.

The County Council pipes to speculators, but the speculators will not dance. The seed-time and the harvest have come and gone. The tin tabernacle of the Revivalist, the alluring poster of a French Syndicate, the corner pavilion enticing to the joys of a big glass palace, the seats of price for a coronation crowd, the giant hoardings of a well-discussed weekly, and a modelled object-lesson in the inequalities in the opportunities for voting of Parliamentary electorates have all in turn adorned or misadorned the "island site"; but still the County Council keeps on piping, while the Londoner yet to be, whose heritage it is ours to make or mar, is stepping up behind to take our place.

A great plague devastated London, and a great fire purged London, and a wise Wren saw the great finger of opportunity pointing. So Wren planned a new London on the charred ruins and was denied a hearing for his pains. We know the story well of London's scorn of Wren's finer judgment. The voice of the huckster prevailed, and London's majesty was dwarfed. The hagglar and the huckster are with us yet. It is the huckstering spirit that has left the "island site" for all these years to the tender mercies of the London weed and the London sparrow, and it is that same spirit which is striving to draw a close-packed line of bricks and mortar along the north side of the Strand (and the south bend of the Aldwych arc) from the Lyceum to the Law Courts, oblivious of the ever-pointing hand of opportunity and the folly of declining to hear the calling of the future.

It is not for the London lover in desire for the city beautiful to raise the spectre of money cost. It is for him to dream and to suggest, to keep alive the sacred flame dear to the wisher for beauty and reverence for the higher amenities of life. It is for the Gradgrinds, not the London lover to ever harp on the cost, to exaggerate its extent, and probably in the long run to lose in every way.

A few weeks ago the present writer urged in these columns the devotion of Smirke's doomed old Post Office in St. Martin's-le-Grand to the purposes of a postal museum. It has since been stated that the site alone is worth a million sterling. Accepting this statement as correct (for the sake of argument), why, then, use it for post-office purposes? Why, place a huge building upon it which would be equally of service in a less expensive street? Prominent sites should be kept for high-rented, attractive shops of rate-reducing possibilities, or else for churches, museums, picture-galleries, and other public edifices—ends in themselves, not means to ends. We do not cook our dinners in our drawing-rooms. Why, then, handle matter in million-pound City situations, when the same acreage can be acquired for perhaps a tenth of the money at an equally suitable distance from everywhere else? When Governments and democracies have been taught to grasp the full meaning of certain economic truths the possibility of a site for health-giving or for decorative purposes will be a factor taken into account before deciding upon its final disposal quite as much as its chance suitability for the less exalted destiny occasioned by the mere prosaic needs of a Government department.

No suggestion is now made for the turning of the whole of the still unappropriated "island site" in the Strand into a public garden, but the suggestion is made for the permanent retention of a large open garden or space in the middle of the ground between the wing occupied by the Gaiety Theatre and Marconi House and that taken by the Australian Government for offices. Kingsway should lead southward to King's-square, with, in the centre of the square, King's-square-gardens, and in the centre of the gardens the Edward VII. statue. The full fine vista of Kingsway would then be visible from the Strand, and the whole noble scheme of the County Council glorified and rendered worthy of the vast community for whose delight it serves.

There is no finer urban walk in the world perhaps than that from the Bank to the world bow shot of Hyde Park-corner by the most direct line available. In all its thrilling and splendid length of throbbing life only the little

green cases of the Cathedral churchyard and the Law Courts' side-garden exist. The staggering stupidity of this thing! Turn in thought to Paris, Vienna, or Calcutta, and grieve for what London, acting in the spirit of Wren's successful critics, has missed and is still lacking. But men grieve because fate has saved us from ourselves for twenty years. They fret lest a single inch of the "island site" should prove an unproductive asset yielding but little revenue; light and air and rest to eye and nerve count for nought, and so they go on building post-office warehouse accommodation for parcel-sorting people on million-sterling ground. They decline to see the finger of opportunity ever pointing to the waywardness of an obsession, and fling with both hands of their real wealth to winds that devour.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of the Westminster City Council on July 5 the following matters were dealt with:—

Paving.—It was agreed to repave the whole of the macadam roadway outside St. James's Palace with creosoted yellow deal blocks at a cost of 355*l.*, and to repave Dover-yard with creosoted pine blocks at a cost of 240*l.*

Surveyors' Institution.—Attention has been called to the fact that the addition to the Surveyors' Institution abutting on the new street north of the Middlesex Guildhall has been erected with a string course projecting 3 in. over the public way at a height of 5 ft. from the pavement; an explanation had been asked, and the Secretary had written expressing regret for the technical encroachment. It was decided to allow the course to remain on the Institution agreeing to pay an annual acknowledgment of 2*s.* 6*d.*, and to remove it on being given notice at any time.

Vincent-square and Rochester-row Improvement.—The Improvement Committee reported that the Ecclesiastical Commissioners have intimated that they are about to grant a building lease of a site at the north-west corner of Vincent-square, on which is to be erected a hostel for King's College (London), and that in this connection they are prepared to give certain land to the unnamed short street which runs into Vincent-square from Rochester-row and is now about 34 ft. 6 in. in width, making that street 40 ft. wide in its narrowest part and about 47 ft. wide at its widest part, and providing for a rounding off of the Rochester-row corner in addition. They also proposed to give up a small strip along the Rochester-row frontage in order that the new building might be rectangular. The area of land proposed to be given up is 1,352 sq. ft., and the proposal is based on the assumption that the City Council will take it over and be at the expense of the necessary paving and road work, with a reservation that, in the event of the property being diverted in the future to other uses (which is unlikely), the Ecclesiastical Commissioners have the right to make the usual vaults under the pavement and the right to make pavement lights.—It was decided to accept the offer with tenders to the Commissioners.

LEGAL COLUMN.

Trade Union Law.

The law relating to trade unions is so complicated that there appears no end to its ramifications. Judgment has recently been delivered in a case, *Zuby v. Warwickshire Miners' Association*, which occupied the Court on two days early in June.

The plaintiff, a checkweighman, and recently a member of a trade union registered under the Trade Union Act, 1871 and 1876, was applying to the Court for a declaration that a resolution expelling him from the union was *ultra vires*, and for an injunction restraining the union from acting upon it.

There was no question of benefits or payments, as his entrance fee and subscription had been returned to him, but he alleged that the deprivation of his status as a trade unionist would prevent him from obtaining occupation and earning a living.

The defendants alleged that the man had retained certain books and behaved improperly, and contended that by the rules they had power to expel a member; but with this portion of the case it is unnecessary for us to enter into details, as we are concerned only with a technical defence also raised by the union. They contended that under two statutes of the reign of George III., the

Unlawful Societies Act, 1790, and the Seditious Meetings Act, 1817, as the union was divided into branches, with separate jurisdiction and with delegates to other unions, the union was a criminal association, and the Court had no power to exercise jurisdiction. The Court held that subsequent legislation dealing with trade unions was inconsistent with such of the provisions of the above Acts as still remained in force, and therefore that the legislature must be deemed to have exonerated trade unions from their application. In the result, the Court declared the expulsion to be *ultra vires*, and granted an injunction. It is somewhat remarkable that a trade union should have raised a defence which, if it had succeeded, would have resulted in many of the trade unions being declared criminal associations. In view of the Trade Union Bill, which if it becomes law will extend the powers of the unions, it may be well to shortly consider some of the decisions. In the second Osborne case (the *Builder*, March 31, 1911), the Court of Appeal held that where a member was illegally expelled, the Court had jurisdiction to declare the resolution of expulsion *ultra vires* and to grant an injunction. In that case the rules of the society were held not to be illegal at common law as being in restraint of trade; but it does not appear that this finding was essential to support the jurisdiction of the Court on the other point.

When the rules are illegal in the above sense the Courts have no jurisdiction by reason of sect. 4 of the Trade Union Act, 1871, to enforce payment of benefits (see *Russell v. Amalgamated Society of Carpenters*, the *Builder*, April 5), or possibly whether the rules are in restraint of trade or not (see *Thomas v. Portsmouth A. Branch of the Ship Construction, etc., Association*, the *Builder*, April 26 last). Therefore, should the unions under the Trade Union Act, 1900, have political powers expel a member because he declines to subscribe to the political fund, it appears that the Courts can intervene and restore him to membership, thus enabling him to claim the status of a trade unionist for the purpose of obtaining work. But if the Courts cannot secure to him the benefits which the unions confer upon members. Thus the remedy is very imperfect.

In another case, *Gaskell and Others v. Lancashire and Cheshire Miners' Federation*, an appeal from the Court of the Chancellor of the County Palatine, at one time it appeared that an interesting point would be decided under the Trade Disputes Act, 1906. The plaintiffs were members of an Association which, it was alleged, the defendants' Federation desired to absorb. The plaintiffs alleged that threats had been made to them and their employers, that if the plaintiffs did not resign their Association the men in the mine would be called out, and that in consequence the plaintiffs had been discharged. Besides a denial of the allegations, the defendants, amongst other defences, pleaded the Trade Disputes Act, contending that any action taken had been in contemplation or furtherance of a trade dispute. The plaintiffs to this replied that as the defendants' union had a Parliamentary franchise it was held to be illegal in the case, *Osborne v. Amalgamated Society of Railway Servants*, they were not a trade union under the Trade Union Acts, nor entitled to rely upon the Trade Disputes Act. If there were no trade dispute, the Court would have had to decide the point which has been in doubt since the decision in *Vacher & Sons v. London Society of Compositors* (the *Builder*, April 12), as to whether sect. 4 of the Trade Disputes Act is general in its terms or is limited to torts committed in contemplation or furtherance of a trade dispute. The Court of Appeal, however, affirming the Court below, held that there was a trade dispute—i.e., a dispute as to whether men not members of the Federation should be employed at the colliery. This brought the defendant Federation within the Act without question, and the Court held there was no substance in the point about the illegality of the Parliamentary Fund.

The action was also brought against one of the officials of the Federation; but the Court in *Appel* held, affirming the Court below, that there had been no threats, and that the words complained of were really a statement that, having regard to the feeling among the men, the pits would be stopped unless the non-union men were approached at their houses. The action was held to have been taken in contemplation of a trade dispute, the protection of sects. 1 and 3 also applied. In this case it should be noted that the men had given due notice to determine their contracts, and had been guilty of no breach of contract, so, although it is to be regretted that union men object to work with non-union men, the case was not a strong one to bring before the Courts.

The Highways Act.

By sect. 23 of the Highway Act, 1835, provided that "no road or occupation made or hereafter to be made by and expense of an individual or private body politic, or corporate, nor any way or hereafter to be set out as a highway or housepath in any award of commissioners under an Inclosure Act, deemed or taken to be a highway," rep by the inhabitants at large, unless the body politic, or corporate proposing to do such highway to the use of the public have observed certain formalities and obtained a certificate of two justices.

A decision has been given upon the meaning of this section in the case of *Osborne v. Walton-upon-Thames District Council* (the *Law Reports*). Under the Private Works Act, 1839, the Council had resolved to make up a private street, and an agreement had been made on the plaintiff's behalf, but the plaintiff objected to the apportionment alleged that the street was a highway of a person who developed it as a private estate, causing other roads to join the highway, which had been reserved in previous years, and at that date it admittedly had a highway. It had been reserved as a highway in 1856, and the Council had found that the street was not a highway before 1835. It was contended that the section of the Highway Act only applied where there was an intentional dedication, a where dedication occurred by public authority, no application of the Divisional Council was made, and held that the section applied, although there was no at what precise date or in what

stances the way had become a highway or other words, the section gets rid of the presumption that a highway is repairable at large, and affirmative evidence of the fact must be offered.

LONDON COUNCILS.

Acton.—The following plans have passed:—Extensions to works, Church-street, Acton Green, for Messrs. E. Vignoles; transforming station, Acton Green, for Messrs. E. Vignoles; printing works, Acton-lane, for Augener, Ltd.; Great Marlborough-street.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name) those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

*. Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

HARROGATE.—For erection of a new garage for the Directors of the Harrogate Hydropathic Co., Ltd.:—
Walter Richardson, Outwood, Wakefield*, £1,308 2

[All trades included.]

No. 1 "BB."

This latest type of "Ideal" Sectional Boiler combines all other advantages of the "al" construction with the greatest facilities for firing and clinkering, provided the new double doors which give free access to every part of the fire and grate.

No. 1 "BB" Boiler showing new double doors.

For warming houses, flats, hotels, shops, public buildings, etc., by hot water or steam.

Ideal "BB" Series Boilers are at present made in sizes for 710 to 1,435 feet of 4-inch pipe—can be supplied with smoke outlet at front or back—are specially suitable for horticultural work.

Full particulars, prices, and measurements gladly sent on request.

We supply Valves, Tools, Registers, Ventilators, Pipe Fittings—all accessories required for Low Pressure Hot Water and Steam Heating.

Catalogues gratis and post free.

THE PORT OF LONDON COMPETITION.

NO competition of recent times has evoked more attention and interest among architects than that just decided for the Port of London Authority. The opportunity given to design a building for purposes so closely connected with the commerce of the greatest city in the Empire, the unique situation of the site next to Trinity House and the Tower of London, and the very difficulties of the subject have attracted an unusually wide response from the architectural profession.

The problem to be solved was rendered exceptionally difficult one by the fact that no specific portion of the irregular angle lying between Trinity-square, Fenchurch-lane, and the old gardens was allotted to the new buildings, competitors having to decide themselves on what portion of the new offices were to be placed, and also to suggest lines of development for the remainder of the site acquired by the Port of London Authority. In fact, with the exception that the new offices were to face Trinity-square and to contain

certain specified accommodation, and to be built within a given cost, no information was given to competitors. The irregular nature of the present frontages to Trinity-square, the poor design of all buildings surrounding it, with the exception of Trinity House itself, formed additional difficulties keenly felt by those who were wishful to solve the problem in accordance with modern principles of town planning.

Nowhere, probably, could a worse example of the old haphazard, irregular layout of streets and frontage lines be found.

A suggestion contained in the original conditions and repeated in the instructions to selected competitors has proved a serious stumbling-block over which many schemes have met with shipwreck. This was that the general idea should be that of a large hall in which as many of the principal departments as possible should be grouped. Of these departments the Port Rates Office was to be placed in the most accessible position. In most of the designs submitted this suggestion has been adopted, and the success of the winner is largely due to the fact that he has thought out the reasons underlying

the suggestion, while entirely abandoning it as the root idea of his design. This may be regarded as an instance of one of the many reasons why competitive conditions should not contain "suggestions," but only binding requirements, and as few of the latter as are absolutely necessary.

It is impossible and unnecessary in most cases for an assessor to plan out the subject himself, and without this it is very difficult to ascertain whether a certain suggestion should be made or not. Had the suggestion in this case been a binding condition, it would have excluded what is unquestionably the most masterly solution of the problem; but the winner alone has had the courage to disregard it.

We may say at once that there can be no question that the best design has been chosen, whether from a point of view of plan, which is masterly, and should, we imagine, need little or nothing in the way of modification, or of architectural treatment, which is dignified, architectural, and logical. The scheme is one which will, when executed, be worthy of any city in the world.

The plan forms a square with the angle facing Trinity-square cut off, and on this

angular front is placed the principal entrance to the building. On the three outer angles of the square are entrances from which diagonal corridors lead to a central circular hall, which forms the Port Rates Office. In convenient positions off these corridors are secondary staircases. A circular public space round the Port Rates Office forms a short and convenient approach to every part of the ground floor, communicating at eight points by corridors or lobbies with every part of the ground floor. Round the outer sides of the building are placed the Dock and Warehouse Offices and the Chief Collector's and Deposit Offices. These latter are divided by columned screens with counters in convenient positions. The principal entrance, occupying the whole width of the front to Trinity-square and flanked by the two principal staircases, is finely and symmetrically planned. The Board-room occupies the Trinity-square front on the first floor, and is flanked on the two adjoining sides of the square by the Committee-rooms and members' accommodation; the two remaining sides of the square are divided into departmental offices. The lavatories on upper floors are very skilfully arranged, in the three pavilions which mark the outer angles of the square corresponding to those which contain the principal stairs on either side of the Trinity-square front; the lavatories for the ground floor are placed in the basement or adjacent to the official staircases. The basement, with its diagonal corridors, is admirably planned for purposes of easy communication, and is well lighted in every part.

The elevations are very dignified and simple in treatment, the columned front to Trinity-square giving emphasis and relief to the simpler treatment of the adjoining fronts. The pyramidal centre feature is well considered and proportioned, and forms a dignified finish to a remarkably consistent and dignified conception. The circular top-lighted Port Rates Office is a refined and interesting piece of design, and we have little doubt that in Mr. Cooper's hands the building will rank among the greatest achievements of modern architecture in this country, and will stand comparison with some of the best American and French design. (See Plates)

As will be seen from the block plan, reproduced below, the remainder of the site is well laid out for purposes of development and for the production of revenue.

Messrs. Lanchester & Rickards submit a scheme which is finely conceived and well carried out, but in which the desire to combine the departments on the ground floor into one hall has involved the authors in difficulties, which are avoided by Mr. Cooper's solution. The lay-out is fan-shaped, with the short side to Trinity-square, the radiating sides fronting on Savage-gardens, and a new street to be formed roughly parallel to Byward-street. The back part of the building forms a long and well-designed curving front.

Internally a broad hall runs from back to front, broken by an elliptical feature, the centre of which intersects with a curved top-lighted hall, which forms the public space of the Port Rates, Chief

Collector's, Charges, Chief Superintendent's, Canvassing, and four smaller departments. The disadvantages of the arrangement (which is in close accordance with the suggestions made to competitors) is obvious by a comparison of this with the winning design. The Port Rates Office is, in such an arrangement only approached by two entrances, and is situated at the back of the block. The Deposit and Post Offices immediately adjoin the main entrance, and beyond the entrance hall are placed the two principal staircases. A third staircase is placed at the back entrance beyond the elliptical hall. Unfortunately, such a plan necessitates a large number of irregularly shaped rooms, which, however, may be considered of smaller importance in this than it would be in many buildings, as the requirements are largely purely utilitarian.

The treatment of the remainder of the site is skilful, a large area being left rear of the new offices, but the lay-out destroys something like one-quarter of the valuable frontage to Seething-lane. Architecturally the scheme is both simple and pleasing, free from ostentation and very sober and dignified. A range of pilasters runs round the entire block emphasising the ground and first floors, surmounted by a simple stone attica story above which is a stone balustrade and mansard roof with dormers. The central feature is worked up very happily, and its receding stages are skilfully proportioned and well designed. There is a unity and harmony about the whole design which is characteristic of the work of Messrs. Lanchester & Rickards, among whose best efforts it will rank. We could have wished that the detail drawing had been defined, as the full effect of the design can hardly be adequately estimated without them.

Messrs. Bowden & Wallis produce a striking design on very different lines, the Trinity-square frontage being squared, and the Port Offices occupying a rectangular lining up with Savage-gardens, and running through to Crutched Friars. In this design the authors have tried to carry out the suggestion of a large hall containing the departments, the central portion of which forms an immense hall 100 ft. in height, top-lighted, round which are arranged the remaining accommodation placed on four floors with an upper floor above the roof of the hall. An entrance hall at either end gives access to a wide vestibule corridor, at either end of which are placed the four main staircases, and beyond this corridor is the large hall previously mentioned. At either side of the central hall are corridors cutting into the vestibule corridor at either end, and these outer blocks and corridors repeat on each floor.

The Port Rates Office occupies a strip on either side of the hall, with a broad public space in the centre. It is the treatment of this office, divided into two portions and lighted from an immense height, which forms the doubtful feature of the design from a point of view of plan. The scheme is generally finely conceived, but the detail and features are on an immense scale, and would, we imagine, need much reconsideration to render such a treatment satisfactory. The sides of

Accepted Design : Block Plan. By Mr. T. Edwin Cooper, F.R.I.B.A.

central hall, in particular, show evidence of want of consideration and in designing. The elevations are conceived, but here again the detail is somewhat coarse and heavy, the ship surmounts the tower being something like 30 ft. high, and every part of the plan being on an equally enormous scale. But in its main proportions there is no fault to find with the design, the Trinity-square being on dignified architectural lines.

Ernest Wray has produced a plan based on a general acceptance of the present frontage to Trinity-square, the offices, unlike the winning plan, occupy a rectangular block, having somewhat awkward sites for development, terminated at three points by acute angles. This, we should imagine, apart from any question of the details of the plan itself, place it out of court. A vestibule leads to a Salle d'attente, and this again to the staircase beyond which are placed the Dock Warehouse Offices and Port Rates Office, which occupy the back part of the block, and from which access is obtained to the back entrance. The Chief Inspector's and Deposit Offices are placed at the front of the building on either side of the entrance.

The centre of each side of the block is reached by subsidiary entrances and staircases. The upper floors are well and truly laid out, and the lighting of the various rooms is everywhere good and efficient. Externally the building is treated quietly and simply, a low tower surmounting the principal staircase, and a colonnade marking the front to Trinity-square. The design shows traces of a fresh feeling, and is quiet and unostentatious, but its author has hardly risen to the occasion or shown an adequate sense of the importance of the subject.

Mr. Reginald Truelove has sent in a plan in which the offices occupy a rectangular block lining up Savage-gardens in the same manner as that of Messrs. Bowden & Wallis. The irregular frontage along Savage-gardens is, however, retained, which seems a marked defect in planning a monumental building. The departments are planned in two main halls, divided by a transverse entrance hall and staircase, while the subsidiary entrances are those facing Trinity-square and Crutched Friars. The upper floors are fairly well laid out and lighted, but there is an absence of a grand conception about the scheme, which is somewhat commonplace, nor is there an immensely lofty central tower, which defines the narrow front to Trinity-square into two portions, a happy conception.

Mr. Robert Atkinson submits a scheme for its main idea an octagonal plan, around which the chief departments are planned, which is entered from Trinity-square and from two entrances in the rear, which are diagonally placed. Like everything Mr. Atkinson does the design is characterised by great care and refinement, but we do not feel that it represents him at his best, the design of the colonnade across the main entrance being especially unhappy.

In the whole, we may congratulate

the Port Authority on obtaining some excellent designs, and we hope to reproduce the whole series in due course, but in this issue we confine ourselves to giving the winning design. While we consider it to be one of the most satisfactory solutions of a difficult problem that we have ever had to record, we hope that assessors will in the future be more careful about making suggestions, which undoubtedly influence competitors and often prevent them from finding the most satisfactory solution of a given problem.

NOTES.

Winchester Cathedral Thanksgiving.

By a happy coincidence the impressive and dignified ceremony which was performed in Winchester Cathedral on Monday last took place on St. Swithin's Day, exactly eight hundred and nineteen years after the transference of the shrine of St. Swithin into the New Minster. Their Majesties the King and Queen showed their interest in the event, and gave it a national importance by attending in person. The great Cathedral was filled with a vast congregation, among whom dignitaries in Church and State, celebrities in arts and science, and representatives of all ranks of society were numbered. All were drawn there by the irresistible call of thanksgiving that one of our most beautiful and historic buildings has been saved—at any rate, for a time—from the dangers which were undermining it. "As flowers carry dewdrops, trembling on the edges of petals and ready to fall at the first waft of wind or brush of bird, so the heart should carry its beaded words of thanksgiving." In studied words the Archbishop of Canterbury told from the pulpit the story which forms the subject of one of our articles in this issue. He bore tribute to the skill of Mr. T. G. Jackson, R.A., and Mr. (now Sir) Francis Fox, the architect and engineer respectively, upon whom the burden of the toil has fallen, no less than of that of the contractors and the workmen who have been engaged upon the actual execution of this difficult work of salvation, costing no less than 114,000*l*. That the King should have honoured not only those responsible for the methods pursued, but also the actual workers, is, we think, full of significance; and in personally congratulating the diver, Mr. W. K. Walker, upon whom so much depended, he was recognising how important a part the workman plays in undertakings of this nature. In no age prior to our own, we think, have the resources of science made it possible for substructural work to be carried out comparable to what has been achieved at Winchester.

The Public Press and Architecture.

WE should like to offer our congratulations to our contemporary the *Daily Chronicle* upon a recent notice of modern architecture, entitled "In London Streets," from the pen of Mr. Lewis Hind. In our last issue we deplored the lack of interest displayed by the public towards architectural effort, and advocated the need of intelligent outside

criticism. It is seldom that the daily newspaper mentions modern architecture, and when it does its opinion is entirely guided by the prestige of the architect. Thus we even permitted ourselves to say that the professional art critic was more at home in the gallery than in the street. Limited to specialists as architectural criticism now is, it revolves in an ever narrowing circle. But a little while since and Wren was the master. Then it was Michelangelo. To-day it would seem to be Pythios. Enthusiasms wane just when their developments are becoming interesting. This was eminently so in the instance of the middle period named. Now, as Mr. Hind observes, a Greek Renaissance is evident. But if Pythios was the architect of the Mausoleum, he was also one of the prominent sculptors employed. The modern designer is entering the lists with one arm tied behind him. In the arch on Constitution-hill we may now see a completed piece of classic architecture crowned by the Adrian Jones' Quadriga. It has no doubt been criticised, but, in our opinion, the instant effect is splendid.

Cromwell House, Highgate.

RUMOURS have appeared of late in the daily Press that the fine oak staircase of this historic house was likely to be transported to America. The danger proves happily not to be an immediate one. The sixty years' lease was acquired in 1869 by the Great Ormond-street Hospital for Sick Children. Much money has been spent from time to time on adapting the premises for the purposes of a convalescent home, for which they are not particularly well suited. The committee of the hospital are, therefore, not disposed to turn out without adequate compensation, though they would prefer a more modern building farther from town. They are fully aware of the historical and artistic value of the house, which they have endeavoured to preserve, and have thrown out a suggestion—in a letter to the *Times* of June 24—that an effort might with advantage be made to secure the house for some public purpose. It has been placed, it may be mentioned, on the Middlesex County Council's list of buildings that should be preserved. In spite of its present name Cromwell House was not the Protector's property, but was built for his son-in-law, General Ireton. It contains much good oak panelling of the period, as well as the remarkable staircase, which, with the architecturally treated doorways opening on to it, is of an elaborate Jacobean character. Nine of the thirteen newels are surmounted by statuettes 1 ft. 7½ in. high, representing types of Cromwellian soldiery.

The Abuse of Advertising.

VISITORS to the French Riviera and the "beauty spots" of France will welcome an announcement contained in the *Times* that the Chamber of Deputies have passed a Bill placing a tax on large signboards. Boards under six yards in length, it is stated, are to be taxed at 2*l*. a year the square yard, and the tax rises in proportion to the size of the posters. For some time past advertisements have been taxed in France by means of a stamp, but this small impost

Winchester Cathedral (1795).

From a Sketch by J. M. W. Turner, R.A.

has not served to check the abuses of advertising; the proposed tax on advertisement hoardings is intended apparently to be prohibitive, and this means of checking unsightly advertising seems preferable to the procedure by by-laws which we are so dilatorily pursuing. A Chancellor of the Exchequer searching the country for hen-roosts, and at the same time stamp collecting, might do worse than cement the *entente cordiale* by adopting this Bill now passed by our French neighbours. The revenue collected might be small, but the end to be attained would be excellent, and the tax could be collected far more easily than insurance contributions.

Our Regent's Quadrant Competition.

OUR readers will remember that Messrs. Swan & Edgar, anxious to show their interest in this competition, offered some practical appreciation to the author of a thoroughly suitable design, when obtained, for the rebuilding of their premises. From the letter we publish in another column, offering to every prizewinner in the competition a premium equal to that already awarded, we gather that a thoroughly suitable design from their point of view has not yet been produced. "As there will probably be much delay before this conclusion can be arrived at," they offer in the meanwhile this proof of their continued interest in the matter, which, we imagine, will be found acceptable by those most nearly concerned. Much delay there probably will be, as, even if any one design had been entirely satisfactory to

Messrs. Swan & Edgar, the Office of Woods and Forests has also to be satisfied, and, if the official mind is firmly convinced of the entire suitability of the Piccadilly Hotel façade, it will no doubt take time for other ideas to percolate.

WINCHESTER CATHEDRAL: PAST AND PRESENT.

THERE is a great difference between modern and older methods in the restoration of ancient buildings. The XIXth century, with its cocksure and limited vision, had no qualms about it. Almost every mediæval building of importance was restored then more or less, but never without loss of some of its time-honoured beauty, and the honourable wounds wrought by the passage of the centuries, the furrows delved in beauty's brow by time were nicely covered or smoothed out. From how many ancient buildings does one turn back with a sigh of regret? The hand of the restorer is visible everywhere, violent, iconoclastic, ruthless. But it is a pleasanter task to speak of Mr. T. G. Jackson's work at Winchester Cathedral. We hope it signalises the advent of new methods—methods at once sympathetic and scientific in the repair of mediæval structures. Now that his work is finished the difficulties are apt to be overlooked. But they were there nevertheless, and have only been overcome with patience and understanding. Mr. Jackson's account of the work of reparation reads almost like a story.* It is therefore our intention to quote largely from it, but before doing so it may be interesting to give a brief sketch of the history of the cathedral of Winchester.

* "Winchester Cathedral." An account of the building and of the repairs now in process. Transactions of the St. Paul's Ecclesiastical Society, 1910. By T. G. Jackson, R.A.

Winchester Cathedral shares with St. Albans the reputation of being the longest church in England. The former is in reality a few feet longer, for from the interior of west wall to the inner face of the east wall the Lady Chapel is 526 ft. 6 in., whilst the latter measures 521 ft. 1½ in. At Winchester, too, the proportion of the porches westward is greater. Both possess a long line of unbroken roof which, while being impressive from its very simplicity and size, has somewhat of the picturesque effect usually associated with mediæval buildings, which Winchester furnishes so abundantly in the interior. Indeed, few things in English surpass the beauty and variety of the presbytery. It is interesting to consider for a moment the methods of restoration adopted in these two fine buildings. In the case of St. Albans so much rebuilding and designing took place that the result rather a hotch-potch of XIXth-century and older Gothic which only the innate nobility of the original building could save from utter ruin as a design, whilst Winchester remains, as far as outward appearance is concerned, much as it was before, save for steel rods and bolts and a range of buttresses on the south side of the nave being the evidences of all that has been done in the last seven years. The structure has been strengthened in such a manner that it may still be considered to be the epitome of architectural development in England at a time when its reparation became necessary. Those qualities of native ingenuity which we associate with our mediæval buildings find in it noble expression. The march of centuries, that splendid pageantry of style from the calm strength and grandeur of the Norman to the last light and graceful phase of the Gothic, can nowhere be seen to better advantage. But it is not merely the fabric itself which is beautiful. It is a treasure house of all the delightful accessories

we can only conjecture faintly the form of the Saxon cathedral. "Of the greater conquest churches no example has survived, and we can only guess at their general appearance. They were subjected to two great waves of destruction. First, the Danish invasions, when churches and monasteries were destroyed and jewelled indiscriminately; and, secondly, the much more thorough destruction for the purpose of rebuilding which followed the Norman Conquest. The coming of the Normans in the exultation of their triumph were fired with the ambition of surpassing the architecture of the subject Saxon, but of eclipsing in splendour and grandeur the stately fanes which

De Lucy's building probably finished eastwards with three chapels at the ends of the

This briefly traces the history of the cathedral from its foundation in 1079 to 1528, a period of over four centuries, the length of time it took to form Winchester Cathedral as it is to-day. A long period, but certainly one worth preserving in this

Winchester Cathedral: Plan of Eastern Part Showing Extent of Underpinning.

Carried out by Mr. T. G. Jackson, R.A.

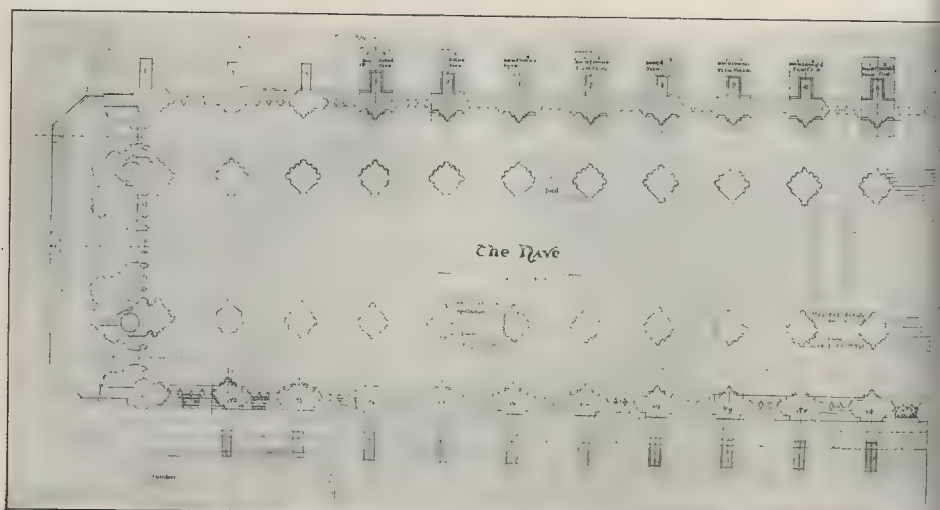

its manifold expression—that of stone and wood cut and carved by generations of men striving with their whole might to embody an aspiration of the soul.

It is necessary now to explain the various causes which prompted those in charge of

the fabric to undertake the extensive repairs which have just been completed.

"If we banish in imagination from our view the whole city of Winchester—Cathedral, Castle, College, and the town itself—and try to recover the aspect of the bare site,

we should see a marshy bottom lying between chalk hills, through which the River Itchen wound its way. Over a deposit of considerable but unknown thickness, below which is probably chalk, formed a bed of peat, varying from 3 ft

Winchester Cathedral: Plan of Nave Showing Extent of Underpinning and New Buttresses.

Carried out by Mr. T. G. Jackson, R.A.

to 7 ft. in depth, on the top of which, sometimes also below, is a deposit of silt, washed down from the surrounding hills. From the existence of peat in quantities it may be imagined that was at one time a kind of bog where a greater part of the town now stands."* yet curiously enough the Romans clung to the town in the marshy bottom when they took it from the primeval inhabitants. Saxons were equally tenacious and to the same site when they turned a *Venta* into *Wintanceaster*, building one but two great churches. The Minster was moved in the reign of King I. to higher ground without the walls. Bishop Walkelyn chose to retain the site for his new cathedral and laid the foundation of subsequent disaster. De Lucy's work pushed out towards the east in the direction of the river, and it was here that Mr. Jackson's attention was first directed when he was consulted by the Dean and Chapter in 1905. Mr. Jackson writes: "The point where De Lucy's building of the thirteenth century joined the cross wall existing in the crypt, which marked the site of Walkelyn's choir, a rupture had taken place."

The whole of De Lucy's building had sunk eastward about 5 in. if not more, and had also sunk into the soft ground, though not equally, for, the ground being the farther you go eastwards, the more it sank more than the western part, at the courses of the wall described a curved line, lower at the eastern end than at the western by more than 2 ft. This settlement naturally caused serious distortion of the vaulting. The walls, especially the south side, had bulged outwards, the inclination from the perpendicular being in part as much as 2 ft. in 44 ft., and in other places an inch in a foot. The settlement thus disturbed brought an unfair pressure on the buttresses against which the vaulting ribs converge, and the effect was seen to tear them away from the curtain wall by a fissure through the next window on the south side and to thrust them outwards. The vault thus released by the spreading of the side walls sank, the ribs lost in many places their arch construction, taking a straight line where it should have been a curve; the panels cracked and bulged, and the whole would have fallen had it not

been bolted up with iron straps to timbering in the space under the roof."

been bolted up with iron straps to timbering in the space under the roof."

Before anything could be done it was necessary to ascertain the cause of failure, whether it was defective foundations or inefficient buttresses. A hole was therefore dug on the south side of De Lucy's building, until about 10 ft. deep the foundations were reached. They rested on a bed of fairly solid chalky marl, and were built upon a raft of beech trees. This marly stratum was 3 ft. thick. Going lower, it was not until a depth of 16 ft. was excavated that the solid gravel was found. What probably happened when De Lucy was building was this: He came upon water 10 ft. down, and being unable to cope with the water difficulty hit upon the expedient of the raft. Under this in time the soft ground yielded, causing the walls to sink and break away from the older building west of it. There were therefore two causes of mischief to be counteracted, (1) defective foundations; (2) the thrust of the vault. The work of underpinning was entrusted to Messrs. John Thompson & Son, of Peterborough, with Mr. Edwin Long (who has been constantly with Mr. Jackson since 1876) as clerk of works. After shoring up the south wall and centering the vaulting, they commenced to underpin the walls. They started from the south-east corner in sections 4 ft. wide, which went diagonally through the walls. But after the first three sections were completed a fresh complication arose. These sections had to be kept dry by means of a centrifugal pump. Pumping is attended by the danger that it may draw fine sand or gravel from the subsoil. At the fourth drift or section silt was found below the peat which pumping would be sure to disturb. It was then, on the advice of Mr. Jackson, that the Dean and Chapter consulted Mr. Francis Fox, the civil engineer, who recommended the employment of a diver, thus making it possible to proceed without pumping. The underpinning now proceeded as follows:—

The sections were opened by the builder until there remained but 18 in. of peat above the gravel. The peat being impervious sealed up the water in the gravel. Then the diver went down and took away the last obstruction, when the water immediately filled the hole to a depth of perhaps 10 ft. The sections were 4 ft. 6 in. wide by about 20 ft. long, and the diver had to lay a foundation in this tunnel without light. Bags of cement were lowered to him and laid side by side, and then cut open. The whole set in a few hours as hard as a rock and sealed the water down again. The whole was then pumped dry, and upon the foundation of sacks of cement the builder raised his wall. At first this was built

with loose cement, but it was more expedient to use large blocks of cast cement. When within about 3 ft. of the wall overhead the underpinning was taken up in brickwork, and pinned up to the old work as the men came forward.

Several of these sections were in progress at the same time at different parts of the building, and were allowed a fortnight to settle. The work has been done so well that the old walls settled scarcely at all. The cracks in the superstructure were bonded across with long pieces of York or Purbeck stone and all the interstices filled with a thin grout of Portland cement. For this purpose the Greathead grouting machine was used, which by means of compressed air forces the grout with considerable violence, which can, however, be accurately controlled, into every hole and cranny. To quote Mr. Jackson again: "The vaulting of De Lucy's building was so seriously cracked and dislocated that the whole of the south aisle vault had to be taken out and reset, and the ribs, which had sunk as much as 16 in., and lost their arch construction, were brought to the proper curve for doing their work. The vaulting of the central aisle was not so bad, but needed grouting and partial repair. That of the north

Section through Foundations of North Nave Aisle.

aisle was in a dangerous state, one stone having actually fallen, and though it was not all taken out like the south aisle vault, a great many of the panels were partially reset, having bulged below the proper line of arched construction. No attempt was made to restore the walls to the upright—their cracked and dislocated condition forbade it. They therefore lean as before, but they are relieved of the thrust of the vaults by the iron ties from side to side of the church, an alternative which seemed preferable to that of increasing the projection of the buttresses and so altering the design." The external walls of the Lady Chapel and De Lucy's building were thus underpinned to prevent them not only from sinking, but from sliding eastwards. Mr. Jackson thinks that it will now be impossible for the pillars to move in any direction but vertically downwards, and he assumes that the layer of peat on which the walls of the crypt—which carry the pillars—are built is sufficiently incompressible to carry the dead weight of the arcades and superstructure.

The condition of the Norman transept was even more serious than that of the Early English building. In some places daylight could be seen through the fissures in the side walls. Again it was the foundations that were in fault, for although they had been taken deeper than the later building they still did not reach the gravel. The builders dug out the marly layer and part of the peat and filled it up with loose chalk and flints until they were able to build in the dry. These imperfect foundations all gave way, and the great gables literally parted from the bulging side walls—the south gable, indeed, overhanging its base some 4 ft. 6 in. The transepts have both been well grouted and underpinned. But the misfortunes of the cathedral did not end here, for the condition of the nave aisles was found to be almost as bad as the other parts. When the nave was ingeniously changed into a Perpendicular building, Wykeham did not

trouble to take down the outer walls and rebuild them. He merely cased the north wall inside and out and the south wall only on the inside. Also the buttresses he built on the north side were hung on to the building, and instead of supporting it helped to pull it over. The foundations, as may be seen in the section given herewith, were not taken as far down as the Norman work. Both aisle walls leant outwards, and the vaulting of the aisles showed themselves to be slowly moving. This has also been underpinned and grouted, while the south nave aisle has been strengthened by the addition of ten new buttresses, seen on the view reproduced on this page. The history of the cathedral of which we have given the briefest outline would seem to have been one of disaster. It was built on a wet compressible

soil, and the settlement almost certainly commenced at once, and has been going on ever since. Never before has such a large and difficult work of underpinning been undertaken. It is now happily brought to an end for the present—the walls stand as it were, on solid rock, saved for the benefit of future generations of men.

THE WALPOLE SOCIETY

JUST over a year ago the Walpole Society was founded "for promoting the study and appreciation of British art," and we are given the opportunity to welcome the annual volume of the newly-constituted body. It may be said at once that the quarto volume before us, produced mainly by the Oxford University Press, is of a character which promises well for the future of the Society and subscribers of the guinea for members may be congratulated on the handsome addition to their libraries obtained at so little cost, and with the knowledge that their individual has made the scheme possible. The publication of this evidence of activity should bring accessions to the ranks of the Society, and the Committee, of which the Earl of Lytton is President and Sir Charles Holroyd is Chairman, consists of leaders of artistic thought, and seems certain that the annual publications add considerably and in an attractive way the existing information on every phase of British art.

The range of operations is from the Xth century onwards, and the Walpole Society plunged into the depths of history with commendable courage. Knowledge of early architecture is more complete than of painting, sculpture, and of the other arts. For this reason, perhaps, Professor Edward S. Popham takes for the subject of his essay not a purely architectural theme, but the incidental on English medieval figure sculpture. The article is illustrated by work in Chichester Cathedral, Wells Cathedral, Lincoln Cathedral, Westminster Abbey, King's College, Cambridge, and elsewhere.

Nicholas Hilliard's "Treatise Concerning the Arte of Limning" is printed for the first time from a manuscript in the library of Edinburgh University. Mr. Philip Norman, LL.D., writes an essay on the miniature painting of the period, and the whole contribution will be ready for study. Similarly the articles on "London Westminster Painters in the Middle Ages," "Professor Lethaby," and "Reynolds's Portrait of Keppel" by Mr. Leonard O'Malley and Mr. C. H. Collins Baker, are authoritative researches which add something to published facts.

Lastly, the Hon. Secretary of the Society, Mr. A. J. Finberg, describes, with the help of some very interesting illustrations, the Isle of Wight Sketchbook, dated 1795, one of the many Turner relics in the possession of the National Gallery, none of which are available, apparently, for general reference. Mr. Finberg's knowledge of Turner's sketches is unrivalled.

[Photo. by W. T. Green, Winchester.]

Winchester Cathedral: South View of the Nave. Some of the Ten New Buttresses.

book on the subject is a mine of information. On his way to the coast Turner was impressed by the beauties of the Cathedral and made several studies. These, reduced from the collotype plate of the Walpole Society's volume, is reproduced as an appropriate illustration to the work of Mr. T. G. Jackson, R.A., and Francis Fox in making the cathedral.

It has been written to show the breadth of the work of the Walpole Society, the progress of which we shall watch with interest.

EXHIBITIONS OF ETHIOPIAN AND EGYPTIAN ANTIQUITIES.

ETHIOPIAN archaeology proceeds apace. At the present moment there are no less than three exhibitions being held in London of the results of recent excavations. The results of civilisation of ancient Egypt and its farther afield are becoming more and more clearly fixed—their architecture, their arts and crafts, their manners and customs. It would be absurd to postulate that all has been shown at these three exhibitions of equal importance or throw fresh light on the history. The spade work of the excavator may be always interesting, but the point of view of historical research often yields very minute results. Egyptian tombs have given up their dead, mummies have been disentangled, a very small, if any, real addition to the knowledge of ancient humanity which has not previously been ascertained. With the hope, being unduly sentimental, that in some cases that these small fragments of the grave had remained undiscovered. But the excavator must proceed with his work, the thirst of the anthropologist must be sated, and we dare say that the most valuable discoveries have been made in ground which promised to yield little that was not within the compass of previous knowledge.

The exhibition at Burlington House of antiquities discovered at Meroë in the Sudan (under the auspices of the Institute of Archaeology, University of Liverpool), is doubt the most important in an architectural view of the three exhibitions. Professor Garstang the progress of excavating a Royal city whose general site was fixed a few seasons ago has been considerable, and added largely to the knowledge of the plan of the city at various eras, as well as to the disposition and form of many of its more important buildings, while many specimens of sculpture and of the craft of the highest interest. It must be said that Professor Garstang is fortunate in his site. His find last year of the bronze

Excavations at Meroë: Plan of Palatial Building with Foundations laid Bare.

head of Augustus, now in the British Museum, has added directly to the artistic treasures of the nation. The history of this Royal city is comprised within fourteen hundred years, from 700 B.C. to A.D. 700, so that for this type of excavation it may be said to be comparatively modern. To the first date belong the great buildings in stone, the walls of the city, the original portions of the Royal palace, and other buildings whose position has now been definitely located. In this age Egyptian motives in art were still predominant in Ethiopia. The next period, about the IIIrd century B.C., was distinguished by the supplanting of Egyptian ideas by Greek; the solid stone wall had given place to walls faced with red brick. To the most flourishing period of Meroë, lasting till the 1st century A.D., belong the finer specimens of painted and stamped pottery, the glass, decorated tiles, and so forth. The third period Professor Garstang distinguishes as one of decadence, as a period influenced rather by Roman than by Greek ideas in art, while the buildings were crude and lacked distinction. So brief and general a summary of the work accomplished is inadequate, but perhaps sufficient to suggest its historic interest. The Sudan Government, by a provision with which we are heartily in sympathy, bans the removal of objects whose position *in situ* have been definitely located, so that the chosen specimens on exhibition at Burlington House are not completely representative of all that has been found. The examples of

sculpture are especially remarkable. They show undoubtedly Greek and Roman influences, mostly Greek, but they also show individual qualities, a life and energy—a character, shall we say?—which it would be foolish to attribute to anything but the personal feeling of the sculptors who modelled the figures. Professor Garstang says that these specimens are the work of local artists. The figure of the local Venus is what might be called to-day post-impressionist (although we believe no title has been found for a certain phase of ultra-modern sculpture), while the great reclining figure ascribed as a king, the group of two figures (a man and woman drinking out of a cup) the torso of a draped figure, the flute player, as well as some of the reliefs of an earlier period suggest commentary on the art of plastic design beyond our present space. The specimens of pottery also possess many qualities which also perhaps may be largely attributed to local talent; it is of thin and delicate texture with impressed or coloured decoration of many types of pattern. There are also specimens of tiny glass mosaic wrought with a delicacy that suggests the effect of enamel, which were probably used, as Mr. Robert Mond, who assisted at the excavations, suggested to us, for the ornamentation of ivory boxes or toilet accessories and other examples of an art which was often eclectic, but which was none the less individual. Through the courtesy of Madame Garstang we are able to reproduce two photographs of the work in progress at Meroë. The illustration showing the Prostyle Temple also shows the working of the cable system, which facilitates the removal of the debris. The other photograph, which shows the foundations of a palatial building, also illustrates the scheme which Professor Garstang has in view for exposing the site of the whole city.

We much regret that Professor Garstang was taken seriously ill on the opening day of the exhibition at Burlington House. All students of archaeology as well as his personal friends will be glad to hear of his progress towards complete convalescence.

The antiquities exhibited at King's College (Egypt Exploration Fund) deal with an earlier phase of the world's history than those at Burlington House. The main work of the season was carried out at Abydos ("the city of the dead in which only the living dwell for the sake of the tombs") by Professor Edouard Naville, in which progress has been made in clearing a building, known as the Osireion, which is situated immediately behind the great temple of Seti. This building, which was entirely subterranean, consists of a huge passage or hall, about 100 yds. in length; leading from this is another passage which is inscribed on both walls with chapters from the Book of the Dead,

Excavations at Meroë: Working with the Cable System.

with vignettes of scenes showing the deceased King Merenptah passing the various gatekeepers of the under-world and entering the Hall of the Thirty-six Witnesses. This passage gives access to three rooms, one of which is a magnificent chamber with walls of sandstone faced on the inside with granite. The exact purpose of this chamber has not yet been elucidated, although it is recognised as the chief apartment of the Osireion. Some work was also done in the cemeteries of Abydos, and adjacent to the building of the Osireion the remains of what appears to have been a predynastic settlement were discovered. At the beginning of the season, work begun in the previous year was continued on the Ptolemaic site at Atfieh (Aphroditopolis), and the camp was shifted later on to the western desert to the south of Behnesa (Oxyrhynchus). A stretch of fifty miles was thus examined and yielded remains of the Ptolemaic and Roman civilisations. Many specimens from the field of operations as well as a model and some photographs and water-colour drawings of the Abydos temples are shown at King's College. Among the most interesting finds from the predynastic settlement is a large number of flint implements consisting of knives, saws, scrapers of various forms, and borers. The model of the kiln or furnace found on the borders of this settlement possesses some interesting constructive features. Each great jar or kiln (the group was made up of twenty-three such jars) is coated outside with clay and supported by a number of fire bricks of varying lengths. At the bottom of each of these great vases was a pottery dish into which was closely fitted, in some cases, another dish of the same shape. Each dish had a crested bird of primitive design incised on its outer surface. A wall of fire bricks encircled the rows of vases, which were also covered in above the level of the rims with a layer of clay and bricks. The purpose of this kiln is conjectured as being for the manufacture of some kind of beer. Among the objects of the Late Dynastic periods are a fine specimen of glaze scarab-wings, a blue glaze cup, and a Coptic vase with design of birds and fishes. There are also several stelai, some of them greatly damaged, of the Middle Kingdom period, with their intimate biographical and at times poetic touches in the inscriptions and the vignettes. The examples of the cartonnages of the mummies of the Ptolemaic period are well represented, and the rich design of this armour of the dead (for the pieces are fixed together very much like medieval armour) possesses much of symbolic and artistic interest.

At University College we have an exhibition of the antiquities found by Professor Flinders Petrie and his students during their recent excavations at Tarkhan, Heliopolis, and Memphis. The objects discovered include many of considerable value in view of the historic association of the sites, although their intrinsic artistic interest may be comparatively small. In the construction of some of the coffins pieces of house timber were found re-used. These fragments agree with Professor Petrie's theory with regard to the panelled or recessed decoration in buildings, as copied from timber houses, built of overlapping vertical planks. The planks have rows of tie-holes in the edges for lashing them together, so that they could slide one over the other when shrinking or swelling. Some examples were deeply weathered outside and burnt inside, showing that a house had been burnt down and the scraps used as waste for coffin-building. We have thus preserved to us, according to Professor Petrie, the examples of those wooden forms which were so generally copied in the early architectural decoration. The work of this year's excavation has been carried on between forty miles south and six miles north of Cairo. The great cemetery of Tarkhan, which continued in use until the rise of the pyramid builders, yielded much in the way of woodwork, baskets,

and clothing in an excellent state of preservation. On the eastern side of the Nile a Roman fort of peculiar type was unearthed on the site of Miniet osh Shurafa, while at Memphis the great sphinx was cleared as well as the northern gateway of the temple. Many of the smaller finds are exhibited at Gower-street, including a Roman capital with plaited stems and foliage from Shurafa. At Heliopolis the plan of the temple site was traced and half an acre of ground cleared.

UNIVERSITY OF LONDON. UNIVERSITY COLLEGE, SCHOOL OF ARCHITECTURE: EXHIBITION OF STUDENTS' WORK.

THE impression conveyed by this exhibition is that the methods followed are thorough and broad. The student's time is not frittered away, and he is not called upon to design in all or most of the historic styles, yet there is evidently considerable latitude allowed in expression.

The work is academic in the sense that the "Orders" play an important part, and correctness of proportion is evidently insisted upon, but otherwise each student has a free hand. In many cases the first-year work is well above the average in this respect, and the orders, which are apt to appear lifeless and meaningless, acquire interest and vitality when represented by studies of actual examples, in which the particular order has been employed with details to a large scale. These drawings are all shadowed and rendered in colour or monotint; the best are by Messrs. Ian Hamilton, Haro, and Villegas.

The building construction exercises are in many cases worked out in isometric projection. This method not only makes the work more interesting, and allows each student some scope in draughtsmanship, but also brings the different trades together in the same manner as they are blended in actual work. A geometrical drawing of a floor or a roof by itself is often but a dull production, but when these are drawn in conjunction with the walls and the coverings they acquire some attractiveness. In the more advanced stage the workmanlike diagrams illustrating structural steelwork, arched construction, etc., together with the records of actual tests of materials carried out in the engineering laboratories show that this important branch of the subject is also amply dealt with. Mr. Gaunt's design for a "Screen on the Street Boundary of a College Quadrangle" illustrates the thoroughness referred to above. The construction is shown throughout in well coloured and shaded drawings. Mr. Gaunt is also represented by some good measured drawings to a large scale of the cupola of University College, which show that Wilkins in constructional matters was not above borrowing an idea from Sir Christopher Wren. The designs of the second-year students are unequal; some show promise, and are well imagined, others are weak. There is nothing equal to Mr. Musmann's design of last year. This student is represented by several excellent measured drawings and sketches of Italian buildings, and also by some water-colours which are far superior to the usual efforts in this medium by architectural students.

The work of the evening students appears unfinished by comparison with that of the day men; but some of the designs submitted show a grasp of the difficulties of the problems set and also some skill in design. Mr. S. R. Miller's "Bank and Roadside Hostel" are the most complete and, on the whole, the most satisfactory. The same student sends a set of measured drawings of Great Staughton Church and some "clean" water-colour sketches.

The following is a list of the awards made:—*Donaldson Silver Medal*.—Mr. Oliver Gaunt. *The Worshipful Company of Carpenters' Travelling Studentship of 25*l.**—Mr. S. Miller. *Design Class*.—First prize, Mr. W. G. Whincop; second prize, Mr. H. S. Taylor; hon. mention, Mr. G. F. Clarkson.

Measured Drawings and Sketches.—Mr. H. S. Taylor.

Extra Prize.—Mr. G. F. Irwin.

MISSION CHURCH, BRISTOL.
A new mission church has been erected in the Parish of St. Michael, East Bristol, from the designs of Mr. C. A. Rowley, architect; the builders were Messrs. R. Wilkins & Sons, Bristol.

OUR VANISHING MONUMENTS.

THE Joint Committee of both Houses of Parliament, now sitting under the chairmanship of the Earl of Plymouth, is collecting valuable evidence with a view to strengthening the law about the preservation of ancient monuments. The subject bristles with difficulties of all kinds, and in the many-sidedness of the question lies the chief difficulty, as the reason for the disappearance of many of our notable possessions is directly due to the people who ought to be their most zealous guardians. The Town Councils are offenders in this respect. The case of Beon-Tweed, where it was proposed to demolish a part of the Edwardian walls to make room for modern dwelling-houses, is only one instance. Rochester, too, where some old houses have been destroyed to make room for an electric tram is another, and similar instances, some happily prevented by strong efforts on the part of a few enlightened people, but, unfortunately more often successfully carried through to the reader in almost any town in England. The old town halls, once the meeting places of the "guild merchants" or Town Councils, have often suffered. Sometimes because they were inadequate to the newfound importance of the town (but then surely they could have been used as museums), and often solely because they were in a position in the open market or village square rendered them particularly liable to successful attack. Market crosses, too, have been less destroyed for similar reasons, and many praying crosses that once pointed the way to the pilgrim, few even remain in the country, while many have had their heads knocked off and stand as gateposts to fields.

Our larger churches are now happily in the hands, but the "restoration" craze has obliterated many of their glories, and the smaller parish churches scarcely any more untouched by the heavy hand of the "God-restorer." Mr. Thomas Hardy the novelist tells of one case where the local contractor down the old screen, oak and resplendent with gold and colour, and put up, at his charges, a new one of varnished deal. The one was used to boil the workmen's kettles, though "a were not much at that." Bedfordshire, too, may recall a case in which a demolished chantry chapel in his chance he might be responsible for the dilapidated and instances could be multiplied indefinitely. The pious donor, too, is a source of trouble. The plate and documents have been in many cases dissipated through ignorance or cupidity. Fire, too, still claims its toll both of churches and of mansions full of priceless treasures. The craze for modern conveniences has ruined many a fine house and destroyed many in the chain of our artistic development. Of means, especially on the part of the owner, who is often unable to carry out repairs, is a serious consideration. In one case related to the writer, owing to the being in Chancery an interesting old East London mansion was allowed to literally fall to pieces.

Old bridges, again, are often a mark for "progressive"—using the word in a strictly non-political sense—party, who often desire a new bridge rather than in attempt to repair the old, as the recent case of the "Brig of the future of Richmond Bridge is a case in point.

The old almshouses, also, are apparently regarded lightly by their protectors, to judge by the rapidly with which these memorials of the kindly past are destroyed for very questionable benefits, and prehistoric remains are swept away without thought; in one case even several old barrows were destroyed to make a course.

Then, again, the power of the American purse tends greatly to the vanishing of many of our most valuable monuments. How much will never be known, for it is every case that reaches the public eye, and undignified appeals to the art-lover evoke often a feeble response; nor is this only confined to furniture and pictures—whole buildings are often being bought after, and it is not every case that ends as well as that of the Tattersall Castle fireplaces. All this only tends to increase the complexity of the problems before the Committee, and it is to be hoped that similar regulations will be the result of their labours. With regard to the question of purchasing foreigners, it may be fitly asked when we follow the lead of most European countries, notably, Italy—and prohibit the exportation of works of art and historic interest by statute, additional point is given to this side of

by the fact that the famous "Globe" from the Reindeer Inn at Banbury London with its ultimate destination appeals to the charitable among art would not be, nor are they really, necessary, for the rest, state ownership is not desirable. The first step, however, is an official survey of all fabrics, pictures, etc., followed by, let us say, a selection, backed in necessitous cases by aid on easy terms, and, in very special cases, purchase of the object in and arrangement in such event for the public. The success of the measure will entirely on a broad-minded attitude of the administration in order to hardship to individuals, and the true of the future legislation may be best in the words of Dean Church. "In earnest for improvement it concerns us our guard against the temptation of we can have the fruit or the flower and of the root. It concerns us that we wise our birthright and cast away our of gifts and of powers which we may not recover."

HOUSE IN DURBAN.

house, designed by Messrs. E. O. & W. S. Payne, is built of brick, the external facing faced with pressed bricks, except high cast on lounge piers and front bay cony. The lounge was placed cony near the kitchen to serve as an open- room in hot weather, and the front was also provided as a sleeping-place. The roof was made flat to form an open- space from which to view the Indian Durban Bay. The pitched roofs are with French tiles, and the windows have ghts.

GENERAL NEWS.

London University.

much discussion and consideration of available sites the Senate of the University of London have adopted the recommendation of the Committee appointed to report on the subject. The decision is that the Found- ional site shall be acquired.

Universities of the Empire.

ture of great interest in the recent ties Congress was the exhibition in the of the Imperial Institute of University and building. This exhibition was

unique of its kind, no such representative collection of pictures, plans, drawings, and technical data on the subject having ever been got together. Prepared by Mr. C. R. Ashbee, F.R.I.B.A., for the University of London, together with an analytical catalogue and survey, worthy of careful study, it covered the recent work in building and planning, or the greater work immediately in con- templation at forty-two English-speaking Universities. Nor was the wonderful work displayed restricted to English and Colonial Universities alone. Twelve of the more important American Universities contributed representative drawings and plans, and it is significant how in many respects the latter can teach lessons to the English University builders. Mr. Ashbee's survey was based upon a Report made by him for the Hungarian Government which, more far- sighted than we in matters educational, have decided that the building of certain new Universities is one of the needs of their modern industrial and agricultural development, and as a preliminary study to this have caused this survey to be made of work already in progress among the English-speaking peoples. The University of London was indebted to the Hungarian Government for the use of the material thus gathered together.

Designs of Government Buildings.

In the Parliamentary papers recently two questions were put by Mr. Bennett Goldney to the representative of the First Commissioner of Works relative to the design of Government offices. In the first place he asked whether, in view of the dissatisfaction both expressed and suppressed with which the designs and accom- modation of the more recently completed Government offices have been received by the public, he will arrange with the Government that the preparation of all plans for future public buildings shall be thrown open to public competition; whether, in the new buildings already contemplated, he will take steps to prevent any repetition of the mistakes which have so dim- inished the general comfort and convenience of large portions of so many of our more recent public offices; whether he will see that in any future plans the errors of internal planning, which are so palpable in the new offices of the Board of Trade and other buildings, insufficient lighting of many rooms, over- lighting of many corridors, lavish distribution space on the one hand and cramped accom- modation on the other, are not repeated; whether he will take steps to prevent the continuance of the present style of internal furnishing and so- called decoration of the interiors of our public offices; and whether he will, from this time forth, abolish the present system of only inviting designs for public buildings from a privileged panel of selected architects.

Mr. Wedgwood Benn, in reply, says all these matters are receiving, and will receive, the most careful consideration of the First Commissioner. While guarding against such defects in new buildings as the Hon. Member indicates, the First Commissioner must not be understood to admit, as a whole, his sweeping indictment of existing buildings. It is not clear to what new buildings of the Board of Trade the Hon. Member refers.

The second question was whether the First Commissioner will in future give the Members of the House an opportunity of examining all competitive schemes for the erection of new or the alteration of old Government buildings before any such schemes are finally chosen and approved, and whether he will give Members an opportunity within the House itself of seeing any schemes which may be selected for final approval before the final choice is made; whether he will inform the House as to the method of appointment of architects and others to the panel from which the designers of our more recent buildings have been selected; whether all qualified architects are eligible for a place on the panel; whether architects may appoint themselves to the panel; and, if not, will he explain why in the past certain archi- tects of merit have been left off the panel while others of less notoriety have been promoted to a place upon it.

Mr. Benn: As has already been promised, designs for all the most important building schemes will be exhibited to Parliament before final approval, but the First Commissioner is doubtful whether opportunity can be given for their inspection within the House itself, though he hopes to be able to arrange it. It was stated last year that in recent cases architects have been submitted from a panel submitted to the First Commissioner by the Royal In- stitute of British Architects. The First Com- missioner does not feel himself able to investigate the proceedings of the Institute in drawing up the panel.

Victoria and Albert Museum.

Two questions have been put by Mr. Grant in the Parliamentary papers to the President of the Board of Education relating to the above Museum, viz.:—(1) "Whether the collection at the Victoria and Albert Museum of book illustrations, engravings, drawings, etchings, and suchlike examples, as appertain to pictorial and realistic art, can now be separated definitely from designs for decorative and architectural work, and these latter be removed to those rooms in the Museum where students are allowed to study original objects of cognate materials. (2) Whether he will cause the congestion of the halls at the Victoria and Albert Museum, containing reproductions of famous historical monuments, to be relieved by removing some of the casts of the XIIIth, XIVth, and XVth century sculptured pulpits, candleabra, tombs, and the like, into the long southern court of the Museum, which is but now partially filled with corresponding original works of less artistic importance for the purposes of serious study than those so well reproduced in the casts above mentioned."

Mr. Pease replies:—(1) In many cases students do not work in the students' rooms, but in the galleries. Facilities are given to students to study designs in the departmental students' rooms, and so far as is possible arrangements are made for placing the designs for various materials in proximity to the objects of cognate material in the galleries. (2) Some of the difficulties connected with the position of the collection of casts are referred to in sect. 5 of the Report on the Museum for the years 1909-10, and the Honourable Member will find set out in that section some objections to the course he suggests. The question of the disposal of the casts is now under consideration.

Church and Steeple of St. Mary-le-Bow, Chapside.

In a "Note" of August 12, 1899, we referred to the somewhat alarming statements that were then current concerning the stability of the tower and steeple of St. Mary-le-Bow Church. We were enabled to announce, upon the authority of Mr. Charles Innes (of Messrs. Tress & Innes), architect and surveyor to the churchwardens, that the fabric was not in a dangerous condition, though fissures had in the preceding autumn become apparent in the north, south, and west walls, and in the pave- ment, from east to west, of the vestibule on the south side of the tower. Careful plumbing evinced that the top of the belfry stage, about

NEW RESIDENCE ON
DURBAN ROAD DURBAN
E. O. & W. S. PAYNE, ARCHT.

Durban, Natal.

A House in Durban.

Messrs. E. O. & W. S. Payne, A.A.R.I.B.A., Architects.

120 ft. above the pavement, inclined northwards 12 in. out of the perpendicular, thus breaking away from the vestibule, and the latter, in part, from the north wall of the church. About ten years previously Mr. Innes had repaired the stonework of the tower and steeple, and stripped the cement from the body of the church, so as to again expose the original walls of thin red brick. Five years ago it was stated that an examination of some plaster "tell-tales," which had been fixed over the cracks in the walls, showed the "tell-tales" to be intact. We now learn that Mr. E. Setton Underwood, F.R.I.B.A., has been recently consulted in respect of the condition of the tower, and reports that, in spite of slight decay, the stability of the tower is not impaired. Some repairs are about to be carried out, at a cost of about 400l. George Gwilt, the younger, restored, in 1818-20, the upper part of the steeple, which had become considerably tilted by the exfoliation of an iron tie worked into the masonry; he rebuilt the upper parastyle and the obelisk to a height of some 40 ft.; a few years afterwards he made an extensive reparation of the foundations.

Museum of Practical Geology.

The total number of visitors to this Museum in 1911 was 50,983—36,208 upon week-day mornings, 10,510 on Monday and Saturday evenings, and 4,265 on Sundays. In the entrance hall of the Museum a more suitable distribution of the larger exhibits has been made possible by the removal of the Ludlum store cases from the stairs to the basement. A new wall case has been added to the building stone series. A set of building stone samples has been placed on the roof to provide illustrations of weathering. The examination of samples of macadam has been continued. These are now received from the Road Board after they have been submitted to Mr. E. J. Lovegrove. The following donations, amongst others, were received at the Museum during the year: Twenty-five specimens of Finland granite; nineteen specimens of analysed rocks from Australia; two specimens of "Roman stone," presented by the Army and Navy Auxiliary Co-operative Supply, Ltd.; ninety-three specimens of Swedish rocks; twelve slabs of coloured clays, "Dorset marble," given by Lady Baker; two samples of Portland stone "Roach" from the Bath and Portland Stone Firms Company, Ltd.; specimens of Cuban asphalt and kindred productions from the British Cork and Asphalt Company, Ltd.; six dressed blocks of "reconstructed" stone from the British Stone and Marble Company, Ltd.; a cube of Dartmoor granite, from the Governor of Dartmoor Prison; two samples of bricks from the Down Mill Brick Company, Ltd.; an exceptionally fine and extensive series of British rocks and fossils, being part of the collection of the Geological Society of London; forty-seven specimens of rocks from Lundy Island; a series of fossils from the Devonian and Carboniferous of North Devon; illustrations of apparatus for the testing of building stones as employed by Professor Dr. J. Hirschwald at Charlottenburg, Berlin; four specimens of quartz (Cairngorm), the gift of the late Countess of Seafield; series of "coal apples" from Lanarkshire; a building block, from the Pentewan Brick and Development Company, Ltd.; two samples of artificial paving stone, from the St. Keverna Stone Company, Ltd.; six specimens of Irish granites, given by Mr. E. Wettren; two specimens of tourmaline granite from near Ivybridge, Devon, given by Mr. B. H. Worth; two specimens of Austrian building stones, from Messrs. Whitehead & Sons, Ltd.; specimen of Hertfordshire "pudding stone," from Mr. W. Wright; three specimens of Aberdeen granite, from Mr. H. Hutcheon; specimen of Norwegian slate, from Miss Johnston, etc.

Visit of German Town-Planners.

The Garden Cities and Town Planning Association, of 3, Gray's Inn-place, W.C., are arranging for another visit of members of German municipalities to inspect English Garden City and Housing schemes under the guidance of Mr. Culpin, the Secretary. The party, about 100 strong, will arrive in England on August 18, and the next fortnight will be spent in visits to practically every housing scheme of importance in the country. Among other places which will be seen are the Garden Villages of Hull, Earswick, Port Sunlight, Bournville, and Knebworth, the Garden Suburbs

of Wavertree (Liverpool), Harborne (Birmingham), Hampstead, Ealing, Ilford, etc., while special interest will be taken in the Garden City of Letchworth, where more nearly than any other place in this country the question has been solved of the provision of labourers' dwellings at an economic rate. Students and others who would like to join the party at any point or to meet at their social gatherings are invited to communicate with Mr. Culpin at the above address.

Marble Work at the British Museum.

Mr. Tyson Wilson asked the First Commissioner of Works whether the contractors of some marble work in connexion with the British Museum have been granted permission to sub-let part of the contract abroad; and whether other points of view besides those of the employers were taken into consideration, in view of the fact that competent workmen can be obtained in this country?—Mr. Wedgwood Benn replies that the contractors for the marble work in connexion with the British Museum have been granted permission in accordance with the custom in the trade to sub-let a part of the contract abroad. This is in conformity with the Fair Wages Resolution.

St. Bartholomew the Great, West Smithfield.

In the course of operations for the erection of premises on the site of some old houses at the south side of the church for Messrs. Israel & Oppenheimer, their architect, Mr. W. Pamphilon, has found what is believed to be the three-arched entrance from the cloister into the chapter-house, and of early XVth-century workmanship. The cleared site is that of the older chapter-house and the slype. Below the tiled floor, and in the middle of the chapter-house site, was found, too, the empty stone coffin of a Prior.

The National Trust and Open Spaces.

Miss Octavia Hill makes an appeal for an amount of about 500l. to secure the acquisition, on behalf of the National Trust, for 1,550l., of an important and lovely piece of land—Mariner's Hill, near Westerham and Limpsfield, partly copsewood and partly open meadow, and constituting a spur of the elevated ranges of the Kentish and Surrey Hills. It is stated that the legal formalities will shortly be ratified, whereby Colley Hill, Reigate, will be taken over by the Trust. The subscription list, however, is still open, and it is hoped the balance will be raised before the transfer is effected.

Finchampstead Ridges, Berks.

The committee for purchasing from the Bear Wood estate trustees and vesting in the National Trust a part of the Finchampstead Ridges have secured an option of purchase of 60 acres at a price of 3,000l. Towards that sum they have received promises for 2,400l. and a donation of 500l. from Mr. John Walter. There will thus be preserved the fine prospect, across the valley of the Blackwater River and Yateley village, extending to Eversley, Hants, Hindhead, and Highclere Beacon, nearly 30 miles distant.

British Association for the Advancement of Science.

At the annual meeting, September 4-11, under the presidency of Professor E. A. Schifer, F.R.S., Professor of Physiology in Edinburgh University, in Dundee, where the Association held their first meeting in 1867 under the presidency of the Duke of Buccleuch, the Engineering Section will be presided over by Professor A. Barr, of Glasgow. In the Section of Anthropology, of which Professor G. Elliot Smith, F.R.S., of Manchester Victoria University, is President, papers will be read by Professor G. A. Reimer, of Harvard, upon his excavations at the Giza Pyramids; Professor Bosanquet, Mr. T. E. Peet, and others, upon the archaeology and megalithic monuments of the Mediterranean; Mr. A. J. B. Wace and Mr. N. T. Thompson upon excavations conducted in Halos, North Greece, by the British School at Athens; Professor Flinders Petrie, on early dynastical discoveries in Egypt during the past season, and Mr. A. H. Gardiner on Theban tombs; also by Mr. W. Gardner, upon an exploration of the Parcy-Meirich hill-fort near Abergele, and Mr. Marett upon the palaeolithic deposits in the caves of Jersey.

Window, St. Chad's Church, Over.

In St. Chad's Church, Over, near Winsford, Cheshire, a beautiful window has been placed, representing St. Chad in cope and mitre,

preaching to the Mercians. This consists of the second of a series of "Kempe" windows illustrating the life and episcopate of St. Chad, which have been designed for Over Church. St. Chad's connexion with Cheshire is still perpetuated by many ancient church dedications.

BOOKS.

The Taxation of Land Values as it affects Landowners and Others. By JOHN ORR. (London: P. S. King & Son. 1912. 12s. 6d.)

WE cannot give a better idea of the object of this little treatise than by quoting a sentence from the last chapter, which is entitled "Practical Policy":—"With the repeal of existing rates and taxes and with the substitution of one rate and one tax directly on land values, economic rent will rise sufficiently to provide an ample surplus." Economic rent is defined as "that part of wealth which is produced by the expenditure of capital and labour in common services, as distinguished from interest and wages, those parts which have been produced by the expenditure of capital and labour." The author founds his arguments upon the opinions of statesmen and economists—Locke, Wyndham, Quesnay, Turgot, and others—who mostly lived at a time when land occupied a very different position in the industrial economy to that which it does at the present day, and upon experiments in colonies, where again land is the prime element in production. We cannot refrain from quoting one extract from a letter from Turgot, written in 1784, advocating this system:—"I do not enter into the detail of the objection about foreign trade, which I cannot regard as a very important matter in any country, in so far as it contributes to increase the revenue from lands and which, moreover, we cannot without causing it to diminish." Foreign colonial experience hardly appears to confirm this statement. Some portion of the book is addressed to the conversion of Lord Russell, who criticised the scheme in a speech delivered in the House of Commons in 1910. The author is genuinely impressed with the theory, and sees in their practical application not the millennium, at least a cure for depression, business depression, and unemployment.

Silverwork and Jewelry. By HENRY WILSON. (London: John Hogg. Second edition. 6s. 6d. net.)

THIS second edition of Mr. Henry Wilson's book has been considerably enlarged, interesting chapters dealing with interesting methods of processes having been added, and the volume now published forms a very able treatise on ancient and beautiful craft, which shows in the hands of all craftsmen working in precious and other metals.

One of the most notable features of the book is the fine letterpress and illustration, which strikes one immediately on opening the book. The illustrations, which are chiefly reproductions of very well-drawn sketches showing work in various stages, make the letterpress tolerably clear to the reader—although, of course, it must be obvious from the very nature of the work, which the author tries to explain in a good many of the processes described, can be thoroughly learned by means of practical instruction from a practical craftsman. If some of the chapters dealing with practical work will convey very little to the beginner, they abound in fine ideas and suggestions, which the craftsman will appreciate after the elementary principles of the craft have been mastered. The number of candlesticks, cups, boxes, spoons, and a variety of jewellery, etc., are fully described from the author's point of view, and although one may disagree with some of the methods of manufacture described and advocated, most of them are quite practical and workmanlike. Almost all the new chapters which have been added in this second edition, the one dealing with Japanese methods of working should be of great value to craftsmen in this country.

It is, however, the concluding chapter of Wilson's book, "On Design," which is the chapter in the book, and it seems regrettable that it was not made the first chapter, which would have been an admirable introduction and would have explained the author's point

in the following chapters. "Design and craftsmanship are indivisible"—that is the theme of this chapter, that is the keynote of the book—and the keynote of all good craftsmanship.

CORRESPONDENCE.

The Regent's Quadrant Competition.

—In connexion with the Regent's Quadrant Rebuilding Competition, on behalf of the company, please accept my thanks and the expression of my appreciation of the manner in which your important journal has attempted to follow and I hope successfully, what has hitherto been a difficult problem.

My letter published in your issue of 10 I offered, in the name of my company, a highly suitable design, when obtained, but will probably be much delayed before this design can be arrived at Messrs. Swan & Edgell, Ltd., would like to announce through your paper, that, if the offer is acceptable, they are prepared to award to each of the first, second, third, and fourth prize-winners in the recent competition a similar premium to that given by

A Court for Building Cases.

—For many years I have endeavoured to bring forward the advantage of instituting a court for building cases. Although the idea has been favourably received by some high authorities and has met with general favour among my professional brethren, it has up to now been, for various reasons, practically impossible. At the present time, there are two vacant judgeships in the Bench Division, and the early appointment of a new judge is necessary. I venture to think the importance of elevating to the Bench of those barristers who have had special technical training, or whose practice has brought them into such contact with building cases as to make them familiar with the technicalities which sometimes appear formidable obstacles in the way of a case. A Court presided over by such a judge as I suggest would necessarily tend to do away with many cases which in the ordinary course are considered difficult and relegated to the Special Referees; and the familiarity of the judge with the subject would greatly tend to expedite the hearing of the case and to lessen costs.

Moreover, the other reasons that go to the credit of the institution of a judge to preside again, and the promotion is more to be made on political grounds than on grounds of suitability for any speciality. In that event I humbly venture to suggest that a court which seems to me to be in the air should be put into practical use in this connection. I mean the creation of paid professional jurors. A certain number of men having the necessary qualifications and technical knowledge might be called in to undertake to act as Jurymen in such cases as I have referred to, and their remuneration might be fixed at the rate of, say, three shillings per day, which would be sufficiently high to attract men of standing and experience. Such a panel of special Jurymen ought to be composed of architects, surveyors, engineers, foremen of works, and even tradesmen and mechanics, and might be of sufficiently large numbers to ensure the obtaining of a jury at any time.

This would have the effect of saving time of busy men who sometimes are called to waste time, to their sorrow, in going about in Courts and in hearing cases on which they cannot but feel that their time, and that is valuable to themselves, is thrown away. These special Jurymen would not be called at any time to serve; but, having passed their willingness to do so, might be called from the panel by agreement between solicitors on both sides, and save the time wasted in challenges in open Court. The cost of such a special jury would undoubtedly be small, but it would probably only be called upon in specially important cases where large sums are at stake; and the advantages of having a skilled in the technicalities of the case would be very marked, and would certainly tend

to avoid miscarriage of justice. I am by no means sure, but I imagine that it might be possible to reduce the number of special Jurymen if desired, and hear the case before a jury of five or six.

I venture to commend the idea, which might be applicable for other cases than those connected with the building trade; in fact, it is in reference to general cases that I have heard the idea of professional Jurymen mooted.

HENRY NORTHGROVE.

Building Act Problems.

SIR.—I have read with interest your criticism of the case recently heard at the Greenwich Police Court, in which the District Surveyor took out summonses against a builder for failing to give notice in respect of a drainage excavation.

I should be glad if any of your readers could inform me whether I am compelled to give notice in cases of excavation within 3 ft. of a building, but in which no parts of the foundations or structure are in any way interfered with.

Also, I should be glad to know whether I am liable to pay the fee of 5s. in respect of such excavation whether notice be given or not.

BUILDER PUZZLED.

The Insurance Act and an Approved Society for Architects' Assistants.

SIR.—My attention has been called to a letter from Mr. Dixon in your last issue in reference to the formation of an approved society for architects' assistants under the Insurance Act.

A small committee of the Architectural Association have for some time had this matter under consideration, and hope to make some definite announcement after the next meeting of the Association's Council.

H. AUSTEN HALL, Hon. Sec.
Architectural Association.

SIR, With reference to Mr. Dixon's letter, many architects and their assistants are probably unaware of the existence of a professional society which caters largely for architects, civil engineers, and their assistants, and which has branches in most large towns. I refer to the Scottish Clerks' Association of Glasgow. The benefits are over and above those of similar institutions, and the Association is not a trade union. Indeed, applicants of the highest character only can be admitted.

STUDENT (Society of Architects).

MAGAZINES AND REVIEWS.

THE *Burlington Magazine* continues its article upon "Early Furniture," and illustrates some beautiful XVth-century coffers.

Three types are shown, the flowing design, based on rose or vine, geometrical "chip carving," and arcaded designs derived from window tracery. The last of these, as might be expected, shows to great disadvantage. In the second group Cairene influence is evident. The same appears sometimes in XVth-century chair screens.

We have often wondered how it is that, notwithstanding the fine examples of wood-carving obtainable, Jacobean designs are preferably disseminated throughout our art schools.

"Garden Suburbs, Villages, and Homes" commences with an attack on the word "suburb," and suggests village in place of it. We do not share this dislike of the word. Hemmed in by building now or soon, "village" would not be descriptive. It is the mission of the garden suburb to redeem what is appropriate and even classical from unpleasant associations.

"Lincoln's Inn and its Treasures" are described and illustrated in *The Connoisseur*. Portraits of old benchers—Francis Hargrave and Lord Erskine, wonderful things painted by Sir Joshua, and reproductions of pewter cups and flacons of fine design.

The records of the Honourable Society go back for over six centuries. It had its origin in a group of lawyers who, between 1236 and 1310, were brought by Henry de Lacy, Earl of Lincoln, to settle near his manor-house at Holborn, then spelt, indifferently, "Holeburn" or "Oldborne." The first settlement was subsequently known as Thavies Inn, and subsequently overflowed on to property belonging to Lord Furnival, which became Furnival's Inn.

By 1422 they had again outgrown their accommodation, and established themselves where Lincoln's Inn now stands.

The gatehouse fronting Chancery-lane belongs to the year 1518, and is built of brick made from the clay quarried in the old conveyance yard, the site of the present New Square. The Old Hall dates from 1480, "the most ancient structure in the inn, but sadly modernised."

"Like the old Hall, the chapel has passed under the hand of the restorer, not once but several times," one of the several being Lord Grimthorpe.

In the *Nineteenth Century*, Mr. Robert Fowler, R.I., speaks out. "Is art a failure," he asks—the art of "Rembrandt and his fellow aristocrats of art?" He is urged to ask this, disturbed by the clatter of symbolist, cubist, and post-impressionist, and all such modern theorists who tilt against the other theory that art is an imitation of Nature—"beautiful Nature, and all that humbug." When Whistler announced in his "Ten o'Clock" that "To say to the painter that Nature may be taken as she is, is to say to the player that he may sit on the piano," he said what was not unreasonable at that particular period of Royal Academy standards.

But what, after all, does "imitation" in nature actually amount to? Mr. Fowler comes to grips with his adversaries upon this. He explains that the painter can at best—or at worst—only approach his object by means of his visual organs, which record what he sees upon his brain, already saturated with undue impressions that he cannot escape from if he will.

Psychologists are agreed that it is the brain which is the master, and one interpretation "is not what lies in the phenomenon, but what we add to it from the means at our command, not what the senses communicate to the brain, but what the brain makes the senses believe." To put it plainly, such a thing as imitation of Nature does not exist. It is a matter of personality.

As regards the "Symbolist," "it should not be forgotten that every object in nature is a symbol." "Post-impressionist" and "Symbolist" have no special claims. They will be judged according to the common law of art, that is, upon the verdicts already given upon the work of great painters.

Those who are interested in the doubtful etymology of "Cold Harbour" will find some interesting information in the *Home Counties Magazine*, relative to the important one originally situated in Dowgate.

In *La Revue Générale* we read with pleasure an appreciation of the Pre-Raphaelite painters, by M. Arnold Goffin. France has never been backward in generous praise of these and the earlier English masters, praise which a growing knowledge of those periods has added to rather than diminished.

INTERCOMMUNICATION COLUMN.

English and Foreign Rolled Steel Joists.

SIR.—Will you be good enough to let me know by inserting in your Intercommunication column how to distinguish between English and Belgian or other foreign rolled steel joists? I am given to understand that all British steel is marked every 6 ft. apart. Is this so, and does it apply to all sizes, etc.?
CORRESPONDENT.

Reply.

[**] In answer to your correspondent, it is the custom of English and Scottish makers to roll their name or that of their works upon every joist. The inscription is repeated at about 6 ft. intervals, so that if a 10-ft. length be found without the mark, it is practically certain to be foreign. "Broad flanged beams are (with the exception of one or two sections) rolled only abroad, and it is, therefore, useless to specify that these must be of English make. It may be added that some foreign makers are now rolling to the British Standard Specification in every respect, so that in some cases the mark rolled on the steel is the only means available of identifying the place of origin of an individual joist. If foreign joists are used, it is generally best to arrange for tests to be made by independent testers; this is, of course, often also done in dealing with English material, although in many cases the Mills test certificates are accepted.—ENGINEER.]

ILLUSTRATIONS.

Winchester Cathedral.

R. THOMAS R. WAY, whose lithograph of the interior of Winchester Cathedral, specially executed for the *Builder*, is published this week, has not only made a reputation for himself by his artistic work, but has achieved distinction by his association with other artists, notably Whistler, whose use of lithography called attention anew to the medium as a means of artistic expression. Both Mr. T. R. Way and his father, Mr. Thomas Way, were instrumental in promoting the revival in the art. Mr. Thomas R. Way was one of the witnesses for the plaintiff, with Whistler, Mr. (Sir) Sidney Colvin, Mr. Alfred Gilbert, Mr. Edward F. Strange, and the late Mr. Goulding, in the famous action of 1897, brought by Mr. Pennell against Mr. Frank Harris, publisher of the *Saturday Review*, and Mr. Walter Sickert, the writer of an article in which a distinction was made between a drawing done on stone and then printed, and one done on transfer paper, transferred to the stone, and then printed. The foundation of the Seneffler Club in 1910 and the experiments of Sir Hubert von Herkomer, R.A., published in the same year, caused the intricacies of the subject to be brought again before the public. At the present time many artists are using the medium.

Mr. Thomas R. Way, as a pioneer of the modern revival, is one of the best-known artist-lithographers, and he has written and illustrated many books in an interesting way. His lithograph of the interior of the nave of Winchester Cathedral is a notable example of his sympathetic treatment of an architectural subject, and we feel sure that it will be acceptable to all our readers.

Port of London Authority.

We illustrate in this week's issue the design of Mr. T. Edwin Cooper, F.R.I.B.A., which has been adopted by the Port of London Authority on the advice of the assessor, Sir Aston Webb, C.B., R.A. We deal elsewhere (p. 65) with the general features of the competition, and in future issues we hope to illustrate the designs of the other five architects who were selected to prepare drawings in the final competition.

MEETING.

THURSDAY, JULY 23, TO WEDNESDAY, JULY 31.
Royal Archaeological Institute.—Summer meeting, Northampton.

COMPETITION NEWS.

A list of current competitions is printed on page 91.

New Offices for the Port of London Authority.

The Port of London Authority having considered the final plans for their new Head Offices about to be erected in Trinity-square, E.C., sent in competition, have selected, on the advice of their assessor, Sir Aston Webb, C.B., R.A., the design submitted by Mr. T. Edwin Cooper, F.R.I.B.A., of 12, Gray's Inn-square, W.C.

The six designs submitted in the final competition will be publicly exhibited at the River Offices of the Authority, Carmelite-street, Victoria-embankment, E.C., until and including July 30 between the hours of 10 a.m. and 4 p.m. (1 p.m. on Saturdays), with the exception of Wednesday, July 17, when the designs will be on view from 2 to 4 p.m.

Mr. T. Edwin Cooper's successful design for the new offices of the Port of London Authority is illustrated in this issue, and reference is made to the competition in the article beginning on p. 65.

Hamstel Council School, Southend.

In this competition, open only to architects practising in the borough, the first premium (£25) has been awarded to Mr. Laurence T. Weaver, 132, High-street, Southend-on-Sea; the second premium (£15) to Mr. Frank R. Smees, "Thornton," Grand Parade, Leigh-on-Sea; and the third premium to Mr. Percy Brockbank, County-chambers, Weston-road, Southend-on-Sea.

The Architectural Association Essay Prize.

The Architectural Association Silver Medal with ten guineas has been awarded to Mr. W. G. Newton, M.A. Part of the essay is printed in the July issue of the *Journal*.

Elementary School, Warrington.

Messrs. Wright & Hamlyn, of Sankey-street-chambers, Warrington, have been appointed the architects of the new Oakwood-avenue Council School, Warrington, as a result of the architectural competition held.

Scottish National Memorial to King Edward VII.

The selected design by Mr. G. Washington Browne, R.S.A., for the King Edward Memorial at Holyrood, while conceived in a modern spirit, is worked out in strict accordance with the architecture of the major portion of the palace, designed by Sir William Bruce for Charles II. The memorial takes the form of two hemicycles completing the architectural enclosure of the forecourt at its northern and southern ends, which are at present open.

Their centre lines are axial with the fountain at present in the middle of the forecourt, which involves a slight change in the line of the approaching roadways. The northern hemicycle will form, as at present, the principal entrance to the palace forecourt from the City via Abbeyhill, while the southern hemicycle will form a background for the sculptured group of the late King and accessory figures, which would thus occupy a position of the greatest dignity and importance. The group, which is intended to be executed in bronze, represents King Edward seated upon a throne, crowned and attired in the robes of the Order of the Thistle, receiving from female figures emblematic of Peace and Concord the wreath and laurel in recognition of his life work of promoting amity among the nations. The group is set under an arch within an architectural framework of pedestal, columns, and entablature of the Doric Order, the dimensions, form, and detail of which would repeat those of the stately central doorway to the palace. The height of this part of the memorial is 40 ft. above ground level, and the diameter of the hemicycles is 123 ft., so that the scale of the memorial is such as cannot fail to add dignity to the forecourt and to be a not unworthy adjunct of the historic palace.

The position assigned to the memorial will not interfere with any developments which may become necessary in connexion with the use of Holyrood House as a Royal residence, as such development would naturally proceed in the reconstruction of the buildings on the west side of the forecourt.

As a subsidiary part of the design there will be a minor gateway to the forecourt at the foot of the Canongate to mark the line of division between the palace precincts and the city, but of such a character as not to obscure the view of the James IV. tower of the palace as seen when approached by the Canongate. It is suggested that the present high railing and shrubbery between the forecourt and the palace garden should be replaced by a stone balustrade, so that the palace and abbey may be seen in their proper setting, and also that the garden itself may be developed.

The cost of the memorial proper, including the bronze group, is estimated at 15,000*l*. The sculptor associated with the architect is Mr. Albert H. Hodge, of Bedford-gardens, Kensington.

NEW BUILDING, EDINBURGH.

The directors of Deansbank Institution for Girls are to have a new building erected in Canaan-lane at a cost of about 5,000*l*. The architect for the work is Mr. David McArthur, Lic.R.I.B.A., and the building will consist of two floors with outbuildings.

A NEW EXHIBITION BUILDING.

A gigantic structure will be built shortly at Earl's Court by the Exhibition authorities in conjunction with the District Railway. Mr. Leonard Martin, F.R.I.B.A., is the architect, and he hopes that the work will be completed by the end of next year. Briefly, the idea is to provide a hall of sufficient capacity to house the Goliath exhibitions which seem to be the order of the day. The Earl's Court neighbourhood is so easily accessible that the venture should be useful and popular. The floor will be free from columns, and will be 500 ft. long. The total floor area, including the galleries, will be 331,800 sq. ft.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in County Hall, Spring-gardens, S.W., Chaylesmore, Chairman, presiding.

Loans.—The Finance Committee recommended, and it was agreed to make, loans Borough Councils as follows:—Hackney, 6.5*l* for electricity undertaking, and 2,065*l* paving and other works. Hammersmith, 3.7*l* for electricity undertaking.

School, Poplar.—Alterations are to be carried out at the George Green's School, Poplar, at estimated cost of 436*l*. 5*s*.

Theatres.—The Theatres and Music-Hall Committee reported that drawings had been approved as follows:—311, Lavender-hill, abolition of an exit and widening of another; People's Palace, Mile-end-road—alteration to the Queen's Hall; 55, St. Stephen's-row, Bow—provision of fibrous plaster decoration 268, Tottenham Court-road—alteration balcony entrance and exit doors.

Cinematograph Halls.—Drawings have been submitted for erection of new cinematograph halls as follows:—By Mr. H. C. Constantine for a hall at 2, Holloway-road and 4, High-bury-crescent; by Messrs. Norfolk & Priest, for a hall at 140, Maida-vale; and by Mr. W. G. Sprague, for a new theatre to seat 500 persons in West-street, Shaftesbury-avenue.

New County Hall.—The Chairman of Establishment Committee was asked by Mr. Smith whether any steps were being taken to secure the erection of the new County Hall within the next ten years.

The Chairman, in replying, said that tenders would be invited in January for the superstructure with a view to commencing the construction in April, and it was expected that the whole building would be completed by the summer, 1916.

FIFTY YEARS AGO.

From the *Builder* of July 19, 1862.

What Should be the Spirit of Modern Work.

THERE seems at this moment to be no guiding principle amongst us, and that is to be "doing the grand"; to appear richer, greater, or more influential than we are. It is about the most sneaking, vulgar trait that ever existed; it is such mean, contemptible lying. How is it possible that men who love the pleasures of modern society can ever be to noble, honest, simple characters? The love of showing off is universal; the fear of offending society is the law of life. As to man being guided by his own firm conviction of what is natural and right, there are of the few who have sufficient within themselves to do. But the majority cannot do without the world; they are not men, but nondescripts; certainly not likely to be artists ever in a right sense. Now, the great fault of modern art is its vile conceit; panders to the weakness of the age rather than teach the world a sound moral lesson. The insipid modern Italian construction polychrome, and the copyism of French detail, are our latest vanities; full of pretension, elegance, and finickiness. It is sicken architecture to our modern suburban villa—horrid sham from beginning to end. Our everyday life being in itself so miserable, vain and conceited it would be well for architects to be as severe and rigid as possible, eschewing all prettiness and elegance as things appertaining to the devil.

* * We have lately expressed ourselves concerning vulgarity in architectural design pointing out how, to a great extent, it traceable to a faulty sense of proportion, an overestimate or to an underestimate its component parts. It is interesting to note how this same fault—from which we as a nation, do not seem able to escape was pounded by the heavy artillery of an age which boasted Carlyle as Master-gunner.—En.

MONTHLY HISTORICAL REVIEW.

Fig. 1. The Old Cloister, Batalha.

THE ARCHITECTURE OF PORTUGAL.—V.

(Continued from page 730.)

MANOEL'S additions to Batalha are different, not merely from the earlier work there, but from most temples of the Manoelino style.

In the older cloister he filled the arches with tracery of two alternating kinds composed of branch work, one kind of regular network, the other screen of flowing pattern, strikingly certain Indian examples (Fig. 1). He took up again the interrupted work of the Capellas Imperfeitas. The hall of the apse and the apse of the church was replaced by the arch leading from this hall the octagon was replaced by another of elaboration (Fig. 3)—an example of scale (it is over 45 ft. high) of faced and interpenetrating cusped arches, which the edge of each of the planes of cusping is fringed with cusped ornament, each point foliated and, and most of the mouldings enclosing the octagon was also underlying the blocking of the small chapels; and great clustered piers carried up, treated as bundles of ornamenting with hollows filled with heraldic motives. The scheme at that, and the giant but trunks still rise like towers above the piers (Fig. 2). All this work, which, in parts, is interspersed here and there a Renaissance detail, was carried out by Fernandes, who died in 1515. He, also named Matheus, who died between that date and 1533 João de Almeida, whom we shall see at work in Belem and Coimbra, came upon the scene and him we owe a pretty piece of

filling-in taking the place of a window between two piers over the enriched arch above described, consisting of a loggia of two round arched lights, flanked by baluster shafts carrying an entablature with a dainty frieze. Other examples of Manoelino work are to be found at Batalha in the portal of the parish church and in the windows of private houses.

A curious doorway in the church at Alcobaça illustrates the extreme naturalistic tendency of this style, the framing members

consisting entirely of branches and contorted foliage of a German type; they form an ogee head under which the door opening has a pointed arch, each side of which consists of one concave and three convex curves (Fig. 4). Curiously enough, Renaissance arabesques make their appearance on the jambs of a feature whose general feeling is essentially mediæval.

The Templars, who, in Portugal, instead of being destroyed, as elsewhere, were transformed into the Order of Christ under special

Fig. 2. Batalha from South-East, showing "Capellas Imperfeitas."

Fig. 3. Dom Manoel's Arch in the "Capellas Imperfeitas," Batalha.

Royal patronage, and were entrusted with a large share in the conquest and Christianisation of the overseas dominions. They had their seat at Thomar, a city which has amongst its many interesting buildings examples of various phases of the Manoelino style. The polygonal church was enlarged under Dom Manoel by the addition of a western, not as in the English Templar churches of an eastern, arm. The old building thus retains the sanctuary, while one of the three bays of the new ore forms a sort of nave, and the remaining two a

Fig. 4. Doorway, Choir at Alcobaça.

Chapter House on the ground floor and a singing choir on the upper in a fashion usual in the peninsula and exemplified in Sta Cruz at Coimbra. The additions were carried out by João de Castilho, said to have been a Biscayan, probably between about 1505 and 1517, when he removed to carry out works at Belem. The style of his work at Thomar, which does not include the more florid west end, presents the usual characteristics of late Gothic, such as it is seen at Sta Cruz at Coimbra—large untracied windows, pointed in this case, cusped arches, pinnacles decorated with crockets and gables of single or double concave curve, and a profusion of pierced balustrades and crestings. The principal external feature is the beautiful south portal. A richly-cusped arch carries the parapet above and casts a deep shadow on the recessed portion below, in which stands the round arched doorway, the tall spandrel above it being filled with finely-designed canopy work. The splayed jambs and soffit of the doorway are filled with Renaissance arabesques, probably carved later, that is, after 1517, the year in which Renaissance sculptors are first heard of in Portugal. A doorway of somewhat similar composition, probably also by João de Castilho, exists on the transept front of the Conçeição Velha at Lisbon. There the doorway is double, under an enclosing arch, and in the spandrel appears the feature of reversed semicircular panels over the round, arched openings, which also occurs in the tombs at Sta Cruz at Coimbra.

The west end of the new Coro at Thomar presents some features which for their extravagance and originality are scarcely to be paralleled elsewhere (Fig. 5). They are entirely different from João de Castilho's work, and are attributed to one Aynes do Quindal, who perhaps carried on the work after João's departure to Belem. The composition of the extraordinary features which he introduced is all but indescribable in

words. The window illustrated in invariably strikes the beholder at first disgust, but on closer study there is distinguished amid all its riot of brass coral and twisted leaf garlands, its and chains, its knotted ropes and foliage, not only an extraordinary execution, but a distinct decorative. These strange features are usually confined within a rectangular boundary tell in the strong Southern light and great surrounding spaces of bare wall same way as the bold heraldic pattern frequent on the gaunt mansions and churches of Spain.

The rerodos in the old cathedral of Coimbra, illustrated in Fig. 6, and unfortunately distorted by the photograph referred to in the previous article (p. 78). It is believed to be the work of Portuguese workmen executed in the first years of the XVIth century. It is both elegant and refined in workmanship, and with gilding relieved against a dark background.

THE MEDIÆVAL "INBOWER"

MEDIÆVAL woodworkers in England have been divided into the four following classes—carpenters, joiners, inbowers, and prentices. Like the joiner, the inbower very frequently mentioned in the accounts of mediæval builders, most of the work is being executed by carpenters, a certain amount by joiners, and comparatively little by inbowers. The mediæval inbower was paid at a rate of from 6d. to 9d. a day, a slightly higher rate than that allowed the carpenter or joiner.

We find the work of the inbower first alluded to in a builder's account-book of the time of Henry VIII. This book is now in the Public Record Office (Exch. Acc. 204-3). If we will take a certain number of entries describing the work done by the inbower we will find the wages paid them. "Inbowers work framing and playnyng and settinge xi pertycions . . . and more workinge, framynge of a xi inbowede dore same pertycions . . . with furnyng workinge in inbowinge and framynge and vp of iiii clere stores for the saide south of the newe vpper lodgings . . . lye workinge in makinge and in battynge and hanginge of viii dore." In another part of the book we read carpenters' labourers carrying "tymbre the sawe stages to the barne to the inbower the pertycions and dore postes for the

Chimneypiece at No. 53, St. Ann's-street, Salisbury.

in a XVIth-century inventory of a wood-
 worker's tools in one of the Wills published by
 the Surtees Society. The date of this will is

1570, and amongst other ordinary tools it is
 interesting to come across mention of "ii
 embowynge playnes."

A XVTH-CENTURY CHIMNEYPIECE.

SALISBURY, a town to which, except in a few
 isolated examples, such as the beautiful houses
 in the Close, the attention of the student of
 domestic architecture has not been sufficiently
 directed, is rich in remains of the architectural
 past. During alterations of old houses in-
 teresting details have often been brought to
 light; for instance, the chimney-piece which
 was found quite recently in a house at 53, St.
 Ann's-street. This street is one of the oldest
 in the city, and is full of suggestive and in-
 teresting remains, such as the timber-constructed
 Joiners' Hall and many old brick houses.

The house in question has not been well
 preserved, and was once part of a larger house.
 The chimney stands in a first-floor room,
 which ran the whole width of the front,
 but has been divided at some unknown date.
 It was discovered during the removal of a cast-
 iron register with a wood chimney-piece (the
 fixing of which fortunately has not damaged the
 stonework behind), over which the centre quatre-
 foil panel was left exposed. On clearing away
 the surrounding plaster a magnificent XVth-
 century chimney-piece was found in almost
 perfect preservation.

Built of Chilmark stone, with, as far as can
 be seen at present, no joints above the springing
 of the arch, it displays considerable skill on the
 part of the mason, and the iron bar which can
 be seen on the underside of the opening seems
 to have been inserted later, as a precaution, to
 afford additional support to the upper portion.
 The two splayed panels on the jambs are very
 interesting, and the fusion of the mouldings
 round them show the comparatively late period
 of the work.

Above the depressed arch are five panels,
 the two outside ones upright with cusped heads,
 the others quatrefoil with blank escutcheons,
 the centre one supported by an oak stem and
 leaves.

The whole is crowned with a moulded cornice
 the hollow member of which is filled in three
 places; in the centre by a fine rose enrichment
 and at the ends by ornaments, which seem to
 be composed of bay leaves, placed over the
 centre of the cusped panels below.

It may be noticed that the whole proportion
 is nearly a square of 6 ft. 10 in. each way.

The delicacy of the contours is concealed by
 much whitewash, and the owner has wisely
 allowed nothing to be done in a hurry. Mr. S.
 Hibberd, the owner and occupier, has consented
 to this illustration and description being pub-
 lished for the benefit of those interested, and
 he will be pleased to show this fine chimney-
 piece.

Fig. 6. Central Eastern Apse of the Old Cathedral, Coimbra.

Building the Tower of Babel. From a XVth-Century Illuminated MS.

THE TOWER OF BABEL AS DEPICTED IN MEDIEVAL MSS.

In the library of the British Museum several MSS. deal with the story of the Tower of Babel, and many illustrations of the Tower figure in their pages.

In the following few lines we may note some of the peculiarities of these pictures, and the reproduction of the best one of them will enable the reader to form some idea of the remainder.

The one picture selected for illustration is on leaf 17b of MS. 18850. A copy has been kindly supplied for our use by the courtesy of the Keeper of the MSS.

Before attempting a description of the plate it may not be wholly uninteresting to give some few particulars of the book in which the picture is painted. The book was made for the Duke of Bedford, son of Henry IV., and the Duchess, and is known as the "Bedford Missal," a name given to it many years before scholarship had discovered that not all medieval service books were missals. It is a prayer-book. The book was presented by the Duchess to Henry VI. on Christmas Eve, 1430.

This book is generally considered to be one of the most beautiful manuscripts surviving and one well worthy of its royal origin and the period, perhaps the very best for the production of magnificent volumes.

The execution of the little picture here reproduced is very fine, and the various colours used are to-day of extraordinary freshness and vividness, the neutral tint representing the colour of the stonework being particularly realistic. The picture occupies a full page of the volume in which it has been painted.

The scene of the building of the Tower, which

constitutes the main theme throws some interesting light on prevailing art in the Middle Ages. The winch for hoisting large blocks of stone is being worked by two men; the winch itself being apparently weighted by stone to ensure stability. Squared stones are seen lying about, and tools of various description are portrayed, both in use and on the ground.

The unusual system of employing a bucket to convey mortar to the upper stages is to be noticed. In one case the bucket is being filled by the heap of mortar, the heap being protected by a temporary shed. In the other example the bucket is being hoisted aloft by means of a winch worked in the upper stages.

Close to the mortar heap is the water cistern, which is represented as of wood, circular and hooped. This is of interest and value as showing the receptacle which, at any rate at times in those days, took the place of the present-day metal cistern. In the upper stages of the Tower the scene is quite different; confusion is everywhere apparent. At the top of all two angels are seen, each with a hammer, apparently knocking down the stones from the uppermost courses. Men are represented fighting with each other with sticks and struggling furiously together. One man is falling headlong to the ground.

The whole scene depicted both on the ground and on the Tower itself is full of interest.

Little need be said of other manuscripts containing representations of the building of the Tower, all being of inferior interest and beauty to the Bedford volume. Two pictures, however, from other manuscripts may be noted. In one MS., 15 D iii., p. 15b, we see an inclined gangway winding round the completed base of the Tower. Along this gangway the workmen convey the materials for building.

The other MS., Burn 3, which is of an early date, having been in the library of Augustine's Monastery at Canterbury A.D. 1245, contains on p. 10b a picture of the Tower. Here, too, we find an inclined gangway. In this picture, however, we see an unusual portrayal of the hod being carried up the gangway by two men, one bearing the end of the hod. It is possible that the hod was commonly so carried in the XIIIth century.

In the mediæval Wycliffe Bible (Forshall & Madden's edition) we read of the Tower of Babel, in Genesis, chapter xi.: "Come and make we tiel stonys, and bake we th with fier; and thei hadden tiel for stonys, and pitche for mortar; and seiden, come ye and make we to vs a citee and tour, whoo hiynes stretchis til to heuene." It must always be borne in mind that the mediæval representations of any occurrence are invariably delineated with the dresses and accompaniments, etc., of the period in which the drawing was executed, and no attempt was made to depict the architecture and costume prevalent in any particular country at the period when the event took place.

We are indebted to Messrs. Birch & Jenner, "Dictionary of Illuminations" for aid in the selection of the MSS.

AN OLD EPSOM INN.

At the top of the High-street in Epsom stands the beautiful XVth-century house, formerly the New Inn, but now called Waterloo House. It is known to many visitors, and it must surely be the wish of visitors and townspeople alike that it should be restored to its ancient glory. An opportunity seems likely to be offered shortly for restoration to be effected, and though we are not aware that any steps have been taken to achieve this end, such hope has been expressed by individual townspeople. The fine old house, by reason of its architectural merits, deserves good treatment, and it also does on account of its age and association.

Built about 1690, when Epsom was at the height of its popularity as a fashionable resort on account of its medicinal springs, the New Inn, as the place was then called, is marked by a dignity and simplicity and a fineness of proportion which is very charming. The house is built of red brick, with red-tiled roof. The central block, projecting slightly beyond the wings, surmounted by a pediment, while the quoins both of the central block and of the wings, are of stone. Round the building runs a characteristic dentilled cornice, a feature which adds so much to the picturesque appearance of many of the houses built about this time. In accordance with the then prevailing custom, the windows are set almost flush with the face of the wall, and are surrounded by bricks of a brighter hue than those used for the main walling. Right through the centre of the building there was originally a long narrow courtyard, so that coaches could be driven in at one side and out at the other. This archway has since been built up, and the appearance of the front of the storefront inn has been marred by the construction of two shop-fronts, which naturally detract from the dignity of the old house.

Perhaps, however, the chief feature of the New Inn was its ballroom, or assembly-room, considered at the time of its erection, says Mr. Gordon Home, to be one of the largest of its kind in England. Like the rest of the interior of the house this room has suffered a good deal, and has been divided into two. But when it had its panelled walls and was lighted by candles and filled with gay flocks of dancers it must have appeared very fine. Thousands of society people flocked to Epsom in the closing years of the XVIIIth century and the early years of the following century, for Epsom was at that time one of the most fashionable resorts of the country, Bath and Tunbridge Wells not having then attained the glory they achieved later. Charles II. frequently went to Epsom, and Pepps tells us that in 1667, when he (the diarist) visited the town, he found Nell Gwyn staying there. Local legend says that she used to attend the assemblies in the New Inn. One likes to think the old room may have listened to the laughter of Nell Gwyn, and if the date of its erection be only a few years earlier than that named, such may have been the case. The fascinating actress died in 1687.

It seems a pity that the house, with its dignified old-world air, should be divided up and

ly, and its stately front marred by shops. Lady remarked, the opportunity to restore something of its former state seems to be now, for one of the shops is closed and so of the other, it is understood, expires. Could not the place be acquired and then used as a library or museum some similar purpose?

HISTORICAL NOTES.

PROPOSALS are made to clear away some of the later buildings which encumber the Church of Saint-Gervais, now partly hidden behind the Hôtel de la Caserne Napoléon. This table church was finished about 1420; in de Brosse added the classic portico in 16; the beautiful Lady Chapel was added in 1845. The Chapelle Scarron has 17th-century decoration; and the walls of the church yet retain some of the glass by Pissier and Cousin; the altar, generally ascribed to Dürer, is by his Aldergraver, who died in 1562. There is a tradition that Scarron was buried in the side chapel which bears his name. It is the coat-of-arms of the family of d, of whom Jacques Bétand, President of the Cour des Comptes, was interred there.

THE following inscription is written in a privately-owned copy of Edward Cresy's "Stone Church, Kent" (1840), not included in the library of the Royal Society of British Architects. The epitaph is many years ago from Mr. Cresy's at Horton Kirby, Kent:— "memory of Edward Cresy, of this parish, who died whose quick parts and unwearied might have placed him foremost in his fellows, but if life was to him a sea, yet he found in the ardent and rested study of his profession a shield the slings and arrows of outrageous fortune failed to pierce. He ceased working on the 12, 1858, aged 66. Watch therefore, know not the hour."

association with G. Ledwall Taylor, produced several books, notably the "Antiquities of Rome," which is a standard work of reference.

THE exterior of the charming old Stiftskirche at Baden is to be restored shortly, when the figures over the doorway will be placed in the Museum. Such an act of vandalism should be avoided while there is yet time. The edifice would afford a dangerous precedent. The church contains a magnificent reredos and a beautiful, but attenuated, sacramenthouse, as well as other architectural and decorative features of great beauty.

In the case of many Gothic churches in the upper stages of the steeple are stances, and ugly and heavy at that.

ON September 29, 1600, "Roger Powke, of Ilyte Aston, in Coldfeilde County of Stafford gent and Lucy's wife of th'on partie and the other in consion of 40l. demises and leases for years at annual rent of 6s. 8d. All that the chaferie and Hamer Mill now beinge verye originallye formed part of the Castle Inn. The lordshippe of Ilyte Aston aforesaid of Stafford in a close pasturo or gronde comonlie called or known by the name myells." In these terms an old lease of the letting of a forge situated near gham, and around the site of which dices of tons of metallic iron have been often to the annoyance of farmers in ploughing. The pieces of iron so up are of the same general shape, and from about 20 lb. to 60 lb. each. When each has a round or basin-shaped lower and a level top with a projection some- like a handle. From their peculiar shape they are locally known as "ham-bones."

The metal is not of good quality, and seems to have accumulated at the bottom of a furnace employed for the manufacture of wrought-iron, the "ham-bone" being thrown away each time the furnace was stopped. Similar waste material was produced at Old Witton Forge, now part of Messrs. Kynoch's works, and including a corner of the old Roman camp at Perry Bar.

FOR the restoration of the Shoreditch parish church of St. Leonard, Parish Church, Shoreditch, an appeal is being issued. It is interesting to note that the present structure is the third church built on the site, upon which a Christian church has existed for over a thousand years. The present building dates from 1746, and was erected by Dance the elder, on the demolition of the old structure in 1736. The beautiful chancel window, the gift of Thomas Awsten in 1634, was transferred from the old building.

THIS ancient structure—a fine Felsted Church, specimen of Norman architecture and a well-known landmark in the district—having been reported as unsafe, its restoration has been decided upon. Chief among its treasures is a fine monument to the first Lord Rich, who founded a hospital and the Grammar School at Felsted. At the school were educated Dr. Isaac Barrow, Dr. John Wallis, the famous mathematician, and Richard Cromwell, a son of the great Protector. Robert Cromwell, the eldest son, was buried in the church; the register recording—"Robertus Cromwell filius honorandi viri patris Oliveris Cromwell et Robertus fuit inimicus plus juvenis, Deum timens supra multos." Alfred Wilson, the biographer of James I., also lies buried in the chancel. Among the other mural tablets and monuments is one in the north aisle, which reads:—"Robert Lukin, of Felsted, Bury. 30 years churchwarden of this parish. Born November XXVI, 1749. Died July XIV, 1838."

THE only open-air pulpit in the diocese of Chichester has been erected in the grounds of the Church of Holy Trinity, Hove. It is erected "to the Glory of God for the preaching of the Gospel by a soldier and his wife, A.D. 1912."

AS a memorial of the Coronation of King George and Queen Mary, Mr. Alfred Palmer has presented to the parish church of Horne, Surrey, a new organ, the oak case and side screen of which have been constructed from wood taken from some old 15th-century buildings, probably erected out of the ruins of the once flourishing Reading Abbey. Horne Church is a small building of very uncertain date, containing several memorials to the Hope family.

A RATHER rare type of lectern, Lectern, Caistor, has recently been placed in the Church of Caistor as a memorial of the twenty-five years' vicariate of the present Vicar, the Rev. W. F. Westbrook-Westbrooke. The reading-desk is supported by four figures standing on a finely-wrought pedestal, whereon are placed two beautifully-carved figures of St. Peter and St. Paul, the patron saints of the church. The whole of the work has been fashioned in old English oak.

THE Old Castle Inn at Kingston.

ONE of the oldest buildings at Kingston-on-Thames, dating back to the Tudor period, is now being pulled down to make way for a new building for Parr's Bank. The building originally formed part of the Castle Inn. The Castle Inn is mentioned in works of Tudor and subsequent times. In more recent times portions of the old inn were adapted for business purposes, and the grand staircase of carved oak, which is one of the finest examples of Tudor work extant, was carefully preserved. When the present owner, Mr. J. P. Waters, purchased the building many efforts were made to induce him to sell the staircase, for which as much as 900*l.* was offered, but he declined to part with it, and now he has had it carefully removed, restored, and re-erected on new premises which he has constructed on part of the old site. During the work of demolition some other interesting archaeological relics have been

uncovered, including two very fine doorways carved out of solid oak; a part of the original main wall of the Castle Inn, a fine example of the oak beam and wattle and daub style of the period, and a strip of tapestry, evidently of great age, and bearing the inscription in old English letters: "The Prodigale Son wasteth his goodes among harlates." These relics have been offered by the builder to the local municipal museum.—*The Times*.

THE ancient tower of St. Margaret's Church, Upton, which was erected in 1170, and nearly destroyed by a tempest in 1550, has at last been put into repair. The church itself was carefully restored some thirty years ago, but the completion of the work, which had included the restoration of the tower, had to be deferred owing to lack of funds. In 1602 the Archdeacon reported "the steeple raynted long since through the default and negligence of the parishners." William Wynne was buried in the south aisle of this church in 1505, and in his will said:—"And I will have a gravestone the price of 26s. 8d. to the stonage of the church, 29 marks if need be more to St. Peter's Guild 6s. 8d." The church was originally a rectory dedicated to St. Margaret, valued at 25 marks, and granted by Ralph de Glanville, Lord Chief Justice of England, to the Priory of Butley, in Suffolk. This was confirmed by John de Grey, Bishop of Norwich, William de Raleigh, Bishop, etc. On the appropriation, a vicarage was settled valued at 10 marks, the Vicar having a pension of 30s. per annum, payable by the prior.

THE Vicar and Churchwardens of this riverside church, which has been immortalised by Dickens—have issued an appeal for the repair and restoration of the tower. The present edifice is Byzantine in style, and was erected in 1752 upon the site of an older structure by Mr. Wright, some time clerk of the works at Hampton Court Palace. For a considerable time the church was an unsightly brick building of little or no architectural pretensions, but its appearance has since been greatly improved by the insertion of windows and other structural alterations, including the provision of a porch at the west end enriched with arcades at the sides and with decorative carvings, and a semicircular chancel. The edifice is, in fact, one of the cleverest transformations from a "churchwarden" structure to a Byzantine church to be seen in the country. The tower, which is a conspicuous object viewed from the river, is surmounted by a parapet and a peculiar cupola. A monument to Lady Jane, sister of Philip, Duke of Wharton, and the last of her noble family, graces the south wall of the church. The riverside churchyard is crowded with ancient tombstones, the majority of which, however, do not call for special mention.

THE Campanile of Pisa, which owes its celebrity to its leaning position, is now regarded as being in a dangerous condition from the same cause. It is 180 ft. high and more than 13 ft. out of the perpendicular, the angle of the slope increasing slowly but steadily. The Commission appointed to report upon its state by the Italian Government appears to regard its ultimate collapse as impossible to avert. Mr. D. Livingston, C.E., in an interesting letter to a contemporary, which he has communicated to us, suggests a remedy. With most modern authorities he maintains that the tower was originally built upright, in view both of the appearance of the masonry and of a relief carved in oak in the cathedral in which it is thus represented. This latter piece of evidence should bring conviction to those, if any are left, who maintain the opposite view, for it is inconceivable, if the tower had been purposely built sloping, as a curiosity, that this striking characteristic should have been ignored in a local representation.

Mr. Livingston's suggestion is that an American contractor with experience of the analogous work of moving entire blocks should be engaged to restore the tower to the perpendicular not by raising the sunk side but by pumping out the water or sand and water below the raised side, thus allowing it to sink to the lower level, while underpinning the entire structure.

THE BUILDING TRADE.

APPROVAL OF PLANS BY LOCAL AUTHORITIES.

ONE of the duties which falls to the lot of architects and builders is to see that plans of proposed buildings do not offend against local by-laws. Inasmuch as these by-laws vary in different parts of the country, it is necessary for the builder to be acquainted with the exact provisions in force in each district; but much useful information of a general nature can be derived from a study of the cases which come before the Divisional Court from time to time.

It has been decided, in the first place, that a corporation who are the guardians of highways ought not to be compelled by *mandamus* to approve of plans for new houses which, though in accordance with the by-laws, in the honest opinion of that body would interfere with an alleged highway under their charge (*Rex v. Hartlepool Corporation, Ex parte Richardson* (1902); 18 T.L.R. 1).

Failure to submit plans may have unfortunate consequences even after the lapse of a considerable time. Thus in *Fairbrass v. Mayor of Canterbury* (1903; 67 J.P. 181) the owner of an old building constructed of brick with a tiled roof removed the roof and began to build on the walls thereof and upon the surrounding ground a new building. He did this without giving notice to the local surveyor and without delivering any plans, as he was bound to do under the by-law of the Urban Sanitary Authority. Some six months after he had completed the new building he was summoned by the authority to show cause why the new building should not be pulled down, and was subsequently ordered to pull it down. It was held on appeal that, notwithstanding the fact that no plans of the new building had been deposited and that the local authority had not therefore disapproved them, the order had been rightly made. The jurisdiction of the local authority to make the order was not affected by the time that had elapsed since the completion of the building.

It frequently happens that a by-law provides that building must commence before a certain date after the deposit of the plans. In *Harrogate Corporation v. Dickinson* (1904; 1 K.B. 468) a local act provided that the deposit of the plans with the Corporation of any building should be null and void if the execution of the work specified in such plan was not commenced within a certain period. In 1894 the defendant deposited, and the plaintiffs approved, two plans showing eleven houses and two stables and coach-houses. Some of the buildings shown upon the approved plans were erected within the period specified by the Act. After the expiration of that period the plaintiff commenced to erect other buildings shown upon such plans without depositing fresh plans. It was held that the plan of every house or stable and coach-house was a separate plan, although they were all included on the two sheets deposited with the plaintiffs, and that, therefore, the deposit was null and void so far as such plans related to the buildings which were not commenced within that period specified in the Act. Fresh notices and deposits of plans were therefore necessary.

In *re Eastbourne Corporation* (1900; 64 J.P. 724) the prosecutor submitted plans of a proposed building for the approval of the Eastbourne Corporation as required by the by-laws made by them. The Corporation approved the plans as being in compliance with the by-laws, but disapproved them as regarded the building line shown thereon on the ground that the proposed building would contravene sect. 3 of the Public Health (Buildings in Streets) Act, 1888. The prosecutor obtained a rule nisi calling upon the Corporation to show cause why a writ of *mandamus* should not issue ordering them to approve the plans as regarded the building line shown on them. It was held that the Court would not order a *mandamus* to issue, inasmuch as the authority had refused to approve plans which they honestly considered showed a contravention of the provisions of an Act of Parliament.

The most recent case on the question of plans is the case of *R. v. Preston Rural District*

Council (1912; 76 J.P. 65). It there appeared that the owners of a farm submitted to the local authority plans for the erection of new buildings. These plans showed that it was proposed to erect a barn adjoining and attached to the kitchen at the back of the dwelling-house, but there was to be no door between the kitchen and the barn. The by-laws provided that a new domestic building must have an open space at the back. The definition of "domestic building" contained in the by-laws was as follows: "Domestic building" means a dwelling-house, or an office building, or other outbuilding appurtenant to a dwelling-house or an office building, or other outbuilding appurtenant to a dwelling-house, whether attached thereto or not, or a shop, or any other building not being a public building or of the warehouse class. "Building of the warehouse class" was defined as "a warehouse, factory, manufactory, brewery, or distillery." The local authority rejected the plans on the ground that they infringed the by-laws owing to the fact that it was proposed to build the barn immediately in the rear of and adjoining the dwelling-house. The owners accordingly applied to the court for an order to compel the local authority to approve the plans. It was held that as the dwelling-house and barn constituted one domestic building there was no obligation to have an open space immediately in the rear of the dwelling-house, and a *mandamus* must issue to the local authority to approve the plans.

It was held in an older case that a local authority has no right to object to plans merely because of a general objection outside the merits of the plan itself. Thus in *Rex v. Bechill Corporation* (1911; 75 J.P. 385) it appeared that a builder submitted to an urban sanitary authority a plan for a cottage on a beach site, the plan showing a proposal to construct a drain and a cesspool for the purpose of dealing with the sink water. The plan was in accordance with the by-laws. The surveyor to the sanitary authority advised them that as the whole of the drainage system was below the level of ordinary spring tides the cesspool would at such times be filled with sea-water, and the drainage system would be rendered inoperative. The sanitary authority consequently disapproved the plan on the ground that the plan would provide no effective drainage and that no satisfactory system of drainage had been submitted. It was held that the sanitary authority had no right to refuse their approval to the plan because of a general objection.

The former cases were thus summarised by the Lord Chief Justice in the course of his judgment:—"The result of the cases is that if a local authority have refused to approve plans on a ground within their jurisdiction, as, for instance, that they would constitute new streets, but that the formalities in connexion with new streets had not been complied with, then no review of that discretion can take place. I think I have said more than once that the Court will not substitute itself for the urban authority in deciding whether a plan should be approved; but if they decline to approve plans not because of any objection to the plans themselves, but because of some general objection outside the merits of the plans themselves, then I think they must be ordered to approve them."

Finally, it has been held that an action for damages will not lie against a local authority for maliciously refusing to approve building plans.

MOTOR-ENGINE FOR NORWICH.

A POWERFUL new motor fire-engine has been added to the equipment of the Norwich Fire Brigade. It is of the Merryweather patent "Hatfield" design, with reciprocating pump capable of delivering 500 gallons per minute and upwards. It also carries a detachable fire-escape to reach 50 ft., as well as 2,000 ft. of hose, and affords accommodation for a dozen firemen. It must not be overlooked that Norwich is a cathedral city, and efficient fire protection of the sacred edifice is a necessity. A powerful motor fire-engine of this kind, which can turn out instantly and travel at a speed of over 30 miles an hour on the level, is a valuable asset, and it is to be hoped that the time is not far distant when all cathedral cities will be equipped with motor fire-engines.

SCOTCH AND NORWEGIAN GRANITE.

A STRIKING illustration of the difference in behaviour, in a trying atmosphere, of Scotch and Norwegian granites may be seen at present time in Manchester. Some eighteen years ago there occurred the first instance in this town of the use of the light grey Norwegian granite, which is worked abroad imported ready for fixing. This stone is quite distinct, geologically, from the various beautifully coloured granites from Scandinavia, for many years past have been worked polished in Aberdeen. At the time the Norwegian grey granite compared unfavourably with work of a similar type for which Scotch granite was used. The Norwegian stone was of a looser texture and in appearance was as dead as concrete. Almost immediately after its use in Manchester, however, there became apparent a rustiness due to the oxidation of a mineral contained in the stone and this spread and deepened so rapidly for some years past the granite has been of a colour of old iron. Moreover, the material is weathering badly and is becoming friable. The same discolouration may be seen in progress in the Norwegian granite used in two buildings erected at a later date, of which one has not been completed more than a couple of years. In all these respects the Scotch granite shows a marked advantage and this not only when compared with contemporary work, but also if the Norwegian stone be compared with the British granite used in pedestals which were erected sixty years ago. In the latter case the marks are still sharp, and the colour of the stone remains, mellowed indeed, but with no sign of rust, and the surface, far from disintegrating, appears to have hardened and has taken a semi-polish. In Liverpool there is a building in which Scotch granite has been used for the base and Norwegian for the superstructure, and the former is a datum from which the gradual rusting of the latter may be judged.

The reason for this striking contrast may be understood when the different conditions of the Norwegian and Scotch quarries are considered. The older geologists considered all granites were primitive rocks—that is, they originated before the deposition of sedimentary rocks and formed the basis of the earth's crust. It is now recognised, however, that granite is not necessarily an athermal rock but that it may be of any age up to at least the Tertiary. The difference is that where it occurs as a surface outflow and consolidates has taken place freely there is a softer nature and an absence of the interlocking of crystals found in granites which have cooled at great depths under enormous pressures in accordance with a general rule, are in proportion to their depth from the surface. Now this particular granite occurs in Scandinavia as a surface outflow. Apparently it has never been covered by newer formations, which, indeed, are scarcely to be found in the country. It lies in horizontal beds, like sedimentary rock, and is quarried chiefly partly because there is practically no overburden. So bare is it that the stone must be affected by weather, for Professor Geikie mentions a case in which granite has weathered to a depth of 50 ft. from the surface. The most conspicuous instance is the deep pit—200 ft. or 300 ft. of a Scotch quarry reveals altogether different conditions. The granite obviously is of ages older, and signs of strain and stress everywhere. Consolidation has taken place at great depths and under incalculable pressures, and the present appearance of the rock comparatively near to the surface is due to denudation of the strata by which originally it was covered. The superior hardness and weathering qualities of British granite—understood by every user of sets—are due to the sterner conditions of its youth and to the early restraint, and not to its position at the surface, but absolutely necessary to the formation of a strong character. Wherein moralists, should any chance to read this journal, may find a new illustration of an old adage.

The "Express" Concrete-Mixer.

CONCRETE-MIXERS: THE "EXPRESS" MIXER.

Machine, manufactured by the (U.K.) Concrete Machine Company, Ltd., of London-Tyne, was designed by a civil engineer with the idea of reproducing mechanical operation of concrete mixing as done by manual labour.

The machine is of the batch type, the maximum capacity being 5 cub. ft. The materials, when put into the mixer, are first mixed dry, and then added, and the concrete is perfectly mixed in about sixty seconds.

The accompanying illustration gives a full view of the machine and shows the hopper under the pan, as well as the shaft for mixed concrete.

The machine is 6 ft. 6 in. in diameter and 1 ft. 9 in. in height. The middle is a capstan rotated by a belt beneath and carrying four arms, which are fixed plough-blade-shaped stirrers; each of these is attached an iron rake.

The materials are repeatedly turned over and over by the ploughs, the rakes breaking up the concrete turned by the ploughs and so on. By the action of the ploughs the materials are kept level in the bottom of the pan, and the material is sometimes piled in the form of ridges.

When the machine is started, and the agitators are fed dry from a hopper into the pan. Having been mixed dry for about twenty seconds, water is added by means of a spray pipe supplied by an automatic tank.

After this mixing is complete, the material is discharged by opening sliding doors at the bottom of the pan, the material falling away from the gearing by the action of the machine.

The ploughs and rakes constantly revolving in the pan within a few seconds, when the door is closed, another batch of material is shot into the pan, and the operation is resumed without the need for the action of the machine.

The "Express" mixer can be used equally well for dry and wet, its capacity is about 5 cub. ft. per hour, and the power required is only one horse-power. The machine is in the form illustrated, or mounted on a timber carriage with removable wheels.

BRISTOL BUILDING TRADE.

A discussion between the Bristol Master Builders' Association and the operatives in the building trade on the question of rates of wages has now come to a temporary ending. An increase of 3d. per hour has been granted to all branches of the trade, with the exception of general labourers, who obtained this advance in the month of the year, and various alterations have been agreed upon in the general rates.

GENERAL BUILDING NEWS.

CHURCH, EDINBURGH.

A new church is to be erected on the site of Lady Glenorchy's Parish Church, and will provide accommodation for 800 persons. The plans have been prepared by Mr. P. Macgregor Chalmers, architect, of Glasgow.

CHRIST CHURCH, ENFIELD-STREET, W.C.

The renovation of the interior and exterior of the above church is proceeding. Mr. J. Ernest Franck, A.R.I.B.A., is the architect, and Messrs. Rice & Son, of Stockwell, are the builders. Messrs. R. Anderson & Co., of Leadenhall-street, are employed as stepladders. The stonework of the spire has been brushed down with stiff wire brushes, and all surface defects have been made good with Portland cement and washed sand. Three coats of liquid preparation for preserving the stone will be applied, and the iron finial will be scraped and repainted.

NEW BUILDINGS IN LONDON.

Maternity Hospital, Lower Clapton, N.E.: Mr. F. J. Coxhead, builder, Leytonstone, N.E. Factory for Globe Furnace Company, Ltd., office and library furnishes, 44, Holborn-viaduct, E.C.: Mr. F. Dore Clapham, architect, Harley-street, Bloomsbury, W.C. Additions to Berkeley House, W.: Messrs. Wonnacott & Cook, architects, 199, Piccadilly, W. Police-station, Enfield, N.: Mr. F. Dixon Butler, architect, New Scotland-yard, S.W.: Mr. A. Monk, builder, Edmonton. Cinema theatre, near Kew Bridge, Brentford, W.: Mr. S. Spells, Somerset-road, Brentford, W. Branch Capital and Counties Bank and other buildings in Cheapside, E.C.: Messrs. George Trollope & Sons and Colls & Sons, Ltd., builders, 77, Grosvenor-road, S.W.

MESSRS. WAYGOOD & CO.'S NEW PREMISES.

On Tuesday last the Mayor of Southwark, Mr. W. C. Williams, and other municipal officials, were present at Messrs. Waygood's premises in Palmouth-street, S.E., when the Mayor performed the opening ceremony of the new works which have been erected to cope with the development of the business. The new building has a superficial area on the ground floor of 15,500 ft., and on the first and second floor galleries of 11,000 ft., respectively, and in the basement of 6,000 ft. The cubic contents of the buildings are about 750,000 cubic ft., and the total length of the building is 250 ft. Four electric motors of 50 h.p. have been installed by Messrs. Vickers, Ltd., and the space between the galleries is spanned by a large overhead electric crane, which runs the full length of the gallery, and can raise loads up to 5 tons at a quick speed. The contractors for the work were Messrs. G. Parker & Sons, and the sub-contractors were:—Steelwork—Messrs. Walter Jones & Sons; wood-paving—Messrs. W. H. Wheeler & Co. Ltd.; heating and ventilating—Messrs. Haden & Sons; roof work and glazing—Messrs. Hayward Brothers & Eckstein. Mr. M. E. Collins was the architect for the work. The new building is arranged as an extension of one of the existing shops, and forms part of the premises. The height of the building is 54 ft. from the basement to the roof, and the erection is fire resisting throughout, being built with brick walls, reinforced concrete floors and roofs. Fire-resisting staircases and hydrants are fixed throughout, and the heating and ventilation

are of the latest form. The new shop is electrically driven throughout with power obtained from the mains of the Southwark Borough Council. Electric travelling cranes have been installed, and there are also two lifts, one of which is arranged on a patented "electrolift" system, which the firm has lately introduced. In the course of his speech at the opening ceremony, the chairman, Mr. Henry C. Walker, made some interesting remarks as to the business, which was founded in 1833.

TRADE NEWS.

The Council Schools, Athey street, Macclesfield, are being supplied with Shorland's warm-air ventilating patent Manchester grates by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester. The new infirmary, Luton, is being supplied with the firm's double-fronted patent Manchester stove with descending smoke flues. The Siberts-wold Schools, near Dover, are being supplied with warm-air ventilating patent Manchester grates by the same firm.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Baptist Church, Broadstairs.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Space at Rear.

Marylebone, East.—Erection of a building upon the site of Nos. 107 and 108, High-street, St. Marylebone (Mr. J. R. Vining).—Refused. St. George, Hanover-square.—Re-erection of buildings abutting upon Norfolk-street, Green-street, Park-street, and Wood's-mews, Mayfair (Mr. E. Wimperis for the Grosvenor Estate).—Consent.

Lines of Frontage and Projections.

Bow and Bromley.—Erection of porches in front of nine houses on the northern side of Ridgale-street, Bow (Messrs. E. Evans & Sons for Mr. M. A. Braunstein).—Consent.

Hackney, North.—Erection of porches, bay-windows, and oriels to houses on the northern side of a street leading out of the eastern side of Upper Clapton-road, Hackney (Messrs. J. Hamilton & Son for Messrs. O. & L. Chillingworth).—Consent.

Hammersmith.—Building on the southern side of Hythe-road, Hammersmith (Messrs. A. J. & C. Hocking).—Refused.

Lewisham.—One-story shops in front of Nos. 344 and 346, High-street, Lewisham (Mr. G. E. Beaumont).—Consent.

Marylebone, West.—Erection of a building upon a site abutting upon Marylebone-road, Edgware-road, and Brown's-court, St. Marylebone (Messrs. Gale, Durlacher, & Emmett for Mr. Davis).—Consent.

Paddington, South.—Iron and canvas roof over the northern end of Inverness-mews, Queen's-road, Bayswater (Messrs. Harvey & Potter).—Consent.

St. Pancras, South.—Four projecting features at University College, Gower-street, St. Pancras (Professor F. M. Simpson for the Committee of the University of London).—Consent.

Walworth.—One-story portion with a projecting clock in front of Nos. 42 and 44, Old Kent-road, Walworth (Messrs. Zeph. King & Son).—Consent.

Woolwich.—Conservatory at No. 46, West-mount-road, Eltham, abutting upon Greshiel-road (Mr. E. H. Wright for Mr. J. T. Alderton).—Consent.

Width of Way.

City of London.—Buildings abutting upon Red Lion court, Fleet-street (Messrs. Watson, Sons, & Co.).—Consent.

Hampstead.—Erection of a conservatory at No. 70, Fitzjohn's-avenue, Hampstead (Mr. S. C. Lathbridge for Mr. W. Gaisberg).—Consent.

Width of Way and Lines of Frontage.

Hammersmith.—Addition at Temple Lodge, Queen street, Hammersmith (Mr. A. H. Woolf for Mr. H. Brooks).—Consent.

Kennington.—Erection of buildings on the north-western side of Upper Kennington-lane, Kennington, between Nos. 36, Upper Kennington-lane and Courtenay-street (Mr. G. Bartlett for the Duchy of Cornwall).—Consent.

Strand.—Showcase at No. 224, Regent-street (Messrs. T. & J. Perry).—Consent.

Lines of Frontage and Construction.

Bow and Bromley.—Iron and concrete timber drying stage at Tredegar Works, on the south-

FINCHLEY UNITARIAN CHURCH, GRANVILLE-ROAD.

The building, completed last November, is the first part of a scheme for a new church with church hall, classrooms, and other accommodation necessary for Sunday-school or institutional work. Owing to the shape of the site, with frontages on Granville and Montrose roads, a plan was adopted on radial lines, the point of approach from the main road being Golder's Green and Tallyho.

The exterior is carried out in roughcast, brown brick facings and green West-slates.

The internal woodwork is in deal, stained and unvarnished, and the floors are of pine wood block, American oak being used in the hall. This room is at present reserved for services, and will seat over 200. A balcony over the entrance-door for a lantern, and the door from the hall is fitted as a serving hatch for refresh-

ments. Rooms are heated by radiators from a boiler under the kitchen.

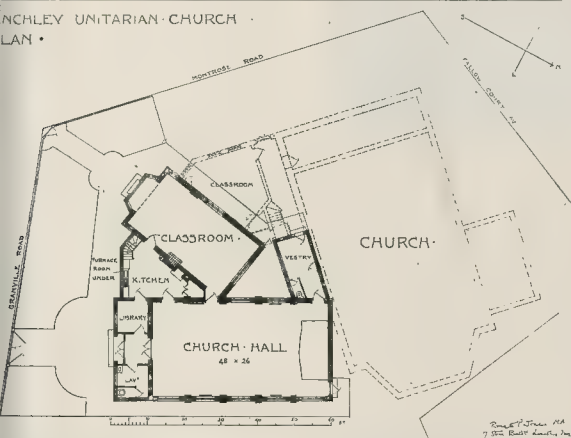

The architect was Mr. Ronald P. Jones, of Stone-buildings, Lincoln's Inn, and the contractor Mr. J. A. Hunt, Hoddesdon. The building was erected by Messrs. Messenger & Co., and lighting by Messrs. Francis Reade.

Unitarian Church Hall, Finchley: Interior.

Mr. Ronald P. Jones, M.A., Architect.

FINCHLEY UNITARIAN CHURCH PLAN.

Tenders.—The following tenders were accepted:—Construction of engine and pump-house, formation of roads, etc., at Fortis Green—Messrs. J. Chessum & Sons, 5,684*l.* 14*s.* 11*d.*; erection of engine-house and new works at Cricklewood—Messrs. J. Chessum & Sons, 5,075*l.* 1*s.* 4*d.*; laying of conduits, etc., in the Waltham Abbey and Chingford district—Messrs. Airds, Ltd., 854*l.* 7*s.* 7*d.*; repairs to the Board's cottages at Surbiton—Messrs. Gaze & Son, 425*l.*

METROPOLITAN ASYLUMS BOARD.

The following, amongst other matters, were dealt with at the fortnightly sitting of the Board on Saturday last week:—

Works.—Tenders for works were accepted as follows:—Repairs to paving at Darenth Industrial Colony—Messrs. Holman, South Bermondsey, 239*l.*; repairs to terrazzo paving at Joyce Green Hospital—Messrs. Diespeker & Co., Holborn-viaduct, 140*l.*; road and paving repairs at Western Hospital—Messrs. W. Griffith & Co., Ltd., 393*l.*; road and other repairs at the Down's School—Messrs. Bristow & Co., 540*l.* 0*s.* 5*d.*; cleaning and painting works at the Bridge Industrial Home—Messrs. A. F. Lewis & Sons, Witham, 195*l.*

Darenth Asylum.—A plan was approved for the provision of office accommodation for the steward and clerks at the above Asylum.

METROPOLITAN WATER BOARD.

At the monthly meeting of this Board on last week, the following matters were dealt with:—

Surveyors.—The Works Committee, as to the present unsatisfactory position in regard to the employment of surveyors, owing to the variations in the quantities quoted by the selected firms; and made the following recommendations:—That the Board be referred to the Works and Stores Committee to prepare a list of the prices which should be paid to quantity surveyors for taking out quantities in connection with the estimated cost of which exceeds 10,000*l.*; to invite quantity surveyors in London to state whether they are prepared to take out quantities on the Board at such prices and on the conditions contained in the model contract now submitted; that the Board be referred to the Works and Stores Committee to select firms to take out quantities in rotation in respect of such quantities in the case of all future works the cost of which exceeds 10,000*l.* tenders to be received in such case (where necessary) for taking out of quantities on the terms and conditions contained in the before-mentioned model contract; that the Works and Stores Committee be authorised to accept, from time to time, such of the tenders received as appear to be most favourable to the interests of the Board, and that the seal of the Board be affixed to all documents in the matter of the same.—Agreed.

Unitarian Church Hall, Finchley: Exterior from the South.

Mr. Ronald P. Jones, M.A., Architect.

Chiselborough Church, Somerset: Present Appearance, with Norman Arch Exposed.

THE PARISH CHURCH, CHISELBOROUGH.

UNDER the superintendence of Mr. F. Bligh Bond, F.R.I.B.A. (Hon. Diocesan Architect for Bath and Wells), and his partner, Mr. W. E. Ellery-Anderson, the parish church of Chiselborough, Somerset, has been restored. The illustrations given on this page show the past and present appearance of the interior, and in connexion with the work some curious facts may be recorded. A scheme had been prepared to render the church more commodious, and the work had been started by the contractor, Mr. Bartlett, of Yeovil. On careful examination of the east wall of the nave, preparatory to repair, there came to light the remains of a fine Norman arch of much larger dimensions than the XIIIth-century one which had been built inside it. The character of the work was bold, and indicated a date not much later than A.D. 1100. The whole of the north jamb, with its moulded abacus and the springers of the arch over, was intact, as well as the base and cap of a small shaft which stood in the nook of the recessed jamb. The shaft was missing, but on the south side, where the old jambs were found standing for half their height, a portion of the nook-shaft was still extant. The old stonework still retained distinct traces of its original smooth limewash, on which stone joints were picked out in lines of dark red according to the early fashion. The discovery of this arch altered the whole complexion of affairs, and it speedily appeared that if an effective restoration could be made and the intrusive inner arch safely removed, then the tower would be so opened up as to obviate all future trouble in the use of the chancel. The architect decided that this was feasible, if sufficient measures were first taken to underpin the tower foundations and to build a solid encasement of blue brick in cement all around the office is the thickness of the tower wall. This was done, and the restoration proceeded in a most conservative manner, many stones of the original series being recovered from the walling around, in which they had been roughly embedded. Certain features, including a shaft for the north jamb and a cap for that on the south, had to be supplied anew by the architect, but

for the rest the old Norman choir arch is now seen once more as it stood before being covered in in the XIIIth century. The Early English arch is preserved, the stones being marked for position, and it is hoped that at some future date it may yet be possible to incorporate it again in the fabric of the church.

LEGAL COLUMN.

The Insurance Act.

In our fourth article on the Insurance Act, July 5, we referred to sect. 91 and Rule 36 made thereunder, which relate to persons employed in an insured trade for the purposes of the business of any person, but not actually employed by him, the person for the purposes of whose business they are employed being termed the "substantial employer," who, in the absence of direction from the Board of Trade, is liable to perform the duties and pay the contributions required by the Act instead of the actual or "immediate employer." We may, therefore, draw the attention of our readers to a direction made by the Board of Trade by Order dated July 2, which came into force with the Act on July 15, by which it is directed that "in the case of workmen employed in building and construction of works where the 'substantial employer' has not an exclusive right to the services of the 'immediate employer,' the substantial employer shall not be treated as the employer for the purposes of Part II. of the Act, but the immediate employer shall be treated as the employer for the purposes of the Act."

The immediate employer to come within the rule must be a person who works himself wholly or mainly by way of manual labour in the business being carried on by the substantial employer. The direction now issued may give rise to some difficulty in determining what is an exclusive right to the services of the immediate employer.

For the purposes of this part of the Act employment for less than a week, but for more than two days, involves the payment of a full week's contributions. During what period must exclusive right be shown to the services of a contractor with men under him? He may be exclusively employed one day and not on another. This sub-sect. (f) of sect. 91, and the rules made under it, appear to make

confusion worse confounded, and, in our opinion, are entirely unnecessary. It surely suffices to make the actual employer liable for the contributions, and a tax collector for Government, without introducing refinements such as are involved by this sub-section of the rules.

Water Board Charges.

The case of Metropolitan Water Board v. Phillips (noted the *Builder*, December 29) has been carried to the Court of Appeal, sect. 8 of the Metropolitan Water Board (Charges) Act, 1907, the water rate is not to exceed 5 per cent. on the "rateable value" of the premises, and by sect. 13, sub-sect. (f), "rateable value" "shall be determined by the valuation list in force at the commencement of the quarter for which the water accrues, or, if there is no such list in force, the last rate made for the relief of the rate or other rate, in which such last-mentioned rate is included."

The Waterworks Clauses Act, 1847, incorporated in the Charges Act, and so makes water rates payable in advance of ordinary quarter days, but sect. 15 of the Charges Act makes the quarterly day of payment April 1, July 1, October 1, and January 1. The Water Board in this action were assessed at two quarters' rates, viz., October 1 to December 31, 1910, and January 1 to March 31, and the question to be determined was what was the rateable value of the premises in respect of these two quarters.

In 1903 the valuation had been altered, supplemental list, and the rateable value of the premises was fixed at 4000. On July 1, 1910, the overseers had put forward a revisional list, in which the premises were assessed at 3992, but on objection the Assessment Committee had reduced the valuation to 2342, and this valuation was signed and returned to the overseers, October 3. The Board claimed on the higher valuation for the first of the two quarters, whereas defendants contended that both quarters should be assessed on the valuation of 2342. The Court below decided in favour of the Board. The Master of the Rolls agreed with the majority in the Court of Appeal held that the "rateable value" settled from time to time by the local authority as duly constituted, "was the provision assessment which, though settled on October 3, was in force on October 1, and related back, and was in force on October 1, and the case is not without difficulty, and represents a dilemma. If, as has now been held, the assessment is retrospective, the Water Board, which is entitled to claim a quarter in advance, has no certain basis for assessing the charge, and, as the Master of the Rolls pointed out, there is no provision in the Act for refunding charges overpaid. On the other hand, and as the Lords have observed, the Water Board, by being put in advance, ought not to retain a larger sum than that due to them. In the case of consideration, for instance, had the assessment of the Board been upheld they would have been paid the quarter on an assessment from any point of view ceased to be in force on October 3, three days after the commencement of the quarter. The Water Board claim

Chiselborough Church, Somerset: Present Appearance, with Norman Arch Exposed.

of fifteen workmen's dwellings in Sydney-road at an estimated cost of 3,150*l.*, and application is to be made to the Local Government Board for sanction to borrow such amount. The question is to be considered as to what the needs are in regard to secondary education. The Surveyor has been instructed to continue the work of laying the kerb and channel in Friern-lane; also to prepare plans and estimates for stone-paving the paths in Oakleigh-road South, The Avenue, and Portion of Friern Barnet-road. Plans submitted by Mr. A. Fairchild have been conditionally approved for six houses in Ashurst-road.

Fulham.—Plans have been lodged with the London County Council by Mr. H. E. Kinton, 42, Cloncurry-street, for sanction to the formation of streets in continuation of Peterborough-road, Carnwath-road, and Hugon-road, the formation of a street out of Broomhouse-road, and the widening of Daisy-lane and Broomhouse-lane, all on the Sullivan Estate.

Hackney.—It has been decided subject to the usual sanction, to pave, with old granite setts, portions of the channels of four roads, which are not at present paved, at an estimated cost of 310*l.*; also to carry out repairs to the remaining areas of the carriageways before mentioned at an estimated total cost of 1,450*l.*

Hammermith.—Electricity mains are to be extended at an estimated cost of 255*l.* Tenders are to be invited for providing additional lavatory accommodation at the Electric Works at an estimated cost of 140*l.* Tenders are also to be invited for paving Stanbury-road as a new street. Plans have been lodged with the London County Council by Messrs. A. J. & C. Hocking, and D. Watney, for the erection of a building in Hythe-road and a music school, etc. in Rowan-road, respectively.

Lambeth.—Tenders are to be invited by the Borough Council, subject to the usual sanction, for the taking out of quantities for buildings proposed to be erected on the Council's Rommarn-road Depot site. A dust destructor is also to be erected on the site, but is not included in the foregoing work. Plans have been approved for Mr. A. H. Williams, enabling him to drain six houses he proposes to erect in Rosendale-road.

Levensham.—The footpaths in thirteen roads are to be repaired at an estimated cost of 99*l.* Plans have been passed for Messrs. J. W. Heath & Sons for the erection of five houses in Arthurdon-street.

Marylebone.—The application of Mr. R. A. Hinds, Wood Nook, Wimbledon-hill, S.W., to construct vaults in Devonshire-street has been granted; as has also an application from Mr. Claude W. Ferrier, 11, Waterloo-place, Pall Mall, S.W., to reconstruct and construct new vaults in Lissosgrove and Bendall-street.

Romford.—Tenders are to be invited by the Rural District Council for relaying the whole length of about 113 yds. of the sewer in Willow-road, Chadwell Heath.

Shoreditch.—The tender of Messrs. Higgs & Hill Ltd., Crown Works, South Lambeth-road, S.E., has been accepted at 1,989*l.* for the construction in ferro-concrete of a bridge over the Regent's Canal, New North-road. The tender of Messrs. J. Grover & Son, Wilton Works, New North-road, N., has also been accepted, at 881*l.* for building a retaining wall along Regent's Canal.

Southwark.—The Borough Council have circulated the other London municipal authorities, asking them to support a resolution passed by their Council, viz.:—"That the attention of the London County Council be drawn to the excessive fees District Surveyors are allowed to charge under the scale fixed by the London Building Act, 1894, for minor alterations in large buildings, and that they be asked to promote the necessary legislation with a view to the amendment of the Act in this direction." Plans have been lodged with the London County Council by Messrs. Buckland & Sarrard, 8, Frederick's-place, Old Jewry, for the erection of buildings on the west side of Walworth-road.

Stoke Newington.—It has been decided, subject to the usual sanction, to pave portions of Brownwood-road with wood at an estimated cost of 2,250*l.*, and to invite tenders for carrying out the work. For renewing the wood-paving in portions of Manor-road and Church-street, the tenders of Messrs. William Griffiths & Co., Ltd., and the Improved Wood Pavement Company, Ltd., respectively, have been accepted for carrying out the work. The estimated costs are put at 2,760*l.* and 1,770*l.* An electricity cable is to be laid in Queen's-road at an estimated cost of 120*l.*

Tottenham.—The tenders of Messrs. G. W. Rowley and E. T. Bloomfield have been accepted at 231*l.* 10*s.* 10*d.* and 366*l.* 2*s.* 8*d.* for making up portions of Bromley road and Craven Park-road, respectively. The Engineer has been instructed to prepare plans and estimates for making up portion of Keston-road.

Twickenham.—The Council have decided to make application to the Local Government Board for authority to prepare a town-

planning scheme on land situated partly in Twickenham, Heston and Isleworth, and Ham. Plans have been passed for Messrs. Novell Parr, & Kates, to enable them to carry out alterations and additions to "The Nelson Inn," Hampton-road. Mr. H. G. Alway has lodged plans for the erection of four houses in Whittow-road.

Wandsworth.—The Engineer has been instructed to proceed with the work of forming a footpath, with granite kerb, on Streatham Common at an estimated cost of 255*l.* The tenders of Messrs. E. Parry & Co. have been accepted for carrying out the following works at the prices mentioned:—Paving works in connexion with the widening of part of Beechcroft-road, Balham, 208*l.*; paving Gatwick-road, Southfield (footpaths with Victoria interlarded), 679*l.*; paving part of Beechcroft-road, Balham (footpaths with Aberdeen adamant), 1,198*l.* The tender of Mr. Thomas Adams has also been accepted, at 195*l.*, for paving part of Seeley-road, Tooting. In this case footpaths are to be paved with Aberdeen adamant. Tenders are to be invited for flagging the footways of Grove-road, Balham, also for constructing a sewer in a part of Wimbledon Park-road, Southfield. The following plans have been passed:—Mr. J. Uglov, motor garage, South-road, Springfield Mr. F. E. Caine, fourteen houses, Kirkstall-road, Streatham; Mr. D. Whitecher, thirty-four houses, Badminton road and Nightingale lane, Balham.

Willesden.—Plans by the Engineer have been approved for making up Victoria-mews, Kilburn. Tenders are to be invited for making up Wotton-road, and application is to be made to the Local Government Board for sanction to the borrowing of 243*l.*, the estimated cost of the work. The Electrical Engineer reports that the Duplex and General Bearing Company propose to erect large works near Oxgate-lane. Plans have been passed for Mr. F. J. Potter, for the Dairy Supply Company, for the erection of new factory in Chiswick-avenue, Park Royal, also for Mr. G. A. Sexton for the erection of eleven blocks of flats in Rutland Park, Willesden Green. Messrs. G. & J. E. Ball have lodged plans for the erection of eleven houses in All Souls'-avenue.

OBITUARY.

Mr. R. W. B. Browning.

Mr. Robert Wiedmann Barrett Browning, who died on July 8 at Asolo, aged sixty-three years, was the son of the poet. On quitting Christ Church, Oxford, he went as an art student to Paris, and became an exhibitor of both sculpture and paintings in the Royal Academy, Grosvenor Gallery, and the Salon. He was the sculptor of the bust of his father in the Browning Settlement, Walsworth. Soon after his marriage, in 1897, to Miss F. Codrington, of New York, he bought the Palazzo Rezzonico on the Grand Canal, Venice, where he died in 1899. He subsequently purchased the "Pippa's Tower" at Asolo, where the funeral took place on July 10.

Mr. A. O. Maskell.

Mr. Alfred Ogle Maskell, F.S.A., died at Downside, Bath, on June 27, aged sixty-seven years. Upon his return to England from New Zealand in 1874, he became unofficially attached to the Art Library, South Kensington Museum, for two years; he represented the department at the Munich International Exhibition, 1876, and at Brussels in 1880; in the latter year the now Board of Education appointed him to proceed to Russia as representative of the department, and of the South Kensington Museum in the collection of objects illustrative of Russian art. Mr. Maskell was Superintendent of the Musical Section, Inventions Exhibition, 1885, and of the Pictures Section, Colonial Exhibition, 1887. In 1906 he was Cantor Lecturer, Royal Society of Arts; he was for a long period librarian and curator of their museum and collections, to Lord and Lady Brassey, for whom he superintended the erection and arrangement of their Indian Room and Museum, Park-lane. He wrote many articles and papers upon art and kindred topics; he was the author of *Russian Art and Art Objects in Russia, 1884*; *A Catalogue Raisonné of the Engraved Works of Raphael Morghen* (privately printed, Chiswick Press), 1879; *Ivories, 1905*; *Wood Sculpture, 1911*; and with Mr. Robert Demachy, *Photo-Aquatint, 1897*.

Mr. T. Binnie.

The death, on July 11, at his residence in Park-gate, Glasgow, is announced of Mr. Thomas Binnie, aged eighty years. Mr. Binnie succeeded to his father's business, and stood in the foremost rank of valuers and surveyors in Scotland. He was Past-Chairman of the Scottish Committee of the Surveyors' Institu-

tion, and a member of the Commission Enquiry into the house-building system in Glasgow. His services were employed in purchase or sale of many large landed properties, and in several important assessments and compensation cases and arbitrations.

FOREIGN AND COLONIAL.

Industrial Academy, Austria-Hungary.

According to the *Zentral Anzeiger für öffentliche Lieferungsverwesen*, the municipal authorities of Pilsen have approved the plan and estimate for the erection of an Industrial Academy at a cost of 765,000 kronen (about 32,000*l.*). A college building will also be erected this year at Pilsen at a cost of 1,870,000 kronen (about 78,000*l.*).

Trade Conditions in Winnipeg.

The Imperial Trade Correspondent, Winnipeg (Mr. J. Appleton) reports extraordinary activity in building has increased the demand for supplies used in construction, a demand to which no United States firms give special attention, the result that their business has very largely increased, except in the case of terra-cotta. In the selection of interior fittings, built hardware, and the general equipment of buildings, the opinion of the architects employed usually prevails, and they determine the character of the purchases. It is of the utmost importance, therefore, that the firms engaged in the manufacture of building equipment of any kind should keep architects well informed as to the merits of the products they offer, and the market is desired. In this respect the representatives of United States firms are particularly active. Supply firms catering for wants of builders do not as a rule keep stocks, but act as agents for the procuring of the supplies specified by architects. The proximity of the United States to Canada is often the deciding factor in securing building supplies from there, because of greater certainty in getting delivery at a specified time. As the population of Western Canadian Provinces is rapidly increasing, it follows that trade opportunities will increase correspondingly. Winnipeg the chief trade centre for the provinces of Manitoba, Saskatchewan, and Alberta, its trade has very largely increased during the past year. In consequence of this increase is apparent from the fact that much capital expenditure in the territory which that spreads is already arranged. In the case of the railway companies, appropriations are ready set aside for employment of men in the three prairie provinces to the aggregate 50,000,000 dollars (about 10,278,000*l.*) to be expended in constructing and equipping new railways. Incident to this expansion local trade opportunities arise for the supply of building materials for the towns that spring up on the newly built lines, and also the supply of the necessities for the new population. Local conditions determine the character of these equipments, and so far either Canadian or United States industry has successfully them. The demands this year, however, are very much greater than usual, because of the large, general immigration, the purchase power of the immigrants being increased by the large number of settlers with money coming from the United States. This factor in trade stimulation in the Canadian West this year will be, in the opinion of the Trade Correspondent, the unusually large capital expenditure in building and in reconstruction. Although for some years it is probable that these expenditures will be factors in the upbuilding of a very large promising territory, it would not be reasonable to assume that in proportion to population much money will, after a lapse of some years, be invested annually in the two enterprises referred to. Present conditions afford a warrant unusual expenditures, but they can be regarded as permanent factors in determining trade conditions, so much as reconstruction and so much structural building in new towns and cities being an aboriginal condition. Following the extension of the ways into unsettled parts of the West, and the villages with spring up, and the inhabitants, and those of the districts adjacent to them, become settled, they will have wants than those of shelter and implement husbandry. Attention is drawn to the part of shipping agents in the United Kingdom, marking packages with the words "made in Canada," by which the consignee is expected to identify them when they reach their destination. This practice has led to much confusion in Winnipeg. Consignees prefer to have full names and addresses on each package, this greatly facilitates handling.

List of Competitions, Contracts, etc.

Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are used in this number:** Competitions, iv.; Contracts, iv. vi. vii. x.; Public Appointments, xvi.; Auction Sales, xxi. conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

Cardiff.—**FIRE-STATION.**—The traction invite designs and estimates for a new station in Westgate-street. Mr. Mackenzie, assessor. Particulars in Mr. Clerk, City Hall, Cardiff.

Saxon Spill Prize.—Fifty medals, offered for essay on "The History of the Saxon Spill." Particulars from Mr. H. H. Jones, 10, Buckingham Palace.

1. Goole.—**MUNICIPAL OFFICES.**—1. and 161. Particulars from Mr. Council Offices, Goole.

2. Chorley.—**SCHOOL.**—The Chorley Committee invite designs for a school for about 600 children. See tender in issue of July 12. Premiums £100. Deposit, 21/2s.

30. Dublin.—**UNIVERSITY COLLEGE.**—Designs—Limited to architects in Ireland. Mr. H. T. Hare, F.R.I.B.A.

Ottawa.—**MOVEMENT TO KING.**—Sketch models in plaster to be submitted to the National Art Gallery, Ottawa.

4. Glasgow.—**DESIGNS FOR EXTENSION OF MUNICIPAL BUILDINGS.**—The Glasgow Municipal Architects invite designs for the extension of the Municipal Buildings. Five will be submitted complete drawings in final stage. See advertisement in issue of June 22.

5. Huddersfield.—**TOWN PLANNING.**—The Huddersfield Corporation invite designs for laying-out of certain areas within borough and part of an adjacent area. See advertisement in issue of June 22.

Jordanhill, Glasgow.—**PROPOSED** extension of the Municipal Buildings. See advertisement in issue of June 22.

6. Motherwell.—**HIGH SCHOOL.**—Dr. Burnet, assessor. Deposit, 11/2s.

7. Glasgow.—**MUNICIPAL BUILDINGS.**—The Glasgow Municipal Architects invite designs for the new Municipal Buildings. Five will be submitted complete drawings in final stage. See advertisement in issue of June 22.

Contracts.

BUILDING.

1. Bradford.—**DWELLINGS.**—Erection of dwellings (Blocks Nos. 6 and 7). Particulars from the City Architect, Bradford.

2. Edinburgh.—**LAVATORIES.**—Reconstruction of the lavatories at the General Hospital, Edinburgh. Drawings, specifications of the conditions and form of the contract seen, and quantities of the work. See advertisement in issue of June 22.

3. Leicester.—**CULVERT.**—For the erection of a culvert and approaches at the Leicester and Leicester Road. See advertisement in issue of June 22.

4. Leicester.—**DEPOT.**—For the erection of a depot and approaches at the Leicester and Leicester Road. See advertisement in issue of June 22.

5. London.—**WALLING.**—Erection of walling and iron railings at the Home Office, Elder-road, West Norwood, S.E. See advertisement in issue of June 22.

6. London.—**WALLING.**—Erection of walling and iron railings at the Home Office, Elder-road, West Norwood, S.E. See advertisement in issue of June 22.

7. London.—**WALLING.**—Erection of walling and iron railings at the Home Office, Elder-road, West Norwood, S.E. See advertisement in issue of June 22.

8. London.—**WALLING.**—Erection of walling and iron railings at the Home Office, Elder-road, West Norwood, S.E. See advertisement in issue of June 22.

July 23.—Manchester.—**CONVENIENCES, ETC.**—For conveniences and waiting-room, Clowes-street, West Gorton; shelter at Stevenson-square; conveniences and waiting-room, Moston-lane; alterations to Brooks's Bar Tram Office. Drawings seen, and specification and quantities from the City Architect, Town Hall, on deposit of 10s. 6d.

July 23.—West Hartlepool.—**EXTENSION.**—For extension to the existing battery-room at the Electricity Works, Burn-road, West Hartlepool. Plans, specification, and quantities from Mr. H. E. Friederichs, M.Inst.C.E., Borough Electrical Engineer, Corporation Electricity Works, Burn-road, West Hartlepool. Deposit of 11. 1s.

July 24.—Manchester.—**SPRINGS.**—For laying out and forming a covered, yard for motor ambulances, etc., at Workhouse in New Bridge-street, Manchester. Plans seen, and quantities from Mr. A. J. Murtagh, architect, 93, Strutt-street, Manchester, on deposit of 10s. 6d.

ARCHITECTS AND THE INSURANCE ACT.

VIEW of the heavy responsibilities which fall upon architects at all times, we feel that it is most desirable to give our readers some indication of the additional that are now placed upon the on, and to deal with some of the points that are likely to be met w that the Insurance Act is in on. The scope of the Act is y familiar to everyone by this

"Explanatory Memorandum," and immediately after the Insurance l passed through the House of ns, the Government set forth a their view, was the object of the In this official document we d that the Act "is intended to wide an insurance as possible of industrial population against sick- and breakdown." We have no to attempt a definition of the on "industrial population," but tly it does not include persons ay become employed during the of qualification for a profession.

Architects, surveyors, engineers, solicitors, and possibly doctors, may, and in many cases do, both before and after actual qualification and practice, become employed in such a way as to bring themselves and their employers within the provisions of the Act. Employment under any contract of service or apprenticeship, subject to certain limitations and exceptions, is sufficient to render anyone compulsorily insurable under the Act. A contract of service clearly exists wherever the person employed is required to carry out the work personally and in obedience to the orders or directions of the employer. If the employee has the right to employ someone else to do the work, or if he is at liberty to do it in any way he thinks best, there is no contract of service. Obviously, therefore, the assistants of many professional men will come within the scope of the Act, and, in the case of architects, at any rate, such assistants will consist almost wholly of men who are waiting and gaining experience for the practice that may or may not come. Such persons, as we have already said, form

no part of the "industrial population," and in so far as they are in fact included in the scheme, they appear to have been blown in by a side wind. Indeed, there is every indication that their inclusion is not only incidental but accidental, and contrary to the expressed intention of the Government, who apparently never contemplated anything of the sort.

Be that as it may, architects and their assistants have to consider their position under the Act; and it is impossible to read the Act itself without coming to the conclusion, quite apart from official declarations, that no effort has been made to make any provision in respect of the rather peculiar conditions of employment existing in the profession. Whatever may be the merits or demerits of the Act in relation to those whose conditions of employment may be said to justify its place on the Statute Book, we fear that to most architects and their assistants it will bring little besides annoyance and inconvenience.

What, then, is the position under the Act of those who work in various

capacities in an architect's office? In the first place, articulated pupils are not within the Act; they receive no wages, and are, therefore, within the exception in the first schedule relieving unpaid apprentices and learners from the obligation to insure. Improvers who remain without salary in the office after their articles have been completed are in the same position. But the position of a paid assistant is very different. He is no longer a "learner" in the sense in which the term is used in the Act. He enters into the service of an architect because he lacks the experience or the opportunity to practise on his own account. To obtain professional work of his own is, of course, his one object and ambition. When he is beginning to get occasional work of his own—when he is on the borderland of practice—he may cease to be continuously employed as assistant, and become intermittently employed in the same or different offices, or he may be able, while still retaining his position as paid assistant, to carry out such work as he may get on his own account, until the opportunity occurs for starting an office of his own. Under these various conditions the Act may very well produce not only annoyance, but problems not easy to solve.

The Act provides, as we have said, that all persons employed under a contract of service or apprenticeship must be insured except those who (amongst certain other excepted persons) are employed "otherwise than by way of manual labour and at a rate of remuneration exceeding in value 160*l.* a year." This exception, of course, covers the case of an architect's assistant if his salary is above the prescribed limit. It must be carefully borne in mind, however, that the test as to whether an assistant is or is not within the Act is not the total income he obtains from his employment, but the *rate* of his remuneration. From several "explanations" of the Act, both official and unofficial, which we have seen, it might be, and in many cases has been, supposed that anyone who can satisfy the Commissioners that his earnings during the year amount to more than 160*l.* may be excepted from the Act. As the Act stands this is not so; and, apart from any regulations that may be made as to average of pay over a period, if an assistant is employed, say, for six months in the year by an architect at a salary of 3*l.* 1*s.* 6*d.* a week (i.e., at the rate of 160*l.* a year) or less, he must be insured, even though during the rest of the year he may earn enough to raise his total earnings to more than 160*l.* for the year. On the other hand, if the assistant is paid a salary at the rate of three guineas a week, or 14*l.* a month or over during any part of the year, he need not be insured for that period, even though his total earnings for the year be less than 160*l.* If it were otherwise, it would be necessary to wait until the end of the year before he or his employer could say whether he was required to be insured or not.

Difficulties may, however, very well arise where an assistant is employed successively at different rates of pay by different employers. It happens not infrequently that a young architect, in order to gain different kinds of experience,

passes from one office to another and from one rate of pay to a higher or lower rate. The result may be that he is compulsorily insured for part of the time only, or alternately insured and uninsured. For instance, A., a young architect, may work as draughtsman for X. from January to March at 3*l.* a week. He must for that period be insured, and A. and X. must pay their contributions of 4*d.* and 3*d.* respectively. But if A. then leaves X. and from March works as Y.'s assistant for a year at 4*l.* a week, he ceases to be insured, or rather his insurance is suspended for that period, because his rate of remuneration has risen above 160*l.* a year. He cannot, even if he wishes, for that period become a voluntary contributor, because he is still employed, and, in addition, his income from all sources exceeds 160*l.*, which in itself disqualifies him from voluntary insurance under the Act. If he obtains further employment at, say, 3*l.* a week after he leaves Y., he must be insured again; but there appears to be no provision in the Act capable of solving the problem of A.'s position in such a case. He will probably be considered to be a whole year in arrears, but it will hardly be worth his while to make up these arrears, since he may by that time be on the point of entering into practice on his own account.

This is only one out of many conundrums that may well arise, and that can only be solved, if at all, by reference to meticulous details in the provisions of the Act itself, by application to the Commissioners, or by regulations the latter may make. Such problems may indeed be regarded as a spontaneous by-product of the failure to exclude from the Act persons who are merely incidentally employed during the process of fitting themselves for practice as architects. They will undoubtedly cause difficulties and annoyance, but it is probable that most architects will follow the line of least resistance and pay up when required to do so, leaving the problems to look after themselves.

We do not, however, wish to place too much emphasis upon the difficulties that may in practice occur in respect of the insurance of assistants. Many assistants may be in a position to claim the exemption under sect. 2 (1), and in that way escape, so far as they are concerned, the obligations of insurance. Under that section any employed person will be given a certificate of exemption who can prove to his Commissioners' satisfaction that he has an independent unearned income of 26*l.* a year, or that he is mainly relying for his livelihood upon the support of some other person.

The certificate of exemption must be claimed in accordance with the regulations made by the Commissioners on May 22, 1912; that is to say, on the official form which the Commissioners will supply on application. A certificate is only temporary, and may be granted for a year or less. It will be renewed on a further application to the Commissioners within a month before its expiration. It is probable that many of those assistants who were originally articulated will be in a position to obtain this exemption on one or other of the necessary grounds.

The employer is, however, not exempted from his contributions. He must, as his exempted assistant is, pay a rate of 3*l.* 1*s.* 6*d.* a week or less, and stamp an insurance card in his way, and he is not allowed to deduct the 3*d.* so paid from his assistant's salary. The card in this case is sent periodically to the Insurance Commissioners. The amounts accounted in this way will be carried to a separate account, and may subsequently (Commissioners regulate) be applied to the benefit of the assistant in the event of the latter subsequently losing exemption. But it is most probable that a young architect who is on the ground of independent means will never again become an employer's assistant. The architect-employer's contributions will, therefore, find their way ultimately into the National Insurance Fund and will there vanish so far as his assistant is concerned.

It is unlikely that many architects will be concerned in any way with the compulsory insurance under the Act. An architect becomes a "voluntary contributor" if he is engaged in some regular occupation on his own account, and is not mainly dependent for his livelihood on his earnings from that occupation. He may not become a "voluntary contributor" if his total income from all sources is over 160*l.* The voluntary contributor merely insures himself through the machinery provided by the State scheme. Having no compulsory insurance, he pays 7*d.* a week, and obtains the usual benefits provided by the compulsory scheme, that is to say, 1*s.* a week for twenty-six weeks for which he prevents him from following his occupation, and 5*s.* a week for which he is unable to resume his occupation, and medical benefit, which (if a settled case arrived at with the doctors) will be free medical attendance, and (if the sum in money will, we understand) paid to his approved society, or to make their own arrangements for a sanatorium and maternity benefit. The case of a young architect in the practice who is mainly dependent on the proceeds of his practice, but whose income from all sources does not exceed 160*l.* a year, is, we think, a very rare one, and the interest of the professional voluntary scheme of insurance is in such a case small.

Architects and their assistants in one sense, be said to be engaged in the building trade; but they do not fall within the unemployment provisions of the Act (Part II.), since that relates to those who are "workmen" or "workmen" are defined as persons sixteen or upwards who are employed mainly by way of manual labour under a contract of service with an employer.

The main difficulty, therefore, which affects architects is the question of intermittent employment. The alternative of salaried employment as assistant, with occasional periods of practice on his own, rises to practical difficulties that are impossible at present to anticipate. It is open to the employer, whenever he is undecided whether he is obliged to employ a particular employee, to take him on three courses. He may treat the employee as a person whom he must insure

3d., and deduct his employee's salary whenever it is paid. In case the insurance card must be paid with a 7d. stamp in the ordinary manner the salary is paid. In the place the employer may settle his by writing to the Insurance Commissioners, stating the facts, and he must abide by their decision, or his employee desire to appeal to County Court. The third course of him is to do nothing at all. If he does nothing and to assume particular employee need not be he, of course, runs the risk of a fine for each offence, and also to the employer to recover the of any benefit the latter has lost on account of the employer's failure to him. On the whole, the better to obtain the decision of the Commissioners. But in most cases an will be able to decide for himself he must insure a particular at or not since the test of the rate remuneration, to which we have referred, is the main thing for him. In some cases, perhaps, his may raise the salary of an to so as to exceed the rate of 160l. Finally, we may add that an architect nor any employer should doubt himself about the total of any employee; the rate of pay he need consider for this purpose. As, of course, may arise as to a particular assistant is under contract of service, but whenever any doubt on this point he should obtain the decision of the Commissioners. We may say in conclusion that the should be administered through the Societies, and that those who are insured to be insured can only obtain the benefits which the Act provides for one of these Societies before the 15th of this year. Architects, of course, should endeavour to persuade their assistants to be compulsorily insured to one of these Societies at once. In another column a correspondent has made the suggestion that the Royal Society should consider whether it is to form a special approved for the purpose of administering in the interests of architects and assistants. We feel that, however, it might be to take this course the number of insured assistants were to be, the actual number of assistants insured will be too small to be successful. The exceptions and reasons which we have dealt with will, we believe, be so numerous that the number of the insured assistants will be comparatively few. But we do not wish to express any final opinion on the subject.

LECTURES ON ART.

On Monday asked the Secretary of the National Galleries, and whether, in view of the great interest attending the lectures at the Royal Edinburgh, he can see his way to give a series of popular lectures at the Picture Gallery during the summer months, or on Saturday afternoons, with a view to increasing the public knowledge of and interest in art. Mr. McKinnon Wood replied in communication with the Board of Directors of the National Galleries for their consideration with reference to the suggestion.

THE FOUNDLING HOSPITAL AND THE LONDON UNIVERSITY.

THE announcement that the site for the new home of the London University has apparently been chosen at last rivets attention upon the Foundling Hospital, a building well known to every Londoner for its associations rather than for its architectural qualities. The site, comprising somewhat over nine acres, is a fine one, and, situated as it is in the midst of Bloomsbury, with Brunswick-square on the west, Mecklenburgh-square on the east, and St. George's-gardens on the north, it is bounded by open spaces of considerable extent; and, with the British Museum within a stone's-throw, the *mise en scène* is probably as suitable for a great University as could be found within the London area. It must not be forgotten, however, that a large proportion of the site is already covered with buildings which, though not possessing any particular claims to the consideration of the architect, are nevertheless unobtrusive, while the block, as a whole, is a well-known landmark. We do not know to what extent it may be intended to remove these buildings, but we feel that it would be more than regrettable if the new home of the University, which must, above all, be monumental in conception and worthy of its purpose in execution, should be sacrificed to the temptation to remodel existing buildings which were set up for a very different object. In any case, the transference could not be effected in less than two or three years' time, and it will therefore be possible to develop the estate, form new approaches, erect new buildings, or remodel existing ones without any undue haste. At the moment we feel that our congratulations are due to the authorities on the selection of a site which has much in its favour, though it might have been more advantageous as regards the development of this part of London had one been selected which is now covered with insignificant dwellings and which could be cleared for its new purpose. There would then have been two large areas to develop on fine lines instead of one, and the chances of sacrificing an interesting XVIIIth-century group to the demands of progress would have been lessened.

On the north side of the site is Guilford-street, which forms part of the south-eastern boundary of the parish of St. Pancras; this forms the approach to the Hospital, but it does not follow that eventually it will be the main approach to the University.

Every Londoner is familiar with the statue of Thomas Coram, master mariner, which stands between the entrance gates facing Lamb's Conduit-street. Coram it was who founded the institution, which was established by Royal Charter in 1739 "for the reception, maintenance, and education of exposed and deserted young children." He was actuated by the same charitable interest that inspired the erection of similar institutions on the Continent, notably in Paris and Amsterdam. Actual building operations do not seem to have been begun for several years after the granting of the Charter, for the Governors first opened a house for

"foundlings" in Hatton-garden. Eventually Theodore Jacobsen was entrusted with the work, and the first influx of children into the existing buildings took place in 1745, and ever since that date they may be said to have been occupied to their full capacity. It cannot be claimed for Jacobsen that he made the most of his opportunity, for he produced the dull brick and stone building which, in spite of its dimensions, its setting, and its date, has never excited the enthusiasm of even the least captious critic. That such an important scheme should have been placed in the hands of a man who was a merchant, carrying on business in his earlier days in the Steelyard, is one of those remarkable instances of the amateur architect coming to the front, of which history possibly records too many. "He latterly resided in Basinghall-street, and practised architecture. Besides other buildings he designed the Haslar Royal Hospital for Sick Soldiers at Gosport and the Foundling Hospital, of which he became a Governor. He was a Fellow of the Royal Society, of the Society of Arts, and an original Fellow of the Society of Antiquaries after the granting of its Charter."*

The building consists of a central block with deep projecting wings, symmetrically planned with a large open space in front, where the children may be seen exercising any day, and extensive gardens at the back. The wings originally were connected with the main block on the ground floor only by means of an arcaded gallery; this has been altered, and extensive additions have been made from time to time on the east side and in the rear of the main building. But if the structure has no special interest for the architect, some of the treasures housed there undoubtedly have. William Hogarth was numbered among the earliest Governors; he gave liberally of his money and talent, and the Hospital to this day boasts the possession of three works from his brush, two of which, the portrait of Captain Coram, 1740, and "The March of the Guards to Finchley," 1750, are notable specimens of his work. In the Court Room is a remarkable series of painted medallions depicting the London hospitals—one by Gainsborough—and all forming part of the scheme of the decoration of the room, the plaster festoons and wreaths around the medallions being modelled in harmony with the rich decoration of the plaster ceiling. In the Chapel, which was enlarged in 1872, is an altar-piece painted by Benjamin West, and an organ, which was presented by Handel, though little of the original instrument is left. Handel often presided at performances of his oratorio, "The Messiah," and the proceeds of these most popular musical gatherings substantially filled the coffers of the institution. Whatever may be the ultimate fate of the Hospital building, we may be sure that the heirlooms it now contains will be carefully guarded, and we shall watch the development of the site and its surroundings with great interest and expectation.

* "Notes on the Later History of the Steelyard in London." Communicated to the Society of Antiquaries by Philip Norman, Esq., LL.D., 19 0, and reprinted from "Archæologia," Vol. LXL, with a portrait of Jacobsen, after the fine painting in the Hospital, as frontispiece.

NOTES.

The Old
Globe Room.

IN a recent "Note" we referred to the exhibition in London of the Old Globe Room from the Reindeer Inn at Banbury. Sir Laurence Gomme, in a letter to the *Times*, has also expressed his opinion of this sort of transplanting in much stronger terms than we cared to use. The Old Globe Room has, it appears, after all, been "saved for this country," according to the views of a certain section of the Press. But saved by whom and for what purpose? To be replaced in its natural position or to decorate the mansion of a wealthy Englishman instead of a wealthy American? The air of mystery which has surrounded the whole transaction still remains. First we have the somewhat dramatic removal of the room, followed by a little flutter of agitation in the Press, "Cannot this national treasure be saved?" and so on—the sort of music, in fact, that usually precedes the entry of the American millionaire into negotiations of this kind. The American millionaire duly appears. We do not know whether this gentleman repents of his bargain or not; but with rare magnanimity he wishes to protect this country, as it were, against itself by parting with his bargain at the price he paid for it. This estimable and anonymous American has apparently greater regard for our historical records than we have ourselves. More orchestration in the Press. Then enters the hero of the whole affair, the scion of a noble race, it is whispered (for he is also anonymous), who relieves the American of the room—and a national treasure and British honour are saved, although we are still left a little in the dark as to the ultimate destination of the room. But in its larger aspect this is only the beginning of the drama. There will be a "boom" in the parlours of ancient inns which possess nice examples of Elizabethan, or even older woodwork. Scattered about the country there are many such specimens, which would not, we imagine, be scheduled under any Government Act for the protection of ancient monuments. If we are to enter into competition with America for the possession of these records of the past, it will prove a costly game, and probably will provide a rich harvest for those concerned in their commercial exploitation.

French
Textiles at
Kensington.

THE French *Mobilier National*, the modern department of the Ministry of Fine Arts, which has inherited the treasures entrusted to the *Mobilier de la Couronne* in the days of the Louis, has courteously lent to the Victoria and Albert Museum a very fine collection of Gobelins tapestries, Savonnerie carpets, and silken fabrics, all of which are on view until October in the North Court of the Museum. The tapestries—seven in all—have never before been exhibited outside France. They are reproductions of Raphael's famous frescoes in the *Stanza* at the Vatican, and belong to an early and good period of Gobelins manufacture, having been

executed between 1682 and 1714. The most interesting example is that depicting the Expulsion of Heliodorus from the Temple at Jerusalem, which is lower in tone than the others, owing to the introduction of a metallic thread in the weaving. This is a peculiarly satisfactory piece of tapestry of its period, and shows the Gobelins work at its best. It is worth noting how, in the picture of Apollo and the Muses which was originally painted round an arched window space, the void left by the window has been characteristically filled by the French adapter with a landscape foreground of a stream and swans; while the corresponding space in the *Miracle of Bolsena* is occupied by a relief of our Lord's charge to S. Peter, founded on the Raphael cartoon now at S. Kensington. The four large Savonnerie carpets, part of a set made for Louis XIV., are wonderful examples of early French pile carpet manufacture, though they suffer from the lack of appropriate surroundings. They simply cry out for the salons of Versailles and the furniture of the period. Their design, of course, is not such as appeals to modern English taste—it is too overloaded, too florid, and too restless, but none the less it is of its own type really masterly, vigorously drawn, and, for all its apparent confusion, carefully planned. The silk fabrics—velvets, brocades, damasks, and lampas—belong roughly to the period of the First Empire and the Bourbon Restoration, and are very characteristic specimens of the work turned out by the Lyons weavers. As to the designs, they are of their day and generation, but the colour of some of the lampas, the texture of the velvets, and the fine technique generally will appeal to all lovers of beautiful stuffs. There are many who will be grateful for the opportunity so generously afforded them by the French Government, of seeing some of the most perfect of the national manufactures of their country.

The New
Gallery.

THE vicissitudes of the New Gallery, Regent-street, are becoming difficult to chronicle. The site was once occupied by Newman's livery stables, which were converted into a co-operative meat market. Then, after the secession of the artists from the Grosvenor Gallery in 1887, the New Gallery came into existence on the site, Burne-Jones being the life and soul of the undertaking. Erected by Messrs. Peto Bros. from the designs of Mr. E. R. Robson, who was recommended to the Committee by Mr. Philip Webb, the new building was the scene of the Tudor, Stuart, Guelph, Victorian, and other exhibitions, including many devoted to modern art. The one organised by the Arts and Crafts Society in 1910 was the final one held in the Gallery. Mr. F. T. Verity then made the alterations which transformed the building into a restaurant and Weiner Café. Last week a sale was held of the equipment, and in October, it is understood, the New Gallery Cinematograph de Luxe and Tea-rooms will be opened. "You will enter in Regent-street," wrote Burne-Jones, in reference to the original scheme, "and at once, in five paces, be in a marvellous place reminding you of

Cairo and Damascus, and in a minute, without going up one step, will be gazing on pictures—such happen to be." After about a century this prophecy seems to be as applicable as ever. The same vital æsthetic principles which predominate the present enterprise

Credit to
Whom it is
Due.

A LETTER from Mr. Jackson, R.A., was published in the *Times* of 20th inst., in which tribute was paid to the contributors who have been at work during the past few years in underpinning the foundations of Winchester Cathedral. As a rule, it is the architect who suffers from want of recognition for his professional etiquette, rarely does he prevent him from drawing attention to his work by notice-boards placed on buildings in progress, or by the means open to the general public. Such information, if it should be sought for and obtained, should be public Press when a building is described. The *Times* itself was of a lapse a few days before the publication of the letter mentioned. Referring to the celebrations at Wick School, Yorkshire, and "wonderful chapel finished in the smallest detail that art and wealth suggest," the writer further described the building as "one of the most perfect it is certainly the most striking, modern school buildings of England." Yet the name of the architect, T. G. Jackson, R.A., was left out of the eulogy was robbed of much of its value. When the excellent presiding buildings becomes common, there will be less excuse for such omissions than there is at present.

PICTURE EXHIBITION.

WHISTLER once said to a friend, "What has an artist to do with sentiment? Sentiment is a word for maids," or words to that effect. He was nothing in his conversational writings if not brilliant or paradoxical, verbal fireworks answered the purpose of the moment, and often sounded like a thought, but time has shown that he was only fireworks after all. In his painting, in his etchings, Whistler's most sincere expression of himself was his occasional lapses into argument, literature, and while we are looking at his pictures or his etchings we can discover the meaning of his phraseology and the milkmaid. He was certainly free from the kind of sentiment which dominated the art of British painting at the time when Whistler, in the life and at the height of his talent, denied serious hearing both by his painters and the public. The emotional, the merely pretty effect, which was much in vogue, was certainly the part of his life, and he was influenced by the thought of the early sixties, which began to find expression in the painting, and which sought to in the aspect of life and things, curious as the commonplace aspect of life which were rejected by the Academy. We cannot say that these social conditions were establishing a new of beauty or any new dogma in art, but recall the work of earlier painters

utch, and Spanish schools; but even—the early impressionists, for were experimenting in new theories. Lord Morley, who never himself to a loose statement, said at "history never repeats itself"; only Manet, Degas, and the rest, indebted to certain masters of were not repeating history while in a tradition which at intervals itself in the art of painting. The others carried perhaps the spirit of and warfare, engendered by misunderstanding, and neglect, to Whistler encountered the same, but we can find no expression in of a temper pushed to violence or on. Assertive and in some, less as his personality was, his expression never carried emphasis certain point of suavity and in his insistence upon his own outlook, in his arrogant independence, frank, almost impertinent we recall the picture of a dancing with impatience on the of Paris and flinging insults and to a duel to the Irish critic who led him—all these characteristic of the man never, we think, with the equilibrium of the artist execution of his work. We cannot that Whistler ever approached etching-plate save in a spirit conscious and sincere humility, in of an earnest searcher after the of subtle shades of beauty. We at his position as a painter has yet to shed; as an etcher he surely ranks on and Seymour Haden. With a man much in the public eye as Whistler, personality was so assertive, whose himself was apparently so abundant, let it be said, suffered from so much icule and official antagonism, it is little difficult to dissociate the man from circumstances from his work. The leaves controversy has also certainly the difficulties of arriving at a just of the value of Whistler's actual ment. But apart from these cons, his delicate appreciation for ings in colour was, after all, the a self-conscious and small master, of a great master; he had not the powers, the rich outpouring, of the eters in which self-consciousness is He was a sensitive child of his brought into the art of painting of the neurotic quality which the et-poets of the type of Arthur and Gerard de Nerval—brought into a later epoch. Perhaps he strove, curious and investigating mind, to nances which are beyond either the of words or colour; and which, indeed, are expressed, would not perhaps very far. We have, we fear, in our brief led a little astray from its main which was to call our readers' to the fact that an exhibition of work was opened last week at the Gallery of British Art (the Tate). We are grateful to the Director of try for the enterprise which he has for the choice of his recent special as of work by deceased artists. First the work of Alfred Stevens, then that of onse Legros, and now we have The last exhibition is probably the quietly representative of the three. no etchings; and Whistler's master-portraiture, the portraits of of Sarasate and Carlyle, are probably ibly absent. But these are so well that the gaps may be filled in the of the spectator. We have, on the ad, his famous "Little White Girl," Alexander," "At the Piano," and "little Cardinal," as well as his also, various "Nocturnes" and onies," some of his small more or and figures in pastel, a few studies sky and sea, and two Venetian

pictures, which are sufficient to indicate the breadth of the artist's interest and his care for style.

The London Salon is holding its fifth exhibition at the Albert Hall, and would now seem to have taken a permanent place among our annual picture shows. Architecture is only represented by one set of drawings; greater advantage might be taken by architects of the opportunity which the ample space at the Albert Hall provides for elevations and plans to a large scale which could not find accommodation in the small gallery devoted to architecture at the Academy. Architects are possibly a little afraid of the character of the exhibition as a whole, which corresponds to that of the Independents in Paris, both in the democratic character of its constitution and, as it happens, in the type of work exhibited. London apparently has its *fauves* as well as Paris, although in the latter case they are less fierce, less romantically savage. The value of an exhibition of this kind is that it shows influences, tendencies which are coming into being and which, rightly enough, are not permitted expression on more academic walls. The present exhibition reveals, for instance, an under-world of effort in directions that would otherwise have remained unsuspected. Professor Selwyn Image said the other day at Birmingham that "the basis of art is not cosmopolitan, but national"; we wonder what he would say to this whiff of the Quartier Latin which has blown across the Channel, to these brilliant palettes which were first devised by painters prompted rather by the spirit of scientific investigation concerned with the translation of the laws of illumination and light into terms of paint, than by ideas which more properly belong to the realm which we call art. There are many imitators of this type of work at the Albert Hall, as well as disciples of most of the later wilder movements. Gauguin even finds followers among artists who are probably as great strangers as ourselves to the semi-barbaric life of Tahiti which influenced so largely the character of the French artist's expression.

THE ARCHITECTURAL ASSOCIATION:

SCHOOL OF ARCHITECTURE.

THE usual exhibition which marks the close of the School year was opened by the President, Mr. Gerald C. Horsley, on Friday last, July 19, at 18, Tufton-street, Westminster, S.W., and was attended by a large number of parents and friends of the students, besides many members of the architectural profession.

Mr. Horsley, before announcing the awards for the year, remarked that he need hardly apologise for the fact that merely a small selection of the past year's School work was shown, because he felt convinced that the departure they had made from the usual practice, by exhibiting work executed by past students since leaving the School, was completely justified by the result. From the cursory inspection he had already made of the drawings by the students at present in the School, he was satisfied that the quality was quite up to the standard of excellence to which previous exhibitions had accustomed them. He congratulated Mr. Maule upon the happy inspiration which had induced him, with such success, to bring together so varied a collection of work executed by students who had received their training in the School, and who had since gone out into the world. He was convinced that friends of the Association would view the exhibition with extreme interest, illustrating, as it did, in a most practical way the actual result of the School's system of instruction.

The School in its present form had been in existence eleven years; its curriculum embraced a two-year course in the Day School, followed by a two-year course in the Evening School, the latter being attended by students after leaving the Day School and entering an architect's office. Students who passed satisfactorily through the complete four-year course received a certificate exempting them from

the R.I.B.A. Intermediate Examination. He now wished to announce that a third-year course in the Day School was being instituted, and that the R.I.B.A. had consented to accept this extra year in the Day School as an equivalent to two years in the Evening School, and to grant a certificate of exemption accordingly. In addition to this he was pleased to be able to state that, as a result of negotiations with the Royal Academy authorities, an arrangement had been arrived at whereby students who had completed their three years' training in the Association's Day School would be admitted to the Academy Schools without being compelled to pass the usual preliminary examination in subjects other than design. It would be the policy of the Association to encourage their students to pass on to the Academy Schools, as the advantage to them in being brought into contact with those engaged in the arts of painting and sculpture would indeed be great.

Now that these opportunities were offered he sincerely hoped that the students would make full use of them.

Professor Beresford Pite spoke of the pleasure he had derived from his intimate connexion with the School during the past year in the temporary capacity of Director of Education, and commented upon the enthusiasm which induced the students in the Evening School to apply their energies so admirably to their work in the evenings, after a strenuous day in a busy office.

Mr. H. P. G. Maule, the headmaster, urged the necessity of hard work on the part of the students, and in calling attention to the most notable of the exhibits sent in by past students remarked that these were the work of men who at the commencement of their training in the Association's Schools showed no greater ability than the average student, and counselled the present students to take courage from this fact, and to realise that success would only come through persistent work.

He welcomed the new third-year course because he had always felt that the time spent in training an architectural student was inadequate, and he pointed out that, in comparison with other professions, the usual period for study was extremely short. He hoped that before many years it would be considerably extended, and indeed this would be essential if we were to keep pace with other nations.

List of Awards and Prizes.

The awards announced by the President were as follows:—

DAY SCHOOL.

First Year.

Book Prize for first place in History Text paper and general excellence in this subject—*M. T. Waterhouse.*

Book Prize for first place in Construction Text paper and general excellence in this subject—*A. S. Furner.*

Architectural Association Sketch Book for first place in Freehand Drawing—*A. S. Furner.*

The Studio Prize: Best portfolio of drawings made during Session—*A. S. Furner, M. T. Waterhouse (equal).*

Hon. mention and authors of drawings selected for School portfolio—*M. H. C. Doll, C. J. Brooks, W. A. Forbes, H. F. Goslings, J. Burford.*

Second Year.

Travelling Studentship 15*l.*, for studio and lecture work during Session, 1911-12, and general progress—*H. J. H. Dicksee.*

Specially commended, and Special Prize given by Headmaster—*H. G. Satchell.*

Hon. mention for general progress during Session—*R. S. Wallace, E. C. Davies, J. S. Hodges, W. W. Locke.*

End of Session Test.

Subject: "A Study for a Market Hall." Award and Prize given by Mr. Gerald C. Horsley, President Architectural Association. Study placed first, *E. C. Davies*; study placed second, *R. S. Wallace*; study placed third, *H. J. H. Dicksee.*

Drawings selected for presentation to School portfolio—*H. J. H. Dicksee, E. C. Davies, H. G. Satchell, R. S. Wallace, W. W. Locke.*

Students recommended for the Association Two Years' Course Certificate—*E. C. Davies, H. J. H. Dicksee, J. S. Hodges, H. G. Satchell, H. G. Tebbutt, R. S. Wallace, W. W. Locke.*

EVENING SCHOOL.

First Year.—Book Prize, value 2l. 2s. H. A. N. Medd; Second Prize, value 1l. 6d. F. W. Mackenzie; hon. mention, H. S. Davis.

Second Year.—Scholarship, free pass to Third Year, value 15l. 15s., J. B. M. Walsh; Book Prize, value 2l. 2s., E. K. Smith; hon. mention, A. J. Thompson.

Third Year.—First Prize, Scholarship value 15l. 15s. divided between D. J. Gordon, T. W. Dowsett; hon. mention, H. F. Prynn, H. D. Archer.

Fourth Year.—Travelling Studentship, value 15l., A. T. Hardman; Book Prize, value 2l. 2s., T. F. Ford; hon. mention, T. F. H. White, F. P. Spooner, D. W. Stuart.

EXHIBITION OF DRAWINGS BY PAST AND PRESENT STUDENTS.

It was a happy idea of the Association to combine drawings by past students in its annual exhibition of the work done in its schools. The critic has the opportunity of a lucid review of the general tendencies of the teaching; on the first floor he may see with large what is in embryo on the top floor. This at least in theory; in practice the exhibition suffers both from want of space and a certain lack of generosity in the arrangement. Want of space drives the work of the first-year students up to the attics, where perhaps few save fond parents will adventure—to find the drawings of some half-dozen representative students pinned a little casually round the walls. More might have been done to make this work tell, by giving each student's work a large strainer to itself, by labelling it definitely, by adding a short printed explanation of the methods of teaching in the first year, which would give the critic an opportunity of seeing what the student was at—whether the measured studies are from actual buildings or from plates, what liberty is allowed in the choice of what he will measure and sketch. In studies of village club and almshouse, of woodwork from South Kensington, of the Orders, of working drawings for a small house, there is a pleasant, if somewhat timid, earnestness. Both for future use and for the immediate development of scholarly precision all studies from museums or from plates should be annotated in the fullest possible way by the student, with date and catalogue number, and everything else which makes for clearness. This is particularly the case with the Orders. The novice is brought up abruptly here against something which has for him at once the unreality of a diagram and the inevitability of the Athanasian creed. He should be encouraged to work out for himself the pedigree of the Orders, whose proportions were in his own day disregarded, and fathered for the modern world by the architects of the Renaissance who were unblushingly inaccurate when it suited their purposes. This should lead him to investigate for himself, in museums or in the archeological drawings of Prie de Rome students, the many modifications of Greek and of Roman Orders; and if he annotates his sketches and notes freely and fully he may at last come to feel them as something interesting and perhaps alive. Those whose chief impression of the Architectural Association is of a building, sombrely apparelled in casts would expect to find among the work of the first year more fine freehand drawings of ornament in charcoal, pencil, or pen.

The work of the second-year students and of

the evening school is shown to better advantage round the walls of the upper gallery. In the second year are pleasant designs for stone almshouses, for village churches, half-timber work, gateways to Greek maritime towns, and a thorough measured study of S. Kenelm, Minster Lovell. There is a lack of freehand work. Much of it is pleasing, none of it arresting. The charm of homeliness is the last quality of an experienced master. Ought not the student in his second year to be given rein a little more, to have some big colour-scheme to do a great bridge, a cathedral tower? "Shades of the prison-house begin to close": the sound of the telephone is already in his ear. Before the office claims his day there is the opportunity to exercise his imagination in big design.

For it is perhaps this same quality of imagination that seems a little lacking in the well-drawn and thorough work of the evening school, in the designs for a school chapel, a Georgian house, a garden tea-pavilion. A tea-pavilion may reasonably be fanciful—Italian, delicately Greek, even Egyptian; it depends on the character of the garden. But to make it monumental is to lack fitness; to make it face the four winds of Heaven is impractical. A school chapel, again, the centre of an intense, if shifting, life, the focus of many aspirations, a sudden memory in Canadian wheatfield or Rhodesian scrub, is capable of highly imaginative treatment. There is a little want of spaciousness and joy about the designs. Some are cramped at the east end, many have a middle passage only 6 ft. wide; these have met the material needs, accommodation and cheapness, rather than the spiritual, the creation of a building that shall worthily be the centre of the vivid life of a public school. Many of the drawings are interesting and good, and the combination of working-drawing and stress-diagram is one of the strongest features of the advanced work at the Association. The introduction of an usher in cap and gown, and presumably 6 ft. high, on a drawing cannot be held to do away altogether with the need for a scale. This is, indeed, a noticeable want in many cases.

It is not altogether clear upon what lines the drawings of past students have been arranged. The exhibition is, it may be, characteristic of the versatility of the Association teaching. In any case, it is well worth going to see. There are Royal Institute of British Architects' prize drawings and photographs of cottages at Olden Park, working drawings of camp buildings and mausoleums from Paris, water-colours, and pencil sketches and competition designs from Marblebone and the Port of London. In an exhibition of the kind more might have been made of the chance of combining working drawings with photographs of finished work. As it is, it is all a little haphazard. Many of the best drawings have been seen before. Mr. Maxwell gives us a valuable summary of the facts rather than the charm of Compton Wynnyates. Mr. Robinson's preliminary studies for the Soane Gateway are worth seeing. His finished design is perhaps overburdened with the multiplicity of earlier ideas. There is much else in the way of excellent drawing and design by those who have lately left the Architectural Association. The complete stress-diagrams of Mr. Hepworth's frontier custom-house would have been a valuable complement to his effective water-colour. A key sketch or a picture-postcard is wanted as a guide to the elaborate, perhaps harsh, set of drawings of the Queen Mary block

at Greenwich. There are many ways to see in the lecture-room. On the exhibition is of considerable wealth; a little invertebrate.

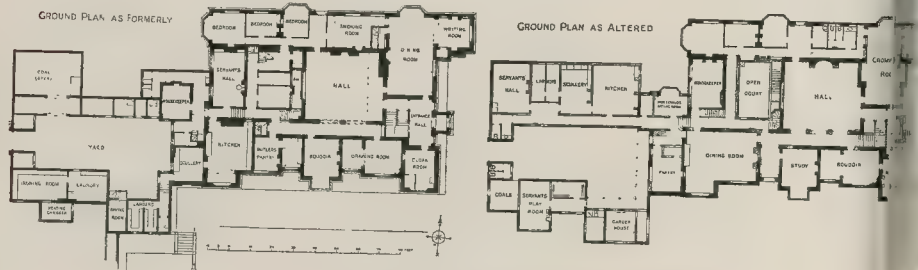

The exhibition will remain open Tuesday, the 30th inst.

THE ARCHITECTURAL ASSOCIATION.

CHEQUERS COURT, Buckinghamshire, the objective of the last summer Session on July 20, and was reached from Princes Risborough Station, halting en route for a brief inspection of the borough Church, finely placed on top of a hill.

Chequers Court, a fine brick and stone of the style of Moyns Park, has a most interesting history of remarkable both historical and architectural. Lee, M.P., who most kindly re-entertained the party, fully appreciated the quality of the house, and obvious the fascinating task in which he is that of winning back something of form and spirit. The earliest part of structure dates from about 1490, but the house belongs to the second XVIIth century, for about 1665 William remodelled it, leaving the house with the open side facing south; he characteristic bays, and entirely in it. About 1630 the courtyard in by a new range of buildings to and subsequently considerable damage culminating when the splendid brick stuccoed over, and sham battlements wholesale.* All trace of form and gardens had been obliterated early century. Mr. Lee, acting on the Mr. Reginald Blomfield, A.R.A., we are indebted for the plans herewith, has changed all this. has been replanned, the windows new plaster ceilings modelled examples from contemporary have been formed, panelling has been doorways opened out, the fine stables from obscuring additions, and in the house has been restored to condition. Considerable alterations interior have been made, and an office wing built from Mr. Blomfield. The house lacked an adequate entrance porch with bay above has been added east front. An area has been enlarged internal court, and the whole of the house has been reconstructed from the Blomfield. The kitchen and its outbuildings inconveniently occupied an obtrusive on the south front, have been removed one-story wing at the south-west, present the north front is the only satisfying as regards its setting. The so of lofty wall, topped by five parallel simply divided into three stories, string courses level with the windows its two stories of simple four-transomed windows alternating with below the range of smaller windows, all this rising from a level stretch of with flag-paved pathway, gives a pleasurable impression of structural naturalness and its resultant beauty.

* The stucco was removed on the Reginald Blomfield, A.R.A., some fifteen

Proposed Bandstand, St. Leonards-on-Sea: First Premiated Design. By Mr. Philip Tree, F.R.I.B.A.

BANDSTAND, ST. LEONARDS-ON-SEA.

competition for a sunk arena and band-stand at the lower Warrior-square Gardens, St. Leonards-on-Sea, was decided in June, 1911, Mr. W. Wills, A.R.I.B.A., of London, being successful. The first premium, as already mentioned, was awarded to Mr. Philip Tree, A.R.I.B.A., of St. Leonards-on-Sea, and 63,

Queen Victoria-street, and the second to Mr. C. G. Boucher, A.R.I.B.A. Both designs are illustrated in this issue.

Twenty-three designs were sent in, and Mr. Wills considered that Mr. Tree's design submitted under the *nom de plume* of "Practical," was "a very carefully-thought-out scheme of considerable architectural merit, and the nearest approach to a solution of the problem."

Mr. Tree writes:—"The general lay-out provides for the adequate accommodation of a

large body of people, completely sheltered from the prevailing south-west winds and inclement weather, with the seating of the arena so arranged that the audience shall not face the sun. The bandstand, it should be noted, is placed on the northern side, and not in the centre, as is so often the case. The levels have been managed by a series of slopes, so that there are no steps to descend to the shelter, colonnades, or enclosure. This renders it easily accessible to invalid chairs. Provision is made for the

country structure, its chief claim to
consisting of some fine wall-paintings
uting the Saviour with the twelve
s. These were only discovered a few
ago beneath the whitewash, during the
t cleaning.

Victoria and Albert Museum.
e Parliamentary papers Mr. Grant asks
estions of the President of the Board of
ion, viz.—(1) Whether, besides placing
signs for various materials in proximity
objects of cognate material in the
s of the Victoria and Albert Museum, he
ow cause the remaining portion not so
o be transferred to the departmental
rooms; and (2) whether, in considering
posal of the casts in the Victoria and

Albert Museum, the desirability of placing a
selection of them in the South Court of the
Museum amongst corresponding original works
will be kept in view.

Mr. J. Pease answers the first question in the
negative, and with regard to the second says
that the South Court of the Museum is devoted
to the collections of the department of metal-
work; and, in the consideration of the questions
regarding the disposal of casts, to which
reference was made in the answer given to Mr.

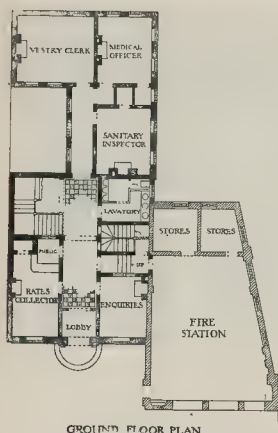

Grant on July 5, no alteration in the arrange-
ment of those collections is at present involved.

Gillingham (Dorset) Post-Office.

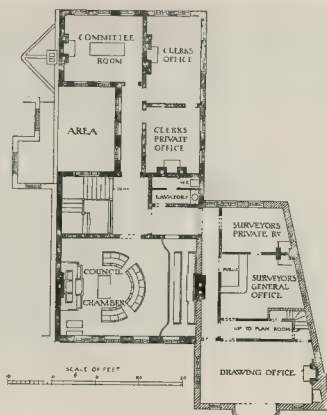

In Friday's Parliamentary papers Sir R.
Baker calls attention to the delay in the building
of the new post-office at Gillingham, Dorset, the
plans for which, he says, have been approved of
for twelve months and the tenders accepted by
the owner of the site for nearly six months.
The Postmaster-General, in reply, admits the

delay, which he says is due to difficulties in connexion with the site, the high cost of the building, and modifications of the terms required by the lessor. It is hoped that building operations will be put in hand at an early date.

Warmington Church.

In memory of the fifth Earl of Carysfort, who restored the church in 1870, a new bell has been dedicated in Warmington Church, Northants, by the Countess of Carysfort. The structure, which is dedicated to St. Mary, is both beautiful and interesting. Throughout, the architecture is Early English, with the original nave roof groined in wood. The western tower is fine, but the chief feature is the nave of five bays, with its wooden groining starting from stone springers. The ribs of the nave spring from small shafts terminating in beautiful capitals of foliage, supported on corbels and representing priests and bishops. The adoption of the wooden groining instead of stone was probably brought about by the seeming weakness of the walls. From before the Conquest Warmington belonged to the "abbott and convent" of Peterborough, and so it continued until the dissolution by Henry VIII.

COMPETITION NEWS.

A list of current Competitions is printed on page 125.

New Baths for King's Heath.

The Baths Committee of the Birmingham Corporation met on the 19th inst. at the Council House. The award of the Assessor, Mr. A. N. Bromley, of Nottingham, in regard to the plans for the projected baths at King's Heath was received. His decision places Messrs. Crouch, Buller, & Savage, of Newhall-street, Birmingham, first, and the premiums go to Messrs. S. N. Cooke & W. N. Twist, Colmore-row, and Messrs. Round & Weaver, Newhall-street.

The Alhambra Theatre, London.

After a limited competition, Mr. Bertie Crewe has been appointed to carry out extensive alterations and additions to the Alhambra Theatre, Leicester-square. Part of the work will consist in cutting out the pit and carrying back the stalls on a suitable slope. At the back will be a parterre on the Continental system.

Huddersfield, Town Planning Scheme.

Liberal premiums are offered by the Huddersfield Corporation for designs showing how certain areas in the borough could be laid out advantageously. So far as we know, however, no architect has been appointed as assessor, and if this point is not settled competitors of experience will not enter. An announcement on the subject from the Corporation will be welcome.

New Municipal Building, Rangoon.

The conditions of this competition contain no mention of the appointment of a professional architect to advise in the selection of the best design. This is unfortunate, and the Committee

of the Municipality should take steps at once to remedy the omission. It is curious that this point should have been overlooked, for Clause 5 stipulates that if the successful competitor appoints a local architect to supervise the execution of the work such a representative shall be a member of the Royal Institute of British Architects. Only six architects connected with the Royal Institute seem to have offices in Rangoon, viz.—Mr. Ballardie, Mr. T. S. Gregson, Mr. Morris, Mr. E. J. Pullar, Mr. de Souza, Mr. Swales. Questions must be sent before September 21 to Mr. Launcelot P. Marshall, M.Inst.C.E., Chief Engineer, Rangoon Municipality, and designs must reach Rangoon by January 1, 1913. The selected design and the two premiated ones will be retained by the Committee, but all others will be returned to their authors, carriage paid. It is considered desirable that no tower or domes should be included in the design.

Public Offices, Harrow-on-the-Hill.

The accompanying design, by Mr. H. Prince, A.R.I.B.A., was placed first in the recent competition at Harrow. The existing offices and fire-station are to be incorporated in the new buildings and the existing rooms adapted to suit new requirements.

A Council-chamber is included in the new scheme (31 by 22), and other rooms are to be provided for rates, sanitary and medical officers, Committee, clerk, vestry clerk, and surveyor. Caretaker's quarters are also included.

The external walls are to be faced with 2-in. grey facing bricks, the jambs and arches to window-openings to be constructed with red-facing bricks. The roofs are to be covered with tiles.

The cornice is to be in Portland stone, as also the jambs and entrances on main front.

The floors throughout to be of reinforced concrete. It is intended to panel the walls of Council-chamber and Committee-room with English oak. The building is to cost 4,700.

Mr. William Flockhart, F.R.I.B.A., was the assessor in the competition.

Australian Capital City.

In addition to the awards to Mr. W. B. Griffin, of Chicago, and to the other competitors, Honourable Mention was made in regard to the design of Messrs. Schaufelberg, Rees, & W. H. Gummer, A.R.I.B.A.

CORRESPONDENCE.

The R.I.B.A. and the National Insurance Act.—I have read with great interest E. J. Dixon's letter in your issue of inst., in reference to the above, and hope that the Royal Institute will consider the proposal and endeavour to administer the Act and safe interests of those architects and their who will be affected by the working of the Act. It is a very welcome addition to the Statute which has been forced upon us so late.

CYRIL E.

CEREMONIAL KEY.

THE silver-gilt and steel ceremonial key reproduced herewith was presented to architects, Messrs. Ashley & Winton Neave, on the occasion of the opening of the new extension of the Birmingham Art Gallery and Museum.

The key represents the Birmingham arms, and on the reverse side is the name of Mrs. Feeney in silver, richly chased. The shaft is in bright steel. The key was designed and made for the architect, Birmingham Guild, Ltd., 45, Great Street, Birmingham.

Ceremonial Key used in Opening of Birmingham Art Gallery.

ILLUSTRATIONS.

Port of London Offices.

Week we referred at length to the important competition which culminated in the award of the first place to Mr. T. Edwin Cooper, F.R.I.B.A., and we have illustrated Messrs. Lanchester & Rickards have given us the

opportunity to reproduce their design, one of the six in the final competition, and we cannot do better than to quote from our article on the subject last week:—

"Messrs. Lanchester & Rickards submit a scheme which is finely conceived and well carried out. The lay-out is fan-shaped, with the short side to Trinity-square, the radiating sides fronting on Savage-gardens, and a new street to be formed roughly parallel to Byward-

street. The back part of the building forms a long and well-designed curving front.

Internally a broad hall runs from back to front, broken by an elliptical feature, the centre of which intersects with a curved top-lighted hall, which forms the public space of the Port Rates, Chief Collector's, Charges, Chief Superintendent's, Canvassing, and four smaller departments. Unfortunately, such a plan necessitates a large number of irregularly-shaped

Elevation to "St. Catherine's Court"

rooms, which, however, may be considered of smaller importance in this than it would be in many buildings, as the requirements are largely utilitarian.

The treatment of the remainder of the site is skilful, a large area being left in rear of the new offices. Architecturally the scheme is both simple and pleasing, free from ostentation,

and very sober and dignified. A range of pilasters runs round the entire block emphasising the ground and first floors, surmounted by a simple stone attic story above which is a stone balustrade and mansard roof with dormers. The central feature is worked up very happily, and its receding stages are skilfully proportioned and well designed. There is a unity and har-

mony about the whole design which is characteristic of the work of Messrs. Lanchester & Rickards, among whose best efforts it will

Regent's Quadrant Competition.

It is competition, instituted by the proprietors of the *Builder*, was described

In the purposely steep pitched roof over, large dormer windows are provided which would amply light the showrooms behind.

Port of London Offices: Design by Messrs. Lanchester & Rickards, F.R.I.B.A.

To preserve a unity or harmony between the two structures, the same width between the columns in Mr. Norman Shaw's design is maintained in the new design; but instead of filling this up with heavy masonry a light metal treatment has been adopted, thereby obtaining the maximum of light for each floor.

Then by using single columns attached to riars the unnecessarily heavy cornice can be dispensed with.

To prevent a disagreeable gap between the two buildings it was found necessary to connect them by introducing some of the features of the one to the other and by a deeply recessed arch with solid attic over, having sculptured figures in the spandrels.

Provision has been made for the most up-to-date method of lighting shop-windows. The shop itself would be lit directly from the upper portion of the window glazed with prismatic glass. Within the window-cases provision is made for diffused artificial downward lighting, which is found to be the most agreeable method of lighting of goods. The sun-blinds would be attached to the top of these cases, and therefore would not interfere with the lighting of the shop when the blinds were in use. Where this is not observed it is generally found that the shop is considerably darkened, which greatly detracts from the proper display of the goods in the daytime.

A magnificent tea-garden could be introduced on the roof overlooking Piccadilly and the Mall, consisting of a light wooden pergola encircling the tea-garden, which would be sunk about 3 ft. below the level of the floor of the pergola, and would form a valuable attraction to the stores in the summer for customers.

The sculptured figures over the columns would be designed to depict the most refined costumes of the present day."

MEETINGS.

TUESDAY, JULY 23, to WEDNESDAY, JULY 21.

BOOKS.

Rambles in the Pyrenees and the Adjacent Districts, Gascony, Pays de Foix, and Roussillon. By F. HAMILTON JACKSON, R.B.A. (London: John Murray. 21s. net.)

This book follows on lines similar to those of the author's work on "The Shores of the

Adriatic," in so far as the places visited follow upon a continuous thread. The author has passed by those parts of the district well known to English people, and has devoted attention to places which are more or less fresh to the traveller; moreover, with the object of keeping the volume to a convenient size, he has limited the scope of the work to the French side of the Pyrenees. As on this side are many interesting and historical buildings, we are not surprised that Mr. Jackson has produced an entertaining book in describing the cathedrals, churches, castles, ruins, etc., in the districts covered by his rambles. He is not altogether concerned with architectural art in the course of his wanderings, though he has an evident love for it; but his gossip narrative includes notes, not only on the principal buildings but on the scenery, and such everyday events as a marriage, a funeral, and the hundred and one little adventures met with by the traveller in foreign lands. The author has much to tell, and he succeeds in interesting the reader in telling it—probably because he was interested himself and knew what to write about. A portion of the matter contained in the volume has previously appeared in our columns, but it has been revised, and, to a large extent, rewritten. Included in the work are some good illustrations from photographs by Mr. J. C. Ashton, while the author himself gives a number of his own effective sketches and drawings.

Municipal Art Galleries and Art Museums, their Scope and Value. By BERNARD DOUGLAS TAYLOR. (Manchester: J. E. Cornish, Ltd. Price 6d. net.)

ALTHOUGH the direct objective of this pamphlet is the Manchester Art Galleries, it bears also upon the conditions and development of art galleries in general. The value of provincial museums is at present greatly underestimated. The resources of local interests, historical and industrial, demand a more intelligent investigation than they now enjoy. And the first step toward this is set forth in the following utterance of Sir W. W. Flower, which the author quotes:—"What a museum really depends upon for its success and usefulness is not its building, nor its cases, nor even its specimens, but its curator." A curator of the first order will discover and co-ordinate material. He will create unexpected interests from the slenderest resources.

There need be no township traditionally too poor to own its museum. Local topography, as recorded in forgotten sketches and prints, has not been half exploited. The fame which a locality once boasted in some manufacture or production lies still buried in the ages. Then, the temporary exchange of exhibits with other galleries is full of possibilities. Unfortunately, notwithstanding the capabilities of curator or director, he more often than not is but an official cipher, the whole direction being in the hands of

a governing body. Mr. D. S. Macdonald, in a recent article in the *Nineteenth Century* has pointed out this situation.

The construction of galleries is too important a matter to be left to the whims of the Art Galleries of Birmingham and Manchester. This branch of the matter was well discussed by Mr. Edwin T. Hall in a paper read before the R.I.B.A. on April 1 last. Of the height of the cabinet, greater or less height, side lighting, are the chief controversial points.

Both gallery and cabinet have found their plan of the recent additions to the Manchester Art Gallery. It is found that the latter is easily supervised. If the improved method of hanging pictures only upon the line is adopted, a lofty gallery leaves a most undesirable feature that appears to swallow up the exhibit. Architecturally, height may be a factor.

Top lighting is almost invariably employed, yet the particular form this shall take is not agreed upon. It may easily be overdone, an awkward angle of light introduced, and in some instances been found necessary to suspend glass screens or velaria between the lights. We are inclined to think that the difficulties of lighting are largely due to the fact that no two pictures demand the same conditions.

FIFTY YEARS AGO.

From the *Builder* of July 26, 1850.

Hampstead Heath.

EACH session of Parliament, notwithstanding the discouragement which the Government has received, renewed attempts are made to alter the title of the manor to obtain permission to build upon this open and picturesque ground; which is every month, as the police extends in this direction, becoming of greater value to the pent-up London. Not many years will have passed, if it be continued to the same extent as at present, before the Heath will be joined to North London by houses and surrounding all sides by dwellings; then the value of the land would be greater than just now conceive. . . . It therefore is an important matter for serious consideration how arrangements can be best made to secure this land for the public use.

* * In 1866, Sir Thomas Wilson, a pleader at all the cognomies, and that the Heath was now his property, began to build a house on the Heath. Upon this a strong opposition of Hampstead residents was formed. Large sums were subscribed for the purpose of trying the case in the Law Court. The proceedings dragged on for years, and issue seemed open to doubt. Sir Wilson died and was succeeded by his brother, who was open to compromise. Eventually the manorial rights on the Heath (with certain small exceptions) were transferred in 1871 by the Metropolitan Board of Works (now the London County Council).

In 1899, the Heath was more than doubled in extent by the purchase from the Mansfield and Sir Spencer Mayson respectively, of Parliament Fields at Park, containing together about 260 acres. Ten years later the beautiful estate of Hill at North End was bought by the executors of Sir Spencer Wells, the surgeon, and thrown open as a public park. Further, in 1907, some 100 acres were added at the northern end of the Heath, purchased of the picturesque field known as "Collins' Fields," then christened and more generally known as "Wylde's Farm," the old and euphonious name which has been adopted. Adjoining this last purchase is the New Garden Suburb, which, covering a large area already, is still in the process of erection. This, in brief, is the situation recorded in the paper above quoted, and for most of our information we are indebted to Mr. Mayle of the Priory Press, Hampstead.—Ed.

MONTHLY REVIEW . of . ENGINEERING.

FORCED CONCRETE
PRINTING WORKS :S. R. CLAY & SONS, LTD.,
BLACKFRIARS.

the most important examples of reinforced concrete construction in London recently been completed from the Mr. G. F. Collinson, F.R.I.B.A., at street, Blackfriars, for the printing Mr. R. Clay & Sons, Ltd.

richly feature of the building is that walls, as well as the skeleton frame, reinforced concrete, which, in consequence, exhibited as an architectural material, merely employed in structural forms by brick or stone.

shows with sufficient clearness that, so far as is concerned, the material lends itself to effective treatment, even though the use of concrete may not be all that is desired.

itect of this building is certainly gratified on a successful attempt to design expressing the material and construction, although it must be that in some details the idea of cut stone is too strongly expressed for reliance with ideal reinforced concrete.

whole, however, the composition is good, and represents a great improvement on the dreary type of brick factory which is far too common in London cities. In addition to the pleasing obtained by the adaptation of towers and, the exterior is lightened by an large proportion of window surface, the general effect and the utility of

g. Alexander Drew, M.I.Mech.E., acted as engineer for the reinforced concrete work, designed in accordance with the plan, and executed by Messrs. D. G. & Co., Ltd., of Westminster.

ilding has a frontage of about 260 ft. on Fenchurch-street, measuring 96 ft. deep at the end and 41 ft. deep at the south end. It covers about 16,000 sq. ft., and the contents of the building is a little more than 900 cubic ft.

time when the plans were authorised by London County Council were unable to effect any reduction in the thickness of the exterior and interior walls, all of which are, in fact, of the same thickness as ordinary brick walls.

necessary amount and dead weight of the building thereby entailed added considerably to the cost of the work, encroached upon the floor space, and threw a great deal of additional load upon the foundations, all of which are compensated by advantages.

Building includes basement, ground floor, second floor, terrace roof with three large towers. In the basement are the boiler house, coal and gas stores, engineers' and carpenters' shops, and gas apparatus room, printing-room, paper, type, and plate store-rooms, and space for additional printing machines, and ventilating chamber, and two lift shafts.

The ground floor, as shown by the plan in Fig. 2, is the main printing room, occupying nearly the whole of the floor. A covered courtyard for vans is at the south end, three main staircases and convenient means of communication between the ground floor and the first floor, in addition to a small proof lift for the reviser.

The first floor are rooms for cutting and a large warehouse, book store, and tea-rooms.

The second floor are the general and private reading-room, luncheon-room, compositors' and proofers' room, and lead-casting-room.

The terrace roof provides a floor for a men's room, kitchen, scullery, and domestic offices, contained in a house occupying a position on both sides of the central staircase, the latter being a tank-room. The end

towers bring the stairways up to roof level, and covered ways are constructed to connect the stair landings with the roof house containing the dining-room and kitchen. Fig. 3 is a longitudinal section, and Fig. 4 includes three transverse sections through the building on the lines indicated in Fig. 2.

Reference to Fig. 2 will enable the reader to identify the positions of the column footings, which vary in dimensions with the loads to be carried, and in some cases where the columns are near together one footing supports two or more columns.

In order to ensure perfect stability the footings were taken down to a firm bed of gravel at the average depth of 19 ft. below street level.

The footings are proportioned so that the maximum pressure on the ground does not exceed 2 tons per square foot. Along the front of the building the column footings are from 10 ft. to 11 ft. square, and consist of a tapered slab from 14 in. to 26 in. thick, reinforced by 1-in. Kahn rib bars in two series at right angles to one another.

The exterior columns in the front of the building are spaced about 20 ft. apart, centre to centre, and are nearly square in cross-section up to the upper part of the basement, where they are widened out and continued to first floor level in the form of twin columns side by side, and above the first floor in the form of piers.

Fig. 1. Principal Facade.

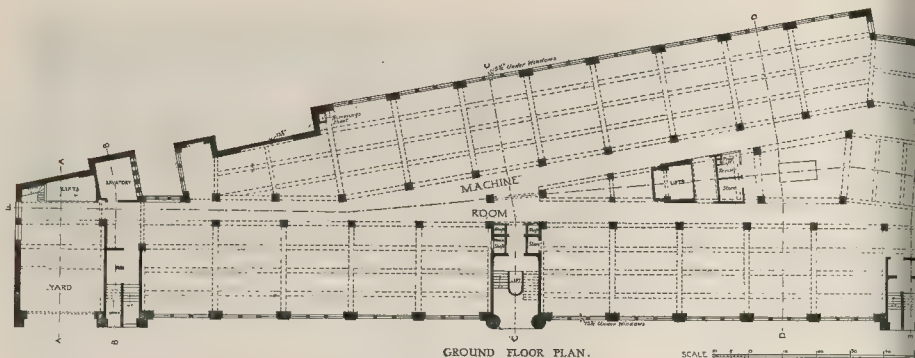

Fig. 2. Plan of Ground Floor.

The columns are reinforced by longitudinal $\frac{1}{2}$ -in. rib bars, and $\frac{1}{2}$ -in. bars in spiral coils of 2-in. pitch, as transverse reinforcement. The piers in continuation are reinforced by vertical and horizontal rib bars constituting a network of steel with meshes about 9 in. square.

The interior columns are reinforced by longitudinal bars and spiral hooping, as described above, and are progressively reduced in cross-sectional area from floor to floor proportionately with the diminution of load to be carried.

the façade are reinforced by $\frac{1}{2}$ -in. and $\frac{3}{4}$ -in. rib bars, and the parapet to the terrace roof is designed as a reinforced concrete beam. Fig. 5 is a detail of the main cornice from one of the architect's drawings.

The design of the exterior walls is quite novel in several respects, and was evidently intended to overcome as far as possible the disadvantages imposed by the unnecessary wall thicknesses demanded by the building regulations in force at the time.

the building. The average span of the beams is 26 ft., and of the secondary 20 ft., the connecting slab averaging thick, $1\frac{1}{2}$ in. of this being granolithic each bay immediately after completion of reinforced concrete work.

The beams are reinforced by Kahn bars, and the slabs by rib bars in two directions. Fig. 6 is a view on the ground floor of the interior columns and the under side of the main and secondary beams and slabs.

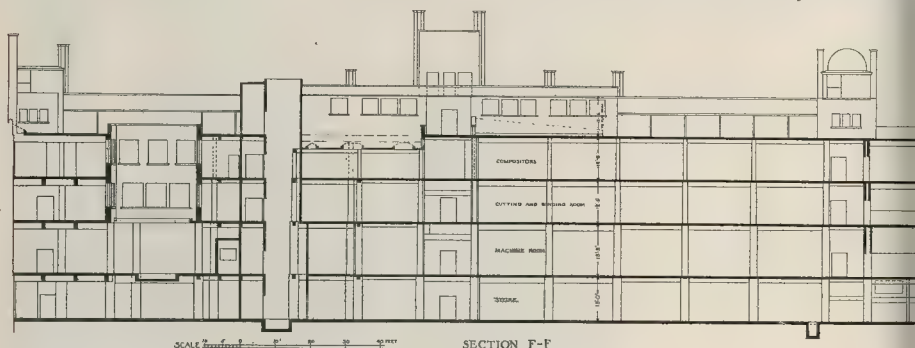

Fig. 3. Longitudinal Section.

Ample provision for the admittance of light has been made by windows to the full width of the panels between the twin columns in the ground-floor story and between the piers in the stories above. The windows are divided by reinforced concrete mullions, and wall beams or lintels are constructed at each floor level to take part of the floor load, while the wall panels above the windows are also constructed to act as beams.

The main cornice and projecting features on

The floor loads are exceptionally heavy, consisting of heavy printing and auxiliary machinery at various points on the ground, first, and second floors, in addition to the estimated uniform load of 3 cwt. per square foot throughout. The first floor and ground floor have also to carry electric runways each involving the travelling load of 1 ton.

Fig. 2 shows the arrangement of the main and secondary beams in the ground floor, which may be taken as typical of the other floors in

first floor. Some temporary struts are seen in position beneath the beams as a guard during the hardening of the concrete.

All stairways, staircases, and lifts are constructed in reinforced concrete, a universal employment of which in the building is a valuable feature from the standpoint of fire protection.

Another advantage secured by the use of monolithic reinforced concrete construction is an almost entire absence of vibration

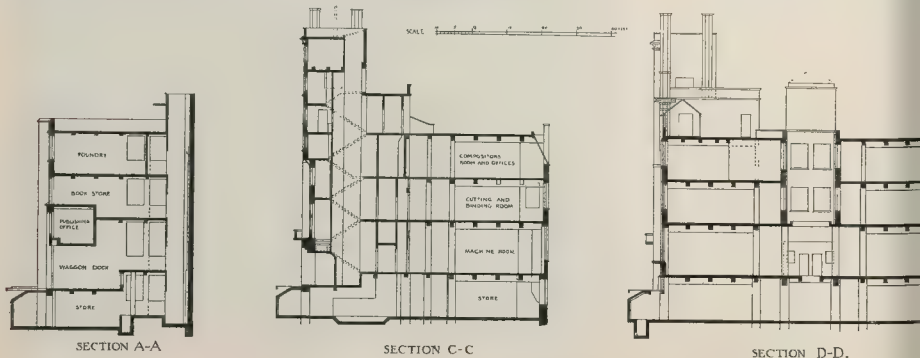

Fig. 4. Typical Cross-Sections.

and other machines are in operation. The new building compares with the works previously occupied. That building was of brick with work, and it is stated that the was so great that on the top floor the structure was quite perceptible. The contractors' plant included two electric concrete mixers, one at each end. Concrete from these was delivered by high-speed hoisting skips, of raising a load of 2 tons. The skips their contents into storage hoppers, feeding side-tipping trucks, in concrete was conveyed to different required.

and steel for reinforcement were by an auxiliary hoist fixed in one of the.

Asessment were established temporary for bending and shaping the steel for preparing the moulds, centring, and so on. A 36-in. diameter circular by electricity was installed in the shop.

For concrete mixing was obtained from the by the contractors on the site. The materials for the concrete were delivered and shot direct into storage hoppers, so as to deliver accurately-measured of cement, sand, and ballast into the the correct proportion of water for of concrete was admitted from measuring tanks.

to the care bestowed on the on-plant installation the concrete was very efficiently and economically, work of erecting the building was generally.

ment for the concrete was supplied by Martin Earle & Co., Ltd., the sand and Thames sand, sharp and gritty, aggregate consisted of washed Thames washed to pass through a 1-in. square carefully graded in size. The size of the magnitude of the reinforced construction may be gathered from ment that it involved the use of 500 steel, 1,500 tons of Portland cement, of sand, and 6,000 tons of Thames

CENTRAL HEATING AT MANCHESTER UNIVERSITY.

COLLEGE, now forming the oldest in the University of Manchester, was Oxford-road from 1873 to 1877. Since any new buildings have been added, the original site, bounded at the sides and street and Burlington-street and upon land beyond.

Fig. 6. Interior of Ground Floor Story.

The original building and successive additions were provided with independent heating installations, each with its own boiler-house or heating-chamber.

Various systems of heating were adopted from time to time, some of the buildings being warmed by low-pressure hot-water circulating in pipes and radiators, some by low-pressure steam, also in pipes and radiators, and some by hot air distributed through ducts.

The different methods of heating and the different sizes of the installations finally resulted in a heterogeneous collection of boilers and stoves, including Cornish, Lancashire, and vertical steam boilers, saddle and sectional hot-water boilers, and several hot-air stoves.

The large number of fires to be maintained in the various buildings and the antiquated arrangements for stoking and handling fuel and ashes combined to render the equipment both wasteful and troublesome.

With the object of placing matters on a more satisfactory basis—a central heating station has been built and equipped in the western quadrangle. From this station heat

is supplied to all the University buildings, although it has been found impracticable to make any change in the methods of warming.

We give on the next page a plan of the University buildings, and illustrating the general arrangement of the remodelled heating installations.

The heating station comprises a boiler-house and an engine-room, the floor being 9 ft. below ground level. In the boiler-house three Lancashire type boilers, each 28 ft. long by 7 ft. 6 in. in diameter, provide steam for heating water as required in the pipes and radiators of some buildings, for heating air to be distributed through ducts in other buildings, and for use, after reduction of pressure, in the pipes and radiators of other buildings again. The boilers also supply steam to the electricity generating plant and for other requirements throughout the University.

Coal bunkers have been constructed in front of the boilers so that fuel can be delivered into them from waggons, and a refuse destructor for burning rubbish has been placed in one corner of the boiler-house.

The engine-room is equipped with electricity generating plant, pumps for boiler feeding and for the circulation of water and steam in the heating installations, live and exhaust steam calorifiers, fans for induced draught, warming and ventilation, and various auxiliary appliances and fittings.

Thus it will be seen that, although the original methods of warming are essentially unaltered, the whole of the heat is generated at one central point, thereby obviating the waste of fuel and labour previously occurring, and at the same time providing facilities for the more efficient control of the warming systems.

Three vertical calorifiers in the engine-room provide water for the buildings warmed by low-pressure hot water. One calorifier is connected with the exhaust pipes for the engines and steam-driven pumps, and has alternative live-steam connections. The other calorifiers are supplied with live steam only.

Hot water is circulated through all the buildings so warmed by the aid of two circulating pumps of the "Roturbo" type, the total radiating surface in the buildings being 34,800 sq. ft.

Those departments warmed by steam are supplied direct from the boilers, the pressure being suitably reduced by means of reducing valves. The total radiating surface in the buildings warmed by steam is about 3,000 sq. ft., and all water of condensation is conveyed back to the boiler-house.

Whitworth Hall and the Christie Library are warmed by hot air. The old stoves, which had an inconvenient habit of discharging sulphurous fumes and other objectionable products into the ducts, have been replaced by steam batteries with the heating surface

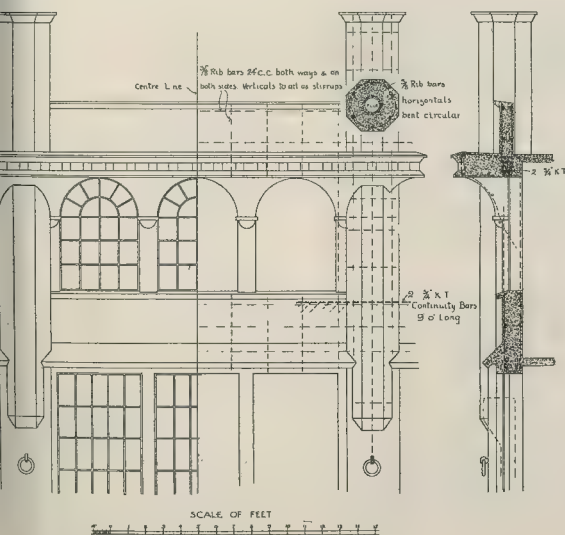

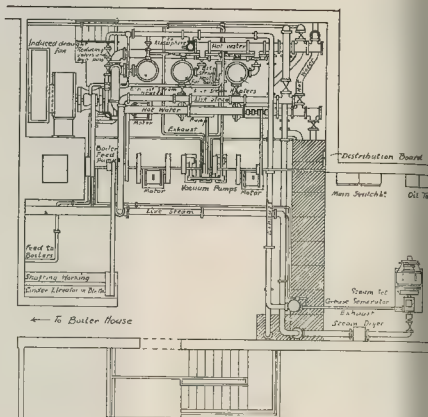

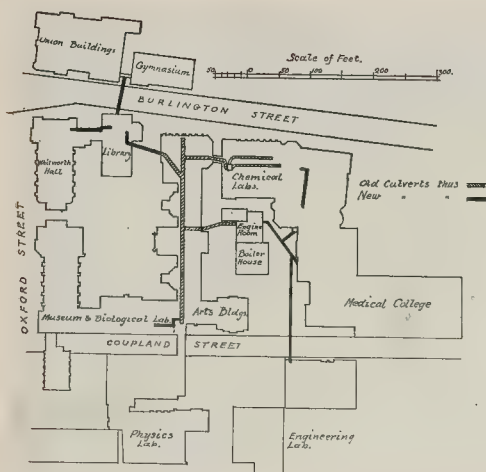

Fig. 5. Detail of Reinforcement at Main Cornice.

Central Heating at Manchester University.

of 514 sq. ft. The air passed over these is filtered and washed and distributed by means of an electrically-driven blowing fan. The total contents of the two buildings is equal to 408,500 cub. ft. For the purpose of a rough comparison we may state that if they were warmed by hot-water radiators on the basis of 10 sq. ft. per 1,000 cub. ft. of space the total radiating surface would be 4,685 sq. ft.

All the distribution mains for steam and hot water are carried in subways of ample size, all with provision for being lighted by electricity. The total length of old and new subways amounts to about 1,600 ft. in all.

Water of condensation from the steam battery in the buildings warmed by hot air, from the steam-heating mains and branch pipes, and from domestic water-heaters and cooking apparatus flows back to the engine-room, where, with condensed water from the calorifiers, it is passed through cooling apparatus to the vacuum pumps and discharged thence into a water tank for use in boiler feeding.

Electric motors are employed in the engine-room for driving fans, pumps, and an ash elevator, and other motors are connected with

the fan for distributing warmed air in the Whitworth Hall and the Christie Library buildings. Connections are provided with the electricity mains of the Manchester Corporation for use in case of emergency.

HAMPSTEAD SEWERS: MAINTENANCE AND CLEANSING.

ALTHOUGH merely one among other units in the metropolis, Hampstead contains some 60 miles of sewers under the direct control of the Borough Council, in addition to 4 miles of main trunk sewers maintained by the London County Council.

In a paper read to the Institution of Municipal and County Engineers, Mr. Oliver E. Winter, the Borough Engineer, gives an account of his work in connexion with the maintenance, cleansing, and flushing of the sewers in the borough.

Many of the older brick sewers constructed between forty and fifty years ago have become defective, chiefly in the invert, which has mostly been constructed in brick with cement blocks or

cases. This has become worn with settling in places. The side walls and arch are of hard brick, but with wide joints in line often burnt ballast mortar. Consequently brickwork has become uneven with surface, and impossible to keep clean.

In many cases the sewers are large required, and where extensive repairs essential it is necessary to decide whether to reduce the size of the sewer by reconstructing in glazed stoneware of dimensions such make it self-cleansing, or to carry out without reduction of size.

Fig. 1 illustrates the reconstruction of a 3-ft. by 2-ft. brick sewer, constructed seven years ago, by laying a 15-in. diameter pipe inside and filling it around solid concrete. The pipe used in this case was grouted composite pipe joint made by Boulton & Co., Ltd.

Fig. 2 shows the repair of an old brick sewer where material reduction of sectional area not practicable.

The treatment illustrated is that of for inverts not so defective as to require pinning or the complete removal of the ring. The reinforced concrete invert was 2 in. thick in 2-ft. lengths with rebated. These inverts were made by the Imperial Company, and could be passed readily in sewer through manholes or side openings. They were bedded and jointed in mortar, and any depressions in the invert were filled with fine concrete.

To secure the inverts in position a continuous line of cement benching was formed along the side walls over each joint, enclosing the corbels and finished continuous line.

Mr. Winter states that several thousand of reinforced concrete invert have been laid in old brick sewers in Hampstead, with satisfactory results. The cost, including digging and laying complete, averages from 4s. 3d. per foot run, which is much less than of cutting out and renewing the brick.

Regular and systematic flushing of sewers is of great importance, and absolutely necessary for the purpose of keeping the sewer free from nuisance. For this purpose the borough of Hampstead is divided into districts, and two men are regularly engaged each of these.

Forty-two underground flushing tanks of capacity of about 2,000 gallons, are distributed at least once a week, the tanks being placed at points where they can be used to flush three, or more sewers by means of flaps.

The men who operate the tanks also look out the surface ventilators, see that the gratings are free from obstruction, and any defects.

In addition to the tanks, flushing is arranged at the apex of other sewer and are flushed out from time to time by means of a steam watering and flushing van of 2,000 gallons capacity.

3'0" x 2'0" BRICK SEWER.

3'9" x 2'6" BRICK SEWER.

CROSS SECTION.

LONGITUDINAL SECTION.

Fig. 2.

Hampstead Sewers.

rick sewers are systematically a gang of three or more men for removing deposits and of seeing main flaps are working freely. After cleansing of large brick sewers is fully charged at long intervals exceptional rainfall Mr. Winter has arranged consisting of a portable hose-pipes. The meter is attached to a hydrant and a 2½-in. hose-pipe is run from the meter to a manhole or side at the end of the hose is an attachment of two valves and smaller hose-pipes, arranged to spray down the sewer, where four men are spraying the walls and two men with bass and steel wire

states that very marked improvement has been evidenced since the adoption of this method of cleansing. It is described may not be so striking as that executed by the municipal engineer, but it is entirely hidden from the public eye, and it is of great importance, and means without interest.

WATER-SOFTENING PLANT AT YORK.

ation of water-softening apparatus at the works of Messrs. Rowntree & Co., was designed for the treatment of exceptional hardness, containing 51 grains of mineral salts per

water first passes over a water wheel 6 ft. diameter paddle wheel in a where milk of lime is kept in a state

next enters a Patterson "oscillating" measuring the water and adding reagents in predetermined proportions. This consists of a two-compartment tank with one compartment having an extension for the water overflows, causing the water to tip over and discharge the contents of the compartment while the other is brought in for the reception of more water. This, with each oscillation, scoops in the reagent chamber pick up and discharges a required quantity of chemicals for the water delivered by the oscillating

er and chemical reagents pass along a mixing trough, and then through a tank, 4 ft. in diameter and 25 ft. high, a vertical division causing the water to flow on one side and up the other.

the tower the water passes into a tank in a chamber 17 ft. 6 in. diameter, a large proportion of the suspended solids, the process being aided by a series of inclined plates, fixed at an angle to the horizontal, and dividing the water into several comparatively narrow

are filters are provided at the upper end of the precipitation chamber, through which the softened water passes and is drawn into a central collecting trough.

age at the bottom of the precipitation tank is removed by a system of drain pipes, with their mouths opening downward to draw away the sludge uniformly, merely from the vicinity of the

agents used are lime and sodium carbonate, the proportions required averaging 1 lb. of the former and 2 lb. of the latter for every 100 gallons of water treated. Chemical analysis shows that the softened water is of a very pure character, the small percentage of carbonate remaining in solution having no effect of loosening any scale in the steam boiler in which the water is used. The cost of the installation is 12,000 gallons

REINFORCED CONCRETE IN HYDRAULIC WORKS.

International Congress of Navigation, Newell, late Major in the United States Engineers, presented a Report summarizing communications submitted from various countries in Great Britain, France, Hungary, America on the uses of reinforced concrete in works pertaining to navigation, and kindred purposes.

The scope of the papers will be gathered from the following summary:—

Mr. R. W. Vawdrey, A.M.Inst.C.E., a director of the Patent Indented Bar and Concrete Engineering Company, Ltd., described canal bridges, piers and jetties, dock warehouses, and other structures in this country executed on the Considère, Hennebique, and Indented Bar systems.

M. Jacquinet, Ingenieur-en-chef des Ponts et Chaussées, of Chaumont, France, gave particulars of water tanks, embankments, revetments, aqueducts, canal towpaths, quay walls, jetties, and the encoirments of the Rue de Rome, Paris.

The Hungarian State Water Survey submitted details of a dam and lock at the mouth of the Körös River, and a lock on one of the arms of the Danube, near Budapest.

Signor Perilli, chief civil engineer, of Ravenna, Italy, described the Risorgimento Bridge, Rome, with the span of 100 metres constructed on the Hennebique system at the cost of 50,000l., various other bridges, siphons under the River Ombrone, a needle dam in the province of Ravenna, canal banks, wharves, landing stages, and barges.

Mr. R. L. Humphrey, President of the National Association of Cement Users, United States, dealt with the uses of reinforced concrete in canal locks, dams, harbour works, irrigation works, and for general purposes.

In commenting upon the foregoing papers, Mr. Sewell says that the conclusion seems justified that all the objections urged against the use of reinforced concrete as a material suitable for use in connexion with hydraulic works are either imaginary, or can be overcome by practical methods, and must have arisen at a time when the subject was not so well understood as at present.

The great advantage of reinforced concrete lies in the fact that it is capable of withstanding stresses due to transverse strains, tension, and shearing. Thus designs can be adopted wherein structural resistance rather than dead weight is the essential feature.

Dead weights on foundations are diminished, difficult excavation is avoided or lessened, and the cost of construction is proportionately reduced.

A study of the successful applications submitted to the Congress leads to the general conclusions that reinforced concrete combines the structural qualities of steel and timber with the durability of masonry; it is free from many of the limitations applying to masonry in mass; and in some cases it offers the only practicable solution of the most difficult structural problems.

A WATER-STORAGE PROBLEM.

EXPERIENCE has demonstrated the remarkable improvement effected by storage in the quality of river water, such as that drawn from the Thames by the Metropolitan Water Board.

It does not follow, however, that other classes of water are similarly improved by storage. A case in point is furnished by the trouble experienced at Gloucester with water derived from the lower oolite of the Cotswold Hills.

This water, it appears, is particularly favourable to the growth of the *Cara vulgaris*, a plant which develops very rapidly in the summer months, and in the autumn, when it begins to die down, the water becomes filled with secondary growth. The decay of the *Cara* is attended with discolouration of the water and the communication of a fishlike odour, supposed to be imparted by essential oil in the seed pods.

Mechanical means for clearing this growth from reservoirs have not been attended by successful results, and chemical treatment has been far more satisfactory.

The method adopted at Gloucester is to scatter copper sulphate over the surface, the quantity being never more than equal to the proportion of one part in 1,000,000 parts of water. At the end of three days not a trace of the salt is to be detected in the water, but what becomes of it is not known at present.

It is stated that the use of copper sulphate in this way has cleared the reservoirs effectively three times since the year 1905, relieving the filters of a considerable amount of work, and saving large quantities of water that were formerly wasted in emptying and cleaning the reservoirs.

ENGINEERING NOTES.

Metropolitan Water Reservoirs. In his Presidential Address to the Institution of Water Engineers Mr. J. S. Pickering stated that the completion of the reservoir at Chingford, with the capacity of 3,000 million gallons, will bring up the total reservoir capacity for unfilled water in the system of the Metropolitan Water Board to 12,800 million gallons, in addition to provision for the storage of filtered water to the extent of 311 million gallons.

A Curious Heating Boiler Explosion. In a report upon the explosion of a heating boiler at Bolton, it is stated that the mishap was due to the circumstance that the fire was lighted at a time when the circulation pipes were blocked by ice. The result was that the pressure in the water space of the boiler increased until the shell was ruptured, with injury to two persons. As a general rule, it may be assumed that heating boilers are kept at work during the prevalence of frosty weather, although it is often necessary to discontinue the use of hot-water supply boilers owing to the temporary stoppage of cold-water supplies. In any event, the explosion to which we refer emphasises the need for a conspicuous notice near every heating or hot-water supply boiler for the guidance of the attendant, stating the precautions necessary for safety at ordinary times and in or after frosty weather.

Brooklyn Navy Yard Dry Dock. In Vol. C we gave an account of the long series of troublesome foundation problems involved in the construction of the dry dock at the Brooklyn Navy Yard, New York.

The contractor who undertook the work after Congress had voted a million dollars in 1900 for the building of a dock 554 ft. long, and capable of accommodating vessels of 91 ft. beam, encountered so much running sand that he finally gave up the job in despair.

In 1908 another contract was made providing for the length of the dock to be increased to 620 ft., and this contract was cancelled in turn owing to further difficulties with sand.

Then a third contract was entered into in 1909 providing for increase of the dock to 726 ft. long by 110 ft. wide. The contractor had the valuable assistance of Mr. F. R. Harris, Civil Engineer to the United States Navy, by whom was worked out the mode of procedure adopted, and fully described in our previous article on the subject.

The new dock has recently been formally opened by the docking of the United States battleship *Utah*. So far as can be judged, the work is in every way satisfactory, a result reflecting great credit upon Mr. Harris and the contractors who had the courage to undertake the exceedingly risky and troublesome task of completing the dock.

Preparing Tar for Roads and Buildings. Mr. C. H. WEBB, of the district meeting of the Institution of Municipal and County Engineers, recently held at Stourbridge, described the Wilton's tar dehydrating plant, for the purpose of preparing gas tar for use on roadways. He said the special feature of this particular apparatus is that it is on the enclosed system, the tar being dealt with in a slow continuous stream, instead of in bulk. By this means the constancy of the finished product is more readily assured, and this is an important point when working to the Road Board's specification.

In the working process the tar is heated to about 320° Fahr., whilst under a pressure of about 30 lb. per square inch, and then released when the water and light oils, being at a temperature higher than their respective boiling points, are evaporated, and leave dehydrated and acid-free tar behind. The plant at Stourbridge is capable of dealing with 100 gallons—about half a ton—of crude tar per hour. The tar is supplied from the sale tank by gravity into a suction or feed tank, from which it is continuously pumped through a preheater or economiser, the coils of which are surrounded by hot, dehydrated tar. After absorbing some of the heat in this, the crude tar then passes to the still, which is a brick structure, containing about twelve laps of coiled piping, heated by a small breeze furnace, under forced draught.

The crude tar, when passing through the coil, is still further heated, and on leaving the still, the pressure is suddenly reduced in the vapour box, where there is a free space provided.

The water and light oils, being at a high temperature, are vaporised, and leave the tar, which latter flows away through the preheater, where it parts with some of its heat, on to the store tank, ready to be used for road preservation asphalt making, etc.

From the top of the vapour box the vapours pass through a coiled condenser surrounded by cold water, and thence to the receiver, where the ammoniacal liquor and light oils separate by gravity, and are utilised.

The plant must be worked, like all tar and ammoniacal works, under a certificate of registration of the Alkali, etc., Works Regulation Act, 1906, and is regularly examined by the Government Inspector. Packing of a ton of dehydrated tar requires five barrels, costing each about 6s. If eight journeys be made during the life of each barrel, the cost under this head is 3s. 1½d. per ton as against 4s. 2d. when only six journeys are made, a sum not to be neglected when the utmost economy in road covering is sought. By careful handling on the part of the railway companies, draymen, and roadmen the longer life can be attained.

Action of Cement and Liquids on Metals. The results of two series of tests given in *Armierter Beton* relate to the action taking place where copper, lead, and zinc are immersed in aqueous solutions in contact with cement or concrete, and where the same metals are embedded in cement or concrete.

The liquids employed in the first series included distilled water, tap water, solutions of calcium hydroxide, calcium carbonate, calcium bicarbonate, calcium sulphate, artificial sea water, cement water, and water where cement was present as a sediment.

The tests extended from one to twelve months, and the results showed that the access of air perceptibly increased the action upon the metals.

The results of the second series of tests indicated that copper embedded in cement cubes suffered less than where exposed to the action of cement water. Lead similarly embedded was attacked violently, and in the case of zinc chemical action took place causing the metal to adhere to the cement very closely, the surface of the zinc being covered by a layer of cement particles which could not be removed by ordinary rubbing.

An Ancient Timber Barge. DURING the excavation of a new water main in King's-road, Swanage, some interesting relics were discovered. The relic is partly on the site of a former creek, long since silted up, in which the workmen found an ancient barge, of more than 50 tons burthen, built of English oak, and with her timbers firmly secured by trenails. Near this vessel a flight of stone steps was uncovered, formerly leading down to the creek. It is believed that the barge is about five or six hundred years old, and that it was employed for the transport of stone quarried on the hillside and in the valley leading up to Corfe Castle.

It would be impossible to speak too highly of the work done by the Universities of London, Manchester, Liverpool, Birmingham, Leeds, Sheffield, and Bristol, and of the kindred work performed by the technical colleges which are scattered over the country.

At the same time there is no doubt that the older Universities of Oxford and Cambridge impart to students a tone which is somewhat lacking in the average student coming from the Universities and colleges of the newer type.

Business firms appear to be turning in an increasing measure to Oxford and Cambridge, because they look for character and stability as well as technical knowledge in young men who enter their employ. One result of this feeling is the decision of the Oxford University authorities to frame a curriculum with direct reference to a mercantile training, and another development of the same kind is denoted by the efforts of Lord Hythe and others to extend the facilities at the University for imparting training in engineering science, while not neglecting that liberal culture which is so valuable a feature of the older Universities.

The movement is one deserving the hearty support of the engineering profession, and if carried into effect the scheme will prove of great advantage to those who require something more than purely technical education after leaving school.

Lambeth Bridge.

It will be remembered that the London County Council Bill for the reconstruction of Lambeth Bridge at a cost of 240,000L. was rejected for three main reasons:—(1) That the amenities of the Houses of Parliament would be affected by the architectural design of the structure; (2) that the bridge was too narrow; (3) that the gradients were too steep.

Commenting upon these objections, the Improvements Committee of the County Council urge that the provision of 20,000L. in the estimate is adequate for the production of an acceptable artistic design and architectural treatment. On the question of width they point out that as the main approaches to the bridge are only about 40 ft. and 50 ft. wide, the proposed width of 48 ft. should be adequate, considering the position of this cross-river communication, and is equivalent to that of a street from 65 ft. to 70 ft. wide.

The question of gradients is one of some difficulty, and to make any important alteration in the project would involve raising the level of the Albert Embankment at the south end of the bridge, and the payment of compensation to property owners.

Having fully considered the objections made by Parliament, the Committee recommend the County Council to bring in a new Bill asking for power to reconstruct the bridge on the general lines proposed in 1911, but including certain modifications of structural character. From sketch designs submitted to them, the Committee are assured that there need be no difficulty in designing the bridge so as to comply with all reasonable aesthetic requirements. This last is clearly a matter on which independent expert opinion is necessary.

Resistance of Piles.

A PAPER in the *Annales des Pontes et Chaussées*, by M. Benabeng, discusses at length the load-bearing capacity of piles, the second part being devoted to the dynamic aspects of the subject. The author investigates the shock of the monkey on the pile with the recoil, considering the classic theory and other theories of the shock, and giving the general equation of the work of driving with the work due to vibrations, the work of compression, and the work of sinking. The author passes in review the various formulae proposed for calculating the resistance of piles, among them those of Redtenbacher, de Stern, de Brix, and empirical American formulae. The conclusions deduced from his study may be thus briefly summarised—Dynamic formulae merely afford approximate guidance in cases where piles are driven through soft earth to a hard stratum, and for this condition the new formula proposed is sufficiently accurate. On the other hand, formulae deduced from the static study of the question possess the advantage of being based upon an exact theory, and are applicable under all conditions to ordinary piles and screw piles. The general lesson to be learnt from the entire investigation is that the static method ought always to be adopted, since it is both exact and of general application.

Direct-Current Electrolysis of Iron.

In the *Journal of the Franklin Institute*, Mr. J. L. R. Hayden gives the results obtained by a study of the corrosion of iron by stray direct currents of electricity in the ground, such as occur where rails in electric traction systems are employed as return conductors. His conclusions may be thus briefly summarised:—(1) No definite ratio exists between the electrolyte corrosion of iron and the amount of current passing from the iron as anode, since the metal may assume a passive state in which corrosion is generally absent, or an active state in which corrosion follows Faraday's law; (2) the conditions governing the passive or active state are not fully understood, but it appears that an alkaline reaction of the electrolyte and the presence of nitrates or dichromates tend to produce the former, while sulphates and chlorides induce the latter; (3) the products of corrosion where occurring in the passive state are ferric compounds, and in the active state ferrous compounds; (4) the potential difference at the electrodes is much higher in the passive than in the active state.

Lectures on Reinforced Concrete.

On July 3 and 10 Noble Twelve lectures on concrete to the students of the Crystal Palace Practical Engineering. The first with the fundamental principles of concrete construction and the general beam design. The second lecture will be to the principles underlying the columns, struts, arches, and other structural elements, and to various practical construction in reinforced concrete. This lecture was illustrated by various types of reinforcing steel, as models and photographs of works of the United Kingdom.

Reinforced Concrete Fence Posts.

THREE English railways, viz., the Great Eastern, London and North, have been making use of reinforced concrete fence posts of a crescent-shaped timber. The life of a crescent post does not exceed twenty years, estimated that that of reinforced concrete be upwards of a hundred years.

The cost of the latter posts is about 10s. per yard, which can be greatly reduced if cement and iron can be obtained cheaply. It is estimated that that of wooden posts have been made of the same material results, trials made with all steel reported upon as unsatisfactory on the noise arising therefrom.

Both the above methods posts and are said to give great satisfaction.

Concrete Bench Marks.

THE Chicago Division of the establishment of bench marks where required, throughout the city, and says the *Journal*, have for several years been a system of exact levels, previously bench marks where required. The accompanying drawings, the standard marks are of concrete, with the base below surface level. The concrete truncated square pyramid 6 ft. high sides 3 ft. 6 in. wide at the base, square at the top. In the top is a round copper rod, and over the rod a cast-iron frame, 8 in. square inside, cast-iron cover locked in place and opened by a simple steel key. The bench marks is about 6 ft. each in concrete, copper rods, covers, and moulds. Up to the end of 1910 the had constructed nearly 200 bench marks described.

STEEL KEY

SECTION A-B

SECTION C-D

Standard Construction for Bench Monuments in Chicago.

(From the Municipal Journal.)

The different suggestions which have been made in this matter relate to the position of different schools and the constitution of their consultative Committees, and also to the difference between North and South London. It might be unwise to form a number of these Committees immediately, but it seems from experience of the work of other consultative Committees that the most satisfactory method of dealing with the matter will be to appoint Consultative Committees dealing with specific

branches of the building trades, and giving them as their field of operations the whole of the London area, including the School of Building at Brixton. It is possible that a wise course to adopt would be to have nominees of the Committee at Brixton on the other committees. We therefore suggest that the following Consultative Committees should be formed at an early date:—

(1) Consultative Committee on painters' and decorators' work. (2) Consultative Committee on plumbers' work and gas fitting.

When these Committees have been set in operation, they might usefully be followed by Committees on:—(a) Carpentry and joinery, (b) brickwork, masonry, and plastering, and (c) architecture; but we do not think that it would be wise to initiate these latter Committees until the first two Committees are in operation.

Subjoined is the complete series of decisions arrived at by the Education Committee:—

"(a) That it be pointed out to the Institute of Builders—(i.) that the Council is unable to consider any scheme of apprenticeship involving the payment of premiums; (ii.) that the Council is in agreement with the Institute of Builders as to the desirability of elaborating a scheme of training of boys in which proper provision would be made for theoretical training at technical schools on two (or more) afternoons a week, and would be glad to co-operate in any such scheme so far as arranging for the provision of suitable classes and instruction is concerned; and (iii.) that the fixing of a scale of wages for 'premium' and 'non-premium' apprentices is not a matter which comes within the Council's purview, and that the Council is unable to allocate scholarships for this purpose.

(b) That it be pointed out to the London Association of Masters Decorators—(i.) that the Council is in a position to train immediately twenty boys per annum at the Brixton School of Building, and that very shortly it expects to be able to train thirty others per annum from schools in the north and west of London; (ii.) that the Council will expect the Association to assist the Council in the placing of these boys with reputable firms on an approved scale of wages for a period of three years; (iii.) that the Council is prepared to afford facilities for afternoon and evening classes in north, west, and south London whenever a suitable number of applicants is forthcoming; and (iv.) that the Council proposes to form a consultative committee for painting and decorating trades, with a view to increasing the scope and utility of the technical classes provided.

(c) That, as from September, 1912, ten additional trade scholarships per annum be established at the London County Council School of Building (Brixton) for boys who are less than fifteen and not less than thirteen years of age in the year of award who intend to specialise in the trade of painting and decorating; and that the scholarships consist of free tuition for a period of three years, together with maintenance grants of 6s. for the first year of the course, 10s. for the second year, and 15s. for the third year.

(d) That, in the opinion of the Council, a day trade school, giving a three-year course of instruction to prepare boys for employment in certain branches of the building trade, should be established at the Northern Polytechnic (Islington, E.), as from September, 1912; and that the governing body be so informed.

(e) That, as from Easter, 1913, fifteen additional trade scholarships per annum be established at the day trade school at the Northern Polytechnic (Islington, E.) on similar conditions to those set out in resolution (c).

(f) That, as from September, 1912, the building section of the day trade school at the London County Council Hackney Institute (Hackney, S.) the building trade scholars elected in 1911 and 1912, and the ten trade scholarships awarded annually for building trades tenable at the London County Council Hackney Institute (Hackney, S.), be transferred to the Northern Polytechnic (Islington, E.).

(g) That, as from September, 1912, ten additional trade scholarships per annum be established at the London County Council Hackney Institute (Hackney, S.) for boys who are less than sixteen and not less than thirteen years of age in the year of award who intend to specialise in engineering; that the scholarships consist of free tuition for a period of two years, or, in a few special cases, for three years, together with maintenance grants of 6s. for the first year of the course, 10s. for the second year, and, if extended, 15s. for the third year.

(h) That a special estimate of expenditure on maintenance account of 310s. for the financial year 1912-13, and estimates of expenditure on maintenance account of 680s. and 138s. for the financial years 1913-14 and 1914-15 respectively, under standing orders Nos. 221 and 228, submitted by the General Purposes Sub-Committee for the purpose referred to in resolution (d), and of the development of the existing day technical school at the Northern Polytechnic, be forwarded to the Finance Committee.

(i) That the special estimate of expenditure on maintenance account of 310s. for the financial year 1912-13, and the estimates of expenditure on maintenance account of 680s. and 138s. for the financial years 1913-14 and 1914-15 respectively, submitted by the Finance Committee for the purpose referred to in the foregoing resolution (h), be approved as estimates of costs, debt, or liability under sect. 80 (3) of the Local Government Act, 1888.

(j) That, subject to the annual maintenance votes for the respective years, including the necessary provision therefor, the block maintenance grant to the governing body of the Northern Polytechnic (Islington, E.) for the school years 1912-13 and 1913-14 be increased from 8,020s. to 8,493s. and 8,800s. a year respectively; and that the matter be referred to the Finance Committee for payment.

(k) That a special estimate of expenditure on maintenance account of 80s. for the financial year 1912-13, and the estimates of expenditure on maintenance account of 890s., 820s., 1,360s., and 1,260s. for the financial years 1913-14, 1914-15, 1915-16, and 1916-17, and subsequent years respectively, submitted by the General Purposes Sub-Committee for the purposes referred to in the foregoing resolutions (c), (e), and (g), be forwarded to the Finance Committee.

(l) That the special estimate of expenditure on maintenance account of 390s., 820s., 1,360s., and 1,260s. for the financial years 1912-14, 1913-15, 1915-16, and 1916-17, and subsequent years, submitted by the Finance Committee for the purposes referred to in the foregoing resolution (k), be approved as estimates of cost, debt, or liability under sect. 80 (3) of the Local Government Act, 1888.

(m) That on the remaining portion of the vacant site adjoining the London County Council Hackney Institute School of Arts and Crafts (Hackney, S.) a new art school be provided, and that the present art school be adapted to use as a building trades school; that the building trades school do become the centre for building instruction in the west of London, and that the building classes from the Finsbury Technical Institute be transferred thereto; that a day trade school be established therefor for the building trades, and that the school be a separate institution; that a principal be appointed thereto; and that the Education Committee do submit the necessary recommendations in due course to give effect to this resolution.

(n) That consultative committees be appointed on the subject of: (i.) painters' and decorators' work; and (ii.) plumbers' work and gasfitting; and that the Higher Education Sub-Committee do report thereon."

CONCRETE-MIXERS. THE "OPEN DRUM" MIXER.

THIS machine is a batch mixer, of simple design and sound construction. As implied by the name, its distinctive feature is the open drum, which is cylindrical in form, with the body made of steel plate, to which is added a conical top narrowing the area over which the mixed concrete is discharged.

The interior of the drum is fitted with blades riveted to the shell and parallel to each other. The bottom of the drum consists of a cast-iron pan, fitted with the circumferential rack by means of which the drum is rotated, and with a short central shaft working in a ball bearing provided in the supporting frame of the machine. The side standards of the frame carry the necessary gear for driving the machine and tilting the drum to discharge the concrete.

When in position for mixing the drum is tilted at an angle of 45 deg., as shown in Fig. 1. The blades in conjunction with the rotary motion of the drum do not merely carry the

Fig. 1. The "Open Drum" Concrete-Mixer.

material to the top and then let it fall, but cause a kind of pouring process by which the materials are rapidly and thoroughly mixed.

Special appliances are unnecessary for loading the drum, because the open top and its nearness to the ground permit wheelbarrows to be employed for placing materials in the drum, providing a suitable incline is made up to the loading platform.

The entire time required for loading, mixing,

and discharging each batch of concrete by the makers to be about two minutes.

To discharge the mixed concrete it is necessary to tilt the drum, this operation being easily performed in the larger machine by aid of worm gear operated from the platform. In the smaller machine the gear is operated by hand, and in the larger by either hand or power.

One advantage claimed for the open drum is that when discharged no concrete will

Fig. 2. The "Open Drum" Concrete-Mixer.

left inside. Another advantage is that it affords for inspection of the material the whole process of mixing. Consequently it is claimed that all uncertainty as to the amount of water is eliminated, and that of an automatic water-tank need not be used.

The "Open Drum" mixer is made in sizes of from 2½ to 18 cubic ft. capacity can be obtained in more than twenty styles to meet varied requirements.

The makers are Messrs. Goodwin & Co., of Leicester, who are also manufacturers of a continuous type cylindrical concrete well as flat macadam mixers, mortar stone-breakers of various types.

BUILDERS' BENEVOLENT INSTITUTION.

MR. F. G. RICE (President) presided at the Wednesday afternoon at the offices, House, Kingsway, over the annual meeting of the subscribers Institution.

MR. T. Costigan (Secretary) submitted his sixty-fifth annual report, as follows:—The committee of management have to submit their sixty-fifth annual report, and desire to express their deep gratitude to the President (Mr. F. G. Rice) for the valuable and hearty help he has rendered to the Institution during the last twelve months. Grateful acknowledgment is due to Mr. Henry F. Higgs for his kind memory of "L. A. H." The function to be administered with the greatest thorough investigation is given in appeal made. During the past year five female pensioners have died, grants having been made where and one man and six women have been added to the list of pensioners. There were twenty-eight male and twenty-five female pensioners. The committee give thanks for their valuable assistance. President (Mr. F. G. Rice), to the Hon. Mr. F. J. Dove, Sir Arthur C. L. Mr. Frank May, Mr. T. F. Rider, Mr. and Mr. John T. Bolding; to the Hon. Mr. John T. Bolding and Mr. H. F. C.A., and to the dinner stewards. Mr. Minster has kindly accepted the post of the coming year, and subscribers are earnestly urged to support his presence and generous assistance at dinner, which will be held in the Rooms, Hotel Metropole, W.C., on November 14. The next election of will be held in November."

On the motion of Mr. Carter, Mr. Stirling, the report was adopted. Mr. J. T. Bolding proposed that the accounts, and said the annual sum was 403s., as against 427s. last year, the weak spot of the Institution. T. subscriptions were getting fewer each in his early years with the Institution used to get 600s. or 700s. a year source. No doubt the decrease was due to the holding of the annual dinner everyone connected with the trade asked to assist the Chairman, and hardly expect people to give dona-

h too. The donations were 30l. last year, which made the subscriptions 1,380l., or within 30s. of 1,410l. Their total interest receipts were 4,727l. The pensioners' account for 1911 amounted to 1,799l. 6s., as against 1,799l. 6s. in 1910, or 98l. less. The expenses were 1,364l., against 1,357l., and interest, advertising, and postages 126l. 11s. The balance at the bank was 1,799l. 6s.

seconded the motion, and it was carried. The effect of the alteration to the effect that the circuit of eligibility for a pension be extended from 12 miles from Charing Cross. He at the last election two candidates most suitable in every other respect ruled out owing to the fact that they were not within the circuit of eligibility. The present radius of eligibility. The circuit was made sixty-five years ago, would all agree that the district miles of Charing Cross was really very small.

May seconded the motion. The effect, whilst not altogether opposed to the motion, pointed out that their present pensioned 83 square miles, and if the circuit were carried they would add a further 73 square miles, and they would include many more pensioners. A large number of builders' pensioners was of what he might term a "character." Hence they would be very seriously liable which required consideration.

able discussion followed as to what the effect of the extension, and the opinion seemed to be that whilst it might be a fresh help could be given for from the added districts, yet it would be extended so far as the funds would allow.

ally the motion was agreed to. The motion of the Chairman, Mr. F. G. Wilson, elected President for the year. May was re-elected Treasurer, and a vote of thanks was accorded him for his services in the past.

question of the re-election of the President, Mr. May moved that the question of nomination of the names of members for the next year should be considered. That Past Presidents should become members of the committee as vice-presidents, and that the executive committee be limited to fifteen.

seconded the motion. The course of the discussion which ensued, thought they would be taking too much time in carrying such a motion, for to remember that even if the whole of the meeting did not attend the meetings would be liberal supporters of the motion.

he subsequently withdrew his motion as he had attained his object in raising the question.

ter considered the idea of having past-presidents as members of the committee ought to be dropped, and suggested that their names could be placed in the list.

net with general support, and was carried.

ing moved a hearty vote of thanks to the retiring President, and expressed the hope of everyone in hoping Mr. Rice would meet the members in the future.

iding seconded the motion, and it was carried.

he briefly acknowledged the compliment, and any efforts of his would have been without the loyal assistance of the members and the committee.

MARBLE CONTRACT AT THE BRITISH MUSEUM.

Monday, Mr. Tyson Wilson asked the representative of the First Commissioner of Works if he would now state the reasons which led the Office of Works to permit the contractors for the marble work in connexion with the British Museum to sublet part of the work to the abroad. Mr. Wedgwood Benn replied by sanctioning the subletting of a small part of the marble work at the British Museum, extension, the Office of Works were not principally by the facts that such a system is customary in the trade, and that in question can be executed more easily abroad.

TRADE DISPUTES.

It seems idle to be talking of trade activity and commercial prosperity at a time when we are confronted with labour unrest, which has created a record in the loss of working days. In the first six months of this year 37,444,000 working days have been lost through trade disputes. Many of the 1,260,461 workpeople involved were highly paid, and the loss in wages is, therefore, colossal. Some idea of what the loss, and the consequent diminution in spending power is, may be gathered by simply computing each working day at the very low rate of half-a-crown, as this alone shows a loss of 4,680,500l. in wages in six months, and, added to this, the trade union resources have been squandered in strike pay. Nothing like such a loss of time is to be found in the records published by the Board of Trade. In the year 1893 there was a great dispute in the coal trade, and that year was the highest recorded for loss of working days, but in that whole year the loss of time was under 31,000,000 working days as compared with the 374 million recorded in the past six months. Since 1893 the years with the greatest loss in working days have been 1898, with just over 15 million; 1908, with 103 million; and 1910, with 94 million. These figures are for the whole year. Can any country continue prosperous with a loss of time and wages such as is shown in the first half of this year? It has been a period of trade prosperity which to some extent has mitigated the evil results of this labour unrest, but periods of trade prosperity are not continuous, and slack times must come. Never has a prosperous time been so lost advantage of, and when trade activity lessens the pinch will be bitterly felt in this country. It behoves all classes at the earliest possible opportunity to devise a *modus vivendi* which shall secure industrial peace and retain our foreign trade.

LONDON MASTER BUILDERS' ASSOCIATION: MONTHLY REPORT.

THE Council of the London Master Builders' Association met on July 18, the chair being occupied by James S. Holliday, President.

The Special Committee appointed to confer with the representatives of the various trade organisations submitted its reports of the several Conferences which had been held, which were unanimously adopted.

The reconstitution of the Law and Parliamentary Committee in respect to important legal cases affecting members of the Association was approved and adopted.

Correspondence relating to trade matters was read.

The following firms were nominated for Associate membership:—Messrs. C. Burley, Ltd., Sittingbourne; Messrs. Samuel South & Son, Edmonton.

THE INSURANCE ACT AND THE CEMENT TRADE.

IN the House of Commons on July 17, Mr. Rowlands asked the Secretary to the Treasury whether his attention has been called to the printed form being handed to the late employees of the Associated Portland Cement Manufacturers, Ltd. (1900), at their works in Northfleet and Swanscombe, when the men give their names for re-employment after the strike, with verbal instructions that it be filled up and returned as soon as possible, the employees being asked whether they are members of an approved sickness benefit society, and, if not at present members, whether they would be prepared to join an approved society instituted by the Associated Portland Cement Manufacturers for the working of the Act on behalf of its employees, and, if at present members of an approved society, whether they would agree to transfer to such Associated Portland Cement Manufacturers Society; and whether he proposes to take any action in the matter in view of the provisions of the National Insurance Act? In reply, Mr. Masterman said that he had not seen the form in question, but understood that the Associated Portland Cement Manufacturers, Ltd., have been considering the formation of an approved society under sect. 25 of the Act, and issued an inquiry of the kind indicated with the intention of discovering how many of their employees were likely to join the society, if formed. On the information before me I see nothing in the action of the firm which calls for intervention on the part of the

Commissioners. Mr. Rowlands: Was it made a condition of reinstatement?—Mr. Masterman: I have no information on that point. Sir G. Parker: May I ask the right hon. gentleman whether he will communicate with the company, asking them whether they have made it a condition of re-employment?—Mr. Masterman: Yes, I think I am prepared to do that.

GENERAL BUILDING NEWS.

NEW CATHEDRAL, WELLINGTON, NEW ZEALAND.

A Roman Catholic cathedral is to be erected in Wellington. The plans of the cathedral have been completed, and the foundation-stone will probably be laid before the end of next year. The name and address of the architect is Mr. J. S. Swan, Kilburne-avenue, Wellington, New Zealand.

PROJECTED NEW BUILDINGS IN LONDON.

First portion of Australian Commonwealth-buildings, Aldwych, W.C.; Messrs. A. Marshall, McKenzie, & Sons, architects, 1, Victoria-street S.W.; Messrs. Holloway Brothers, builders, Victoria Wharf, Belvedere-road, Westminster, S.W. Sorting office, Brixton, S.W.: Messrs. Pasterfield & English, builders, Sunny-hill-road, Streatham, S.W. School, Wimbledon, S.W.: Mr. Charles H. Cooper, Surveyor, Town Hall, Wimbledon, S.W. Sorting office, Coburn-road, Bow, E.; Mr. H. Hann, builder, High-street, Collier's Wood, Merton, S.W.

TRAINING COLLEGE, CAERLEON.

This building is being erected at an estimated cost of 26,000l., from the designs of Mr. A. Swash, F.R.I.B.A., and his son, Mr. F. S. Swash, A.R.I.B.A., architects, of Newport. The building will be of three stories to provide accommodation for 100 students. The contractor is Mr. F. Bond, of Cardiff.

PUBLIC LIBRARY, ENFIELD.

On July 13 a new public library, the gift of Mr. Andrew Carnegie, was opened at Enfield. The architect was Mr. Richard Collins, Surveyor to the District Council, and the builders were Messrs. Fitch & Cox, also of Enfield.

TRADE NEWS.

Under the direction of Mr. Walter Wallace, architect, Kirkcudbright, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "airpump" ventilators and air-inlets, has been applied to Dundrennan School, Dundrennan.

The Governors of Seale-Hayne College (Agricultural and Technical), Newton Abbot, Devon, have accepted the tender of Messrs. Petrick Brothers, Ltd., contractors and granite merchants, Laira Bridge, Plymouth, for the erection of the Seale-Hayne College buildings.

The Bishop Eton Monastery, Woolton, is being supplied with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Farnsworth, Manchester.

The Excellence Wood Block Flooring Company, of 90, Cannon-street, E.C. (works, Prospect Saw Mills, Leeds), have recently carried out alterations and repairs to the wood-block flooring at the Old Gaiety Restaurant (now Marconi House) for Messrs. Collis & Sons, builders. They have also laid their patent dovetailed grooved flooring recently at a number of other premises.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses:—)

Width of Way, Projections, and Construction.

Hoxton.—Construction of an external iron gangway and an external iron gangway and staircase at a building to abut upon Worship street, Clifton-street, and Merritt's-buildings, Hoxton (Mr. R. W. Hobden).—Consent.

Formation of Streets.

Dulwich.—Formation or laying-out of a new street for carriage traffic to lead from Underhill-road to St. Aidan's-road, Dulwich (Messrs. Cane & Co.).—Consent.

Lines of Frontage and Projections.

Deptford.—Erection of a building at the rear of No. 110, Lewisham High-road, to abut upon Malpas-road (Mr. E. C. Arter for Mr. Clark).—Consent.

Dulwich.—Four houses on the southern side of East Dulwich-road, Dulwich, with porches and bay-windows (Mr. H. G. Blackmore for the Gordon Carriage Works).—Refused.

Fulham.—Erection of a one-story addition at The Chalet, Fulham Park-road, Fulham, next to Fulham Park-gardens (Mr. J. Darch for Mr. A. J. Layton).—Consent.

Hackney, North.—Erection of bay-windows, porches, and overhanging eaves to ten houses on the western side of Springfield-gardens, Hackney (Mr. F. Collins).—Consent.

Hackney, North.—External iron staircase in front of a warehouse building on the northern side of Barrett's-grove, Hackney (Mr. J. H. Storar).—Consent.

Islington, East.—Erection of buildings upon the sites of No. 2, Holloway-road and No. 4, Highbury-crescent (Mr. H. C. Constantine).—Consent.

Kensington, South.—Projecting sign in front of No. 141, Kensington High-street (Messrs. Stanley Jones & Co., Ltd.).—Consent.

Newington, West.—Erection of buildings on the western side of Walworth-road, between Amelia-street and Steedman-street (Messrs. Buckland & Garrard for the Midland Railway Company).—Consent.

Strand.—Projecting clock in front of No. 132 Long-acre (Greenwich Time, Ltd.).—Consent.

Wandsworth.—Erection of porches, oriels, windows, bay-windows, and overhanging gables at Nos. 103 and 105, Down-on-avenue, Streatham-hill (Mr. J. Copp).—Consent.

Woolwich.—Two one-story shops in front of No. 62, Plumstead Common-road, Woolwich (Mr. J. O. Cook for Messrs. J. H. Sutch & Sons).—Consent.

Width of Way.

Hampstead.—Building at less than the prescribed distance from the centre of Belgrave-place, Hampstead (Mr. A. F. Faulkner for Mr. W. Willett).—Consent.

Width of Way and Construction.

Fulham.—Two temporary wood and iron buildings in a yard on the eastern side of New King's-road, Fulham, adjoining arches Nos. 407, 409, and 411 of the District Railway (Messrs. Cole & Shuttleworth, Ltd.).—Consent.

Width of Way, Frontage, and Construction.

Strand.—Iron and glass shelter at the entrance to the Loudoun Hotel, Surrey-street, Strand (Mr. P. C. de Lafontaine for Mr. W. Gaultlett).—Consent.

Line of Frontage and Deviation from Certified Plan.

Marylebone, East.—Re-erection of No. 23, St. Edmunds-terrace, Hampstead (Mr. J. C. Pocock for Sir Boverton Redwood, Baronet).—Consent.

Space at Rear.

Hoxton.—Erection of a water-closet building on the flat at the rear of No. 209, Kingsland-road, Hoxton (Mr. R. S. Powell for the Mary-street Estate Company).—Consent.

St. George, Hanover-square.—Erection of a building abutting upon Warwick-row, Prince's-row, and Brewer-street, Westminster (Messrs. A. E. Hughes & Son for Messrs. F. Gorrings, Ltd.).—Consent.

Uniting of Buildings.

City of London.—Uniting of Nos. 5 and 6 with No. 7, Paternoster-square, City, by means of an opening at the first-floor level (Mr. J. S. Heath for Messrs. Jacobsen & Welch).—Consent.

Finsbury, East.—Uniting of Nos. 27 and 28, Glasshouse-yard, Finsbury, with premises at the rear (Messrs. J. R. Pitcher & Son for Messrs. F. H. Ayres, Ltd.).—Consent.

Hoxton.—Formation of an opening in the party wall at the ground-floor level between Nos. 72 and 74, St. John's-road, Hoxton (Messrs. P. H. Clarke & Son).—Consent.

St. George, Hanover-square.—Uniting of Nos. 33 and 34 with No. 35, Half Moon-street, St. George, Hanover-square, by means of an opening at the basement level (Messrs. Martin & Sons for Mr. Hug).—Consent.

Westminster.—Uniting of Nos. 14 and 16, Victoria-street, Westminster, by means of an opening at the fourth-floor level (Messrs. Z. King & Son for Mr. R. T. Raikes, Mr. H. Hiscoc, and Mrs. L. Lean).—Consent.

The recommendation marked * is contrary to the views of the Metropolitan Borough Council concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

BERKSHIRE.—Schools at Bucksburn and Stonywood (3,000l.); Mr. G. B. Mitchell, architect, 148, Union-street, Aberdeen.

Ainsdale (Lancs.).—Vicarage (2,000l.); Rev. G. Z. Edwards, The Vicarage, Ainsdale.

Alnwick.—Parish hall, Painter-hill; Mr. H. W. Knowles, architect, Collingwood-street, Newcastle-on-Tyne.

* See also our list of Competitions, Contracts, etc., on another page.

Bedlington.—Twenty-two houses for the Netherdon Coal Company, Ltd., Cathedral-buildings, Dean-street, Newcastle-on-Tyne.

Blackburn.—Drying shed for Messrs. Whitaker & Co., Ltd.

Boston (Lincs.).—Restoration of Guildhall; Messrs. Sherwin & Son, builders, Wide Bargate, Boston.

Bristol.—Proposed baths; Mr. T. H. Yabbin, Engineer, Town Hall, Bristol.

Bucksburn.—Additions to school for the New-hills School Board.

Burton-on-Trent.—Receiving home (1,770l.); Mr. H. G. Adams, builder, 7, Wyggeston-street, Burton.

Chalvey.—School (5,000l.); Mr. Riley, architect, County Education Office, Aylesbury.

Chatham.—Twenty-two houses, Mount-road; Mr. C. E. Skinner, builder, Railway-street, Chatham.

Chirk.—Drill hall; Mr. C. D. Rutter, architect, Wrexham; Messrs. W. H. Thomas & Sons, builders, Salop street, Oswestry.

Colwyn Bay.—Proposed fifty houses; Mr. W. Jones, Surveyor, Town Hall, Colwyn Bay.

Cranborne.—Institute; Mr. W. Watson, builder, London-road, Ascot, Berks.

Crossabeg (Ennisorthy).—Roman Catholic church; Messrs. W. H. Byrne & Son, architects, Suffolk street, Dublin.

Dumbarton.—Baths; Mr. A. C. Denny, architect, 37, Church-street, Dumbarton.

Dunfermline.—Reconstruction of opera house (9,000l.); Mr. J. D. Ewanston, architect, Kirkcaldy.

Durham.—Laundry (7,000l.); Mr. L. G. Elkins, architect, West Blandford-street, Newcastle; Mr. J. White, builder, Sunderland.

Eastleigh (Hants).—Isolation hospital; Mr. W. W. Gandy, architect, Eastleigh, Hants.

Edinburgh.—Building, Canaan-lane (5,000l.); Mr. D. McCarthy, architect, 25, Frederick-street, Edinburgh.

Exmouth.—Erection of Marine-drive (20,000l.); Mr. S. Hutton, Surveyor, Council Offices, Exmouth.

Fishponds (Bristol).—Memorial hall; Mr. W. Froud, architect, St. Stephen's-chambers, Bristol.

Gloucester.—Fire-station; Mr. W. T. Nicholls, builder, St. Paul's-road, Gloucester.

Gomersal.—Proposed rebuilding of part of central premises (5,000l.) for the Co-operative Society.

Grays (Essex).—Repairs to school (475l.); Messrs. Brown Brothers, builders, Grays.

Great Bridge.—School (800 places); Mr. J. E. Pickles, Town Hall, West Bromwich.

Great Yarmouth.—A plan has been passed for five houses, Fulgrave-road, for Mr. F. Grimble.

Harrogate.—Extensive additions to Cairn Hydro for Cairn Hydropathic Company, Ltd.; Messrs. Bland & Bown, architects, North Park-road, Harrogate.

Haswell (Co. Durham).—Picture theatre; Mr. J. Garry, architect, 47, Church-street, West Hartlepool.

Hebburn.—Four houses, Argyle-street (710l.); Messrs. S. Oake & Co., builders, Tennant-street, Hebburn.

Heywood.—Warehouse, Simpson Clough, for Messrs. Barker Brothers, dyers, 534, High-street, Manchester.

Horsham.—School, Denne-road (1,915l.); Mr. L. Thompson, County Hall, Horsham.

Hull.—Workshops, stables, etc., Stepney lane (7,760l.); also stables and car sheds, Cleveland-street (2,210l.); Mr. C. Greenwood, builder, Hull.

Keighley.—Additions to hospital for the Keighley and Bingley Joint Hospital Board.

Kettering.—Alterations to public baths (5,000l.); Mr. T. R. Smith, Surveyor, Urban District Council Offices, Kettering.

Lancing.—Parish hall; Mr. O. S. Doll, architect, North-street, Brighton.

Leek.—Offices at gasworks (900l.); Mr. Sampson Salt, builder, Overton's Bank, Leek.

Leigh.—School (2,280l.); Messrs. Goddard & Sons, builders, Dorking.

Lianduno.—Police buildings (4,600l.); Mr. J. Holt, architect, 8, Albert square, Manchester.

Lowestoft.—School, Romanhill (6,323l.); Mr. Abel Round, architect, 1, Newhall street, Birmingham; Messrs. G. & H. Marshall, builders.

Manchester.—Abrasive material works for the Carborundum Company, Ltd., Hull.

Methie.—Theatre; Mr. J. D. Ewanston, architect, Kirkcaldy.

Monaghan.—Dispensary (2,300l.); Surveyor, County Council-buildings, Monaghan.

Montrose.—Shelter (600l.); Mr. S. L. Christie, Surveyor, Burgh Hall, Montrose.

Mossley.—Offices for the Victoria Spinning Company, Ltd., Elder-street, Rochdale.

Mountain Ash.—Isolation hospital; Mr. G. Thomas, Surveyor, Urban Council Offices, Mountain Ash.

Newbiggin.—Stores and houses for the Newbiggin Sanitary and Water Supply Co., Ltd., Newbiggin.

Ossett.—Offices, Pildacre-lane, for Mr. Fitton & Sons.

Pelsall.—School (2,200l.); Mr. J. H. County Offices, Stafford.

Peterborough.—Enlargement of workhouse infirmary (850l.); Mr. George Brown, Surveyor, Peterborough.

Plimpton (near Plymouth).—Territorial quarters; Messrs. Ellis, Son, & Bowdler, Bedford circus, Exeter.

Port Talbot.—Theatre; Mr. Morgan, builder, Sea View, Aberavon, Port Talbot.

Preston.—St. Cuthbert's Church; Mr. Moore, architect, 37, Old Queen-street, minister, S.W.

Queensborough (Kent).—Offices & Works; Mr. W. L. Grant, architect, street, Sittingbourne.

Ramsbottom.—Extensions to works of Bradford Dyes' Association, Ltd.

Ryton (Co. Durham).—Church hall & rooms; Mr. G. Bell, architect, 34, 1/2, street, Newcastle; Mr. T. Charlton, Newburn, Northumberland.

St. Albans (Herts).—School, Stanbury; Mr. H. Fim, architect, St. Albans; Mr. Skelton, builder, Blandford-road, St. Albans.

St. Anne's.—Premises for Messrs. J. Deacon's Bank, Ltd.; Mr. W. C. architect, Chesterfield; Mr. James, builder, 51, Booth Ley-road, Blackpool.

Sholden.—Alterations and additions to Chase Club House; Mr. J. Jefford, builder, Walmer.

Southampton.—Residence; Mr. Poole, architect, 340, Balham Hill, Upper Tooting, S.W. Additions, ca. 1890; Mr. H. F. Street, T. Manager, Southampton.

have been passed for four houses, B. avenue, for Mr. J. Smith, and four Newton-road, for Mr. F. Lowe.

Stratford-on-Avon.—Twenty-four (3,495l.); Messrs. T. Barker & Sons, 14, Swan-street, Loughborough.

Surrey.—New schools at Hook, Hersham (500 places), Byfleet (3,910l.), also additions to school, C. (1,920l.); Mr. H. Ramsay Nares, Court Kingston-upon-Thames.

Swanscombe (Kent).—School; Mr. Dunstall, architect, Bank-chambers, Swanscombe.

Swansea.—Business premises, 6 place, Mr. Henry C. Portsmouth, 6 street, Swansea.

Tibshelf.—Picture theatre; Mr. J. son, architect, South Nortonham, Alf.

Troon.—Church; Mr. J. A. Morris, architect, Wellington-chambers, Ayr.

Twickenham.—Buildings at Orleans (800 places); Mr. F. W. Pearce, S.W. Urban District Council Offices, Twickenham.

Walloway.—Town Hall, North Mead (94,000l.); Messrs. Briggs & Thorneley, architects, Richmond, Blackburn.

Watford.—Additions at Old C School; Messrs. G. Wiggs & Sons, Albans-road, Watford.

Winchester.—Electric theatre; Houston & Houston, architects, 1, Le W.C.

Wood Street (Surrey).—Alterations, 28, Chertsey-street, Guildford.

Yarmouth.—Additions at factory Nicholas-road, for Messrs. Grant & crane manufacturers.

Yorkshire.—Sanatorium (16,000l.); Mr. Edwards, architect, County Hall, Wakefield.

GOVERNMENT BUILDING CONT.

MR. PORTER, on Monday, in the Commons, asked the representative of the Commissioner of Works whether, in the fact that the maintenance and work on the various Government buildings more or less of a regular character, in many cases the same workmen performed the work for years, although tracts have changed hands, he will have consideration given to the advisability of employing these workmen direct and to the profits of contractors.

Mr. Benn, in reply, said:—Long and consideration has already been given question of the advisability of employing the workmen referred to in the Where it is found desirable, work employed direct by the Department, generally it is found that the employment of workmen through contractors under the system is more efficient and economic.

AND BRIDGE, SURREY : CONTROVERSY RECALLED.

the generation is paying very heavily for the men of the past, and the calls of the Richmond and Twickenham with regard to the improvement of river traffic arrangements at this seriously enough, almost the same amount as those of their forefathers and a half ago.

early times at this point a ferry to which many allusions are made of the privy purse expenses of Mary, and Elizabeth, and in 1607 leased by James I. to Messrs. and Edmund Sawyer, of London, for the sum of 13s. 4d. a year, however, had, by the time the was mooted, been raised to "The lease in 1770 was a Mr. whose lease expired in 1798, and the sum possesses a coloured print, bridge of nine arches to be built at Mr. Windham, partly of wood, stone, and dated 1772. In order position of affairs at that time the sketch, which has been prepared in 1741, shows the land on the river and the portion of the existing, and it may be noted that buildings on the Richmond side up improvements at the foot of Hill and the lines of the old plan. approaches were exceedingly steep, dated that an old woman used to livelihood by means of a few chairs to rest on halfway up the slope. position of affairs in 1772, and a entitled:—

The Case of the inhabitants of Richmond to a Bridge between Richmond the opposite shore. 1773.

one, H. Reynell, near Air-street, which shows the arguments for and of whom Mr. Windham. Windham a petition for leave to introduce the House of Commons for building a the ferry and enabling the King to the inheritance of the ferry, and the people appointed a Committee to the matter, for as they were afraid bridge was "to be built at his to be his private property, cheap- attended to in the construction public conveniences," and also on the general unsuitability of the site, position induced Mr. Windham to the Bill.

Committee then set to work to produce a theme, and was of opinion (and the end of George-street was the ion and that Water-lane leading to be widened accordingly. Had none the present traffic difficulty been almost non-existent.

But, too, was considered inadvisable, express of the gradient at Perry-hill or eyes, an outstanding drawback. Committee also drew attention to the access on the Twickenham side, that either an embankment or a over a portion of Twickenham Farm necessary, and to the objections of the

farm owner that it would spoil his view and "destroy the beauty and form of the grounds," the Richmond people answered that the prospect would be "improved by the addition of an elegant stone bridge near the end of Water-lane, and also pointed out that the land was subject to inundations and other disagreeable things, and to the "inroads of bargemen."

However, the forces against the Richmond party, whether Mr. Windham or the Twickenham farm owner, or, as one writer hints, the objection of a royal personage, carried the day, and the present bridge—"a palpable inconsistency," as one Richmond worthy calls it—was erected, with its tortuous approach and steep gradients, which latter were altered about 1830, as may be noticed by an inspection of the balustrade, when it will be seen that the roadway does not follow the line of the coping, but is nearer to the top at the ends. The money for the undertaking was provided by a tonnage—20,000*l.* for the first, and a second of 5,000*l.*, and the bridge was a toll-bridge till March 25, 1859. Looking back over the discussion, it is interesting to note the clear way in which the Richmond people realised the situation, and it is exasperating to think that the present generation are fettered by the obstinacy of the past, for the opportunity is now gone, it is to be feared, for ever, of building a bridge on George-street, as the Twickenham side, once farm land and country lanes, is now a thriving residential suburb, and financial reasons alone are a sufficient objection to the making of new roads on that side. The alternative to widening Richmond Bridge may mean the partial loss of a bridge worthy of the old town of Richmond and an ornament to the river side, but the present traffic problem must be solved, and delay will only mean increased cost.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Chylesmore, Chairman, presiding.

Loans.—The Finance Committee recommended that loans be made to Borough Councils and other authorities as follows:—Wandsworth, 3,000*l.* for acquisition of an open space; Battersea, 1,500*l.* for acquisition of an open space; Hackney, 58,100*l.* for electricity undertaking; Kensington, 1,760*l.* for street improvement; Shore-ditch, 4,139*l.* for electric lighting purposes; and Poplar and Stepney Sick Asylum District Managers, 2,160*l.* for provision of lifts.

St. Paul's Bridge.—In a report presented by the joint Improvements and Highways Committee it was recommended that authority be sought in Parliament in 1913 for the construction of (1) tramways from Southwark-street, over the proposed new St. Paul's Bridge to a point near the most western end of Cheapside; and (2) the construction of a shallow underground subway, with the incidental works connected therewith; and (3) the construction of junction lines between the tramways in Southwark-street and those in Southwark Bridge-road at the junction of those thoroughfares.

London University Site.—The Chairman of the Local Government Committee was asked whether his attention had been called to the proposed acquisition of the Foundling Hospital site for the new London University buildings, and whether, as this proposal, if carried into effect, would undoubtedly involve the destruction of a part, if not the whole, of this old building, he would ask the Committee to consider if steps could be taken by the Council to prevent such vandalism, especially if it could be shown that the existing building could be saved and possibly used for such a purpose as that of the London Museum.

The Chairman, in replying, said that his attention had been called to the matter, and if the proposal to house the London University on the site were carried out there could be little doubt that it would be necessary to destroy a part, and possibly the whole, of the existing building on the site. He promised, however, to bring the matter before the Committee.

THE NEW IMMINGHAM DOCK.

In connexion with the opening by the King on Monday, 22nd inst., of the new dock at Immingham, a knighthood was conferred on Mr. Sam Fay, general manager of the Great Central Railway Company.

LEGAL COLUMN.

Workmen's Compensation.

The Court of Appeal, in a recent case, *White v. Wiseman*, had once again to consider how the average weekly earnings of an injured workman ought to be calculated under the Workmen's Compensation Act.

The workman was engaged in the electroplating trade, and had been employed by the same employer for at least twelve months, but part of that time he had been employed on time work, part on piece work. This, it is to be observed, involved no change of grade under Schedule 1, par. 2 (b), therefore the whole period of employment during the twelve months preceding the accident could be regarded. The question really involved was whether certain periods during which the workman had to work short time ought to be regarded in arriving at the average. The County Court Judge had excluded such periods, and the Court of Appeal now held that he was wrong in so doing. The case is really concluded by authority—viz., by a decision of the Court of Appeal in *Bailey v. G. H. Kenworthy* (the *Builder*, January 11, 1908), and of the House of Lords in *Anslow v. Cannock Chase Colliery Company* (the *Builder*, January 2, 1909), but there is some difficulty in applying the principles laid down in these decisions.

If the earnings for twelve months be added together, that will give the man's earnings for a year, but if this sum is divided by the number of weeks in the year, it will not necessarily give the average weekly earnings, as there may have been some weeks in which there was no work. The Act by Schedule 1, par. 2 (c), provides that average weekly earnings shall so be computed as is best calculated to give the rate per week at which the workman was remunerated. If a stoppage of work is a normal incident to the trade, as, for instance, by fixed holidays, this must be taken into consideration, and the amount earned in the year must only be divided by the number of weeks work was available. On the same principle, if, as in the case under consideration, working short time is an incident of the employment, this must be regarded in totalling the earnings and arriving at the weekly average. If, however, a man takes a holiday or is prevented from working by a casualty, this does not affect his earning capacity, and such interruptions need not be taken into consideration.

Contracts with Local Authorities.

SECT. 174 of the Public Health Act, 1875, provides in sub-sect. (1), that "every contract made by an urban authority whereof the value or amount exceeds 50*l.* shall be in writing and sealed with the common seal of such authority." The facts in the case, *Hoare v. Kingsbury Urban District Council* (the *Weekly Notes*), recently tried in the Chancery Division, show the importance of public attention being drawn to the above sub-section.

The plaintiff was owner of a building estate which on one side for a length of 1,000 ft. abutted upon a public road, a narrow lane 20 ft. in width, and on a higher level than the plaintiff's land. The plaintiff deposited plans for the erection of thirty-six houses fronting this lane. The Chairman of the Council suggested that the plaintiff should set back his houses and level up his land, and throw a strip 20 ft. wide and 1,000 ft. long into the roadway, and that in consideration of this the Council would adopt the strip of land as part of the roadway and would make it up as a public road with a footway adjoining his land. An agreement on the above lines was prepared by the Chairman and signed by the plaintiff, and this agreement and the plans were approved by the Council; but the agreement was not sealed. The plaintiff performed all his part of the agreement, the Council took possession of the strip of land, erected three lamp-posts upon it, and connected them with the gas mains at the other side of the road. They obtained the sanction of the Local Government Board for a loan to make up and sewer the lane, and advertised for tenders; but there they stopped short, and, despite repeated applications on the part of the plaintiff made to them to fulfil their part of the agreement, did nothing. In an action for specific performance of the agreement, the Council pleaded first the Statute of Frauds, and, secondly, sect. 174 of the Public Health Act. This was the first intimation the plaintiff received that the contract had not been signed or sealed. The defence under the Statute of Frauds failed, as the defendants had taken possession of the strip of land and there had been part performance; but the Court held that as the defendants did not purport to make the agreement as a highway authority, and the contract was for more than 50*l.* in

Ferry, with the adjacent Streets.
A Survey made in 1741.

As to Messrs. Rowley Brothers, his said that the plaintiff set up a building relating to the estate, and he had in establishing a building scheme. His belief on a building scheme from Lordships' decision was that the plaintiff's building scheme should not be applied to a portion of an estate, provided that which the scheme was applied sufficiently defined. His Lords were not concerned with leases nor giving to each purchaser a right upon the enforcement of the stipulations in them relating to the last other purchaser. The plaintiff was entitled to enforce the stipulation in the lease with which the only one was as to the relief to which he was entitled. The plaintiff's house was a dwelling facing the road, and the house adjacent of the same character. Beyond the defendant's a triangular piece of land was nothing but a building, and the plaintiff to say that such piece should be kept open. The defendant had given their approval to the Messrs. Rowley Brothers building, with a building line. So far as seen from the plaintiff's house, it was an ordinary dwelling-house. In opposite the triangular land were shops. The result of the evidence the plaintiff was such as to lead to the conclusion that the defendant had paid a penny piece, and he said he did not believe that the plaintiff's house had been reduced in the defendants', however, were to treat him as having suffered some loss into Court 50/- without admitting if the plaintiff had been well advised would have taken that sum and so paid to the action. He was now pressing the defendant's contention to put the defendant's building in this position, however, that he ought not to make order, which would be a great loss to the defendants, and would not confer any on the plaintiff. The defendants, however, said that the plaintiff was not to have the sum out of Court by way of for the infringement of his rights, the plaintiff had succeeded in obtaining that which his rights had been intended to give, and that the plaintiff must be paid by Messrs. Rowley Brothers.

Chairman and Members of the Council of Llantrisant.

called upon to assume the judicial tribunal, and the Court could not be faulted for saying that he would not

CHANCERY DIVISION.

Dispute as to Tenant's Rights :
Appendrodt v. Rosedale.

urged, on behalf of the defendant, that he was entitled to do what he had done, under the covenant in the lease to repair; but his Lordship decided that he could not do the acts complained of under the guise of repair.

Their Lordships held that the judgment of Mr. Justice Joyce was right, and dismissed the appeal with costs.

Finchley.—Plans have been passed for the

Finchley Co-Partnership Society, showing amaking up, paving, and sewerage, etc., the roads adjoining the Royal Albert Hall, subject to the type of artificial flags being satisfactory. The carriageway of Argyle-street is to be widened by setting back the footway on each side of the street for a distance of 70 ft. southwards from Oxford-street, at an estimated cost of 285*l*. In connexion with the paving of the Mall-approach, the tender of either the Acme Flooring and Paving Company (1904), Ltd., at 422*l*. 13*s*. 4*d*., for pine paving, or that of Messrs. William Griffiths & Co., Ltd., at 537*l*. 10*s*., for combined strip paving, is to be accepted, subject to an understanding with H.M. Office of Works, as to which of the two kinds of paving shall be laid. Subject to protective conditions, the offer of Mr. I. Davis, 20, Cockspar-street, managing director of the Electric Pavilions, Ltd., is to be accepted for taking over for the remainder of the Council's lease of the Orange-street Baths, which he intends to convert into a cinematograph theatre at a cost of between 4,000*l*. and 5,000*l*. Subject to the approval of the Marylebone Borough Council to the proposed widening at the corner of Oxford-street and Park-lane, tenders are to be invited for carrying out the necessary paving works, which the Engineer estimates at 830*l*. exclusive of alterations to main, cables, and boxes, which will probably not exceed 200*l*. Plans have been passed for Messrs. L. S. Mouchel & Partners for additions to the British Motor-Cab Company's premises, Grosvenor-road; as have also plans for Mr. E. Wimpey for the Grosvenor Estate Board for the erection of buildings on the south side of Oxford-street.

Hackney.—The sewer in part of Pedro-street is to be reconstructed with 12-in. glazed stoneware pipes for a length of about 127 ft., and with 9-in. glazed stoneware pipes for a length of about 330 ft., at an estimated cost of 106*l*. The estimates of the Borough Surveyor, of 380*l*. and 629*l*., have been approved for making up, as new streets, parts of Portesque and Grandson avenues, respectively. Electricity mains are to be extended in various parts of the district at an estimated cost of 426*l*. Plans prepared by Messrs. Gordon & Gunton, of extensions to the electricity works, have been approved. Mr. W. R. Hood, 8, Union-court, Old Broad-street, E.C., has, subject to the usual sanction, been appointed quantity surveyor in connexion with the building of the North-west Branch Library, at a remuneration of 1*l*. per cent. on the structural cost of the building. The tender of Messrs. A. & S. Wheeler, 193, High-street, Stoke Newington, has been accepted, at 4,545*l*., for the erection of a branch library at Homerton. The following plans have been passed:—Mr. G. Butters, factory, rear of No. 5, Shore-road, South Hackney; Messrs. H. Bradford & Sons, eight houses, Wellington-road; Messrs. J. E. Whitler & Co., additions to factory, Mare-street; Messrs. Sheffield Brothers, warehouse, Retreat-place; Messrs. F. Boreham, Son, & Gladding, conversion of Nos. 60 and 62, Stoke Newington-into picture theatre; Mr. J. S. Alder, additions to St. Barnabas' Mission-buildings, High-street, Homerton.

Heston and Isleworth.—Electricity mains are to be extended at an estimated cost of 850*l*. Plans have been lodged by Mr. W. E. Eburne for the conversion of the "Courtney Arms" public-house into houses; also by Messrs. Roper, Son, & Chapman for six houses in Standard-road, Hounslow.

Islington.—Repairs are to be carried out to portions of the carriageway of Highbury-crescent at an estimated cost of 118*l*. The wood paving in the upper portion of Hornsey-road is to be renewed at an estimated cost of 550*l*. Electricity mains are to be extended at an estimated cost of 580*l*.

Poplar.—Plans have been passed for Mr. A. R. Emerton for the erection of a cinematograph theatre on the site of Nos. 71 and 73, Parnell-road.

St. Pancras.—1,786*l*. is to be provided in the next estimates for repaving the sides of a portion of Camden-road, including the tramway margins, with cross-tied deal blocks. Repairs are to be carried out to the macadam roadway of Anglers-lane.

Stepney.—Electricity mains are to be extended in two roads. Subject to protective conditions, Mr. W. Verrey, 60, High-street, Whitechapel, E., is to be allowed to build over the sewer at the premises mentioned. Plans have been lodged with the London County Council by Mr. D. P. Hayworth for the erection of additions to No. 264, Burdett-road; also by Mr. D. Goldberg for the erection of a building in Great Garden-street.

Watford.—The tender of Messrs. Clifford & Gough, at 1,415*l*., has been accepted in lieu of that of Messrs. Bracey & Clark, for the erection of a public convenience in Church-street.

West Ham.—Increased accommodation is to be provided at the Harold-road Handicraft centre. The following plans have been passed:—Messrs. Ward & Ward, cinematograph theatre, Green-street; Mr. W. H. Allerton, seven houses, St. Mary's-road, Plaistow; the Ford's Park Co-operative Bakers; Ltd., alterations and additions to bakery, etc., 44, Plymouth-road, Canning Town; Mr. F. Parnell, extensions to cinematograph theatre, Adamson-road, Custom House; Mr. W. Jacques, Women's Settlement, Barking-road, Canning Town; Messrs. Fuller, Horsey, Sons, & Co., alterations and additions to the late Vinolia Company's premises, Carpenter's-road, Stratford; Mr. J. Wardle, laundry, Humberside-road, Plaistow; Mr. H. Cundy, cinematograph theatre, Richmond-street, Plaistow; Mr. C. J. Dawson, fishmeal factory, Carpenter's-road, Stratford.

Westminster.—The tender of Mr. T. Coulthard, 113, Eaton-terrace, S.W., has been accepted at 116*l*. for carrying out certain alterations at the City Hall. Repairs are to be carried out to a portion of the wood-paving and foundations in the Strand at an approximate cost of 140*l*. A portion of the wood-paving in Piccadilly is also to be relaid at an estimated cost of 70*l*. The tender of the Acme Flooring and Paving Company (1904), Ltd., has been accepted, at 10,620*l*. 4*s*. 1*d*., for

OBITUARY.

Mr. F. J. Macaulay, A.Inst.C.E.

The death, on July 18, at his residence, "Alverstoke," Clapham Common, is announced of Mr. Frederic Julius Macaulay, F.R.G.S., aged eighty-two years. He was educated at Carrickfergus and Belfast, and when twenty years old entered the service of the London and South Western Railway Company; he was appointed Secretary in 1880, and eighteen years afterwards was invited to a seat on the direction. He was a promoter of the Waterloo and City electrical line, and the Westminster and Lyme Regis light railway, and was for a while chairman of the Demerara Railway Company. He was a Governor of the Railway Benevolent Institution, and was closely associated with the founding of the Union Jack Club.

"I KNOW OF BUT ONE ART."

THE practice of the Renaissance was such that it often seems there was but one art, and that artists, from their general training, themselves competent to work at painting, sculpture, and architecture quite apart from the possessions. For not only were great able to use this triple expression but innumerable less talented. The system which taught their craft—their apprenticeship workshop or *bottega*, where all activity prevailed—may have been possible for this to some extent, it was of equal importance was of life towards art; it demanded something of it. Its various and innumerable of life, all had to be by its golden hand. "All things and household use, drinking-bottles, instruments of music," no detail of domestic or religious but became the sufficient workman, and as such was always fair. It filled "the common ways with the reflection of some far-off

brightness." Art was, in fact, not a thing apart from the manifold activities of life, but the crown and head of them.

The distinction, as we know it, between the beautiful and merely useful did not exist. And although, in their lives, it may seem to us that the exuberance of passion and joy sometimes overflowed into excesses, yet, on the whole, it was buoyant and beautiful. It was, indeed, as if life itself, in its labyrinthine course, was inspired by art to natural and joyous issues. The many activities of poetry and art, of religion and philosophy, had in the XVth century in Italy a common starting-point, a common course to run, and this oneness of aim gives a peculiar character to the age. A new world was shown to men who found it a fair and wondrous place in which it was well to live. It was like the coming of dawn—the still grey silence of the end of night, the fleeting stars, the hushed expectancy, and then the rapturous breaking into song of all nature at the advent of the sun. Such, it seems to us, was the Renaissance which culminated in the middle of the XVth century.

The tendency of the age, that there

was but one art, is exemplified by several great men—by Leonardo, whose insatiable curiosity led his spirit into the mazed bypaths of experiment, but still better by Michelangelo, whose strength was greater, if his curiosity was less, than the other. For one brief moment these two men, the greatest of their time, appear in competition. When Michelangelo had finished his "David" in 1504 he was given a commission to prepare a cartoon to place in the Palazzo Vecchio on a wall opposite that already apportioned to Leonardo, whose famous design, the "Fight for a Standard," was already in preparation. Michelangelo chose for his subject an episode from the war with Pisa, when a band of Florentines were surprised bathing in the Arno, by Sir John Hawkwood. The subject supplied the artist with the *motif* he loved—nude figures of men in the varied attitudes expressive of haste and surprise. Both cartoons have perished, but they can never have seriously been in competition with one another; for each summed up an epoch. Both were personalities of commanding stature. Michelangelo, however, seems to stand more apart from the

current of life. He appears a solitary brooding figure, like his own "Moses." But better than any other artist he gave to his art this threefold expression in works which can never be surpassed. In the Sistine Chapel he painted a vault that is at once painting, sculpture, and architecture. The Chapel of the Medici shows architecture and sculpture wedded as they have never been since the days of Pericles, and at last he was permitted to build his dome of St. Peter's among the clouds. Lorenzo Bernini, a century later, practised architecture, painting, and sculpture. He was called the Michelangelo of his century, and Ruskin joined them together in a common ridicule to make an epigram. Bernini still is so little considered that the English biographical dictionaries do not even mention his name. It was he, it will be remembered, who gave Wren a glimpse of his plans for the Louvre. Why Ruskin's slight should have been allowed to obscure the undoubted talents of this great artist is exceedingly strange; for no man, if we except Wren, has been able to give a character to a city as he has done. The scale of Rome, as we see it to-day, is really that of Bernini, not of Ancient Rome, as is so often imagined. And to condemn him because of his leaning to the "Barocco" is to make him responsible for the tendencies of his age. But if one will, calmly and without prejudice, study the work of this period, he will find much that is stately and noble, that the "florid efflorescence" had little in common with the gigantic measure of Bernini. He built altars, tombs, and palaces in a great style of design.

Bernini, in his life, was treated in princely style, popes and kings vying with one another to obtain his services. Besides his many architectural works, he produced an innumerable number of statues, busts, and paintings. He also wrote for the theatre. Indeed, his energy was such that no form of activity came amiss to him.

Since then art has been so much subdivided that it is difficult for an individual to combine in himself the technique necessary for the practice of a threefold expression of art. In architecture, for example, the exigencies of planning are so complicated that it almost becomes a separate branch of art or science, and many other considerations make it increasingly difficult to do other than specialise.

But what is necessary for the health of art is a mutual understanding of its various branches. Alfred Stevens was the last great artist who attempted to practise the triple expression of art and who achieved notable work in every one. When he entered the competition for the Wellington Memorial he chose for his motto, "I know of but one art," a paraphrase of the *Vé un arte sola* of Michelangelo. Unfortunately, he was adequately employed in none, and nothing is more tragic than to examine a collection of his sketches, which are invariably for something never carried out. Yet we suppose his Wellington Memorial is the finest monument in England, and his few designs which were carried out possess a rare quality of beauty. But there is that against this practice of universality—that the artist

may be neglected. Art itself, however, does not suffer—in Stevens's case it was quite the reverse. It should be possible, however, to adopt a middle course which would still be for the good of art, and which would at the same time advance the reputation of the artist.

The old system of the Italian *bottega* is no longer possible. This is our undoubted loss; for in these, workshops were continued from generation to generation, a tradition in a state of growth or increase. The numerous legends of pupils surpassing their masters simply means that technique had moved on a step. To-day it may be said that all technical methods are fixed, there is growth in them no more; they can be learnt by almost any clever student. But, unfortunately, they are scarcely taught, and the student has to move in a welter until he discovers his trade for himself. The old system gave a perfect training in mere workmanship.

Besides a profound knowledge of his own particular craft, the artist should understand the scope of the various expressions of art. Easel-painting may stand apart, but decorative painting, sculpture, and architecture cannot; they touch one another at so many points, their orbits cross and recross, so that a mutual understanding is essential to their health. Architecture, indeed, if she is to remain the Mistress Art, must know intimately her fair handmaidens—painting and sculpture. Whether they will ever dwell together in one fair mansion as they did in the age of Phidias, and in the XVth and XVIth centuries, lies entirely with artists. If they accept the larger issues of art as a part of life they can disregard none of its manifestations, but must cherish and understand them. For *Vé un arte sola*, which with paint and marble and stone builds up beautiful conceptions of the earth and the divine form of man—and, in architecture, the most impersonal in its expression, raises out of the quarry, as if by some magic music, ordered and harmonious piles, eternal as the impassive hills. One spirit presides over their birth—painting, sculpture, and architecture—and gives them a beauty beyond that of the world.

FURTHER IMPROVEMENTS AT THE MARBLE ARCH.

THE mere idea of shops in Park-lane strikes, as it were, at the roots of British respectability. Park-lane is, or rather was, considered the sacrosanct dwelling-place of all who are most blue in blood and faultless in lineage. We wonder how such a rumour would have been received a generation or so ago, by Thackeray's world of Vanity Fair, for instance? You can picture the uplifted hands, the shocked looks, and almost hear the outcry of Mayfair that the world was going rapidly to the dogs. On the present occasion the removal of an inn parlour from a country town would seem to have caused more emotion. It was not even reported that an American had bought the threatened site and presented it to the nation. The truth is that the glory of Park-lane is passing. Since gold was discovered in South Africa the thoroughfare as a place

of residence would seem to have been these days the prestige of vast wealth, and not add to the amenities of a residential neighbourhood. Shops in Park-lane, notwithstanding, would have been an ill-advised scheme, and we are glad to see that it has been abandoned. There are plenty of streets and sites in the immediate neighbourhood which are much more suitable for business purposes. The Grosvenor Estate is to give 60,000l. for public improvement at Marble Arch, which will include a particular corner of Oxford-street. Park-lane which was in danger of being widened at the junction of the street will now be widened at the junction by 16 ft., and Park-lane, at the other end, by 10 ft., the junction of the thoroughfares being rounded off by an additional 27 ft. being thrown into a public thoroughfare. The actual area of the land ceded by the Grosvenor is 5,139 sq. ft. This is a considerable gift, and we are quite ready to share in the expression of gratitude which Mr. F. W. Speaight, in the printed on page 142, considers to be due to the donors. We are even inclined to include in that expression of gratitude Mr. Speaight himself. It is not often that a member of the public shows so much public spirit and enterprise as Mr. Speaight manifested seven years ago, when the agitation for the improvement at the Marble Arch first began to arouse the attention of the man in the street. Mr. Speaight, in the forefront of that agitation, devised schemes for the consideration of the public authorities, and he neither his energy nor his pocket in effect to his ideas. In the summer of 1905 we commented on a pamphlet proposed improvement which he then recently issued, illustrated by and perspective drawing by Mr. Davison. The scheme, which has been largely carried into effect, and no doubt will now be complete, full, propounded the forming of a semicircular place and leaving the arch in its present isolated position. Arguments were brought against the arch as a solitary feature in the plan; and, curiously enough, at very time the authorities in Park-lane becoming disturbed about the grandeur of Fontaine and Percier's *Triomphe du Carrousel*, erected by Napoleon in the Tuileries Gardens. French authorities proposed continuing the arch with balustrades; but as our observation goes when we leave the arch, in the spring of the present year this has not been done. But we leave the arch solitary? It agrees with historical precedent; the triumphal arches of the Romans were, we know, invariably allocated to individual and lonely sites; and just as the *Triomphe du Carrousel* was a copy of the Arch of Severus, so John Nash, the designer of the Marble Arch, derived his inspiration from the Arch of Constantine. But the Marble Arch in its original position in front of the chief entrance to Buckingham Palace was not a triumphal arch, nor did it carry the sense that the arches were, although, as it was to carry the royal banner, we may say that it more or less expressed the

bol. It was removed from its position in 1851, as it was not the design for building the of Buckingham Palace. As as designed by Nash, and as reliefs were modelled by not to speak of its cost, which, and the almost unsuspected material is marble from the Carrara), it is perhaps entitled respectful artistic consideration ally receives. Its metal gates, and cast by James Parker, are some attention.

improvement at the Marble not been received with complete aesthetic grounds, there can not that the change has been the better; it has certainly what town-planners call the "of the site, and to our arch has gained enormously tive feature. As a means for ation of traffic the improve compare favourably with that metropoliton readjustment for purpose of recent times. Pre the alteration this was one most congested cross-thorough- London. There is now no traffic more speedily negotiable. ot of time and nervous worry the course of the year to the who daily use the route must rable. The absorption of the corner of Park-lane in the theme will assist in giving the h of completeness which was the first instance by those who it.

NOTES.

SINCE publishing the article in our last issue on this subject we understand that an Approved for architects' assistants is timed at the suggestion of the Rural Association, who are in ation with the Royal Institute of Architects and the Surveyors' with a view to circularising ubers of all three bodies ely. Our only doubt at the riting as to the success of such y was based upon what we to be insufficient numerical but if these three bodies ombined membership is close a thousand) act together, and ubers unite in pointing out to employed by them the un- advantages of such a society, d prove a great success and ficial to all those employed tects' and surveyors' offices. an be no doubt that, given numbers, the additional benefits e greater than those offered ties which admit members of grades, professions, and trades. rulate the Architectural Asson their enterprise.

We understand that the expert committee appointed to advise the ment of India respecting the site e plans for the new Delhi has ed the position of the site and ral idea of the plan. The most

important feature of the new city, we are told, will be Government House and its precincts, to be designed by Mr. E. L. Lutyens, which will face a wide avenue forming a vista, terminated by the Jamma Musjid; so connecting the old with the new. The native Moghul style of architecture not having been considered suitable, it is proposed to erect the new buildings after European Renaissance models, modified to suit the peculiar climatic conditions of the country. An open space of parkland, some 1,000 yds. wide, will be left between the old cities and the new. The committee, we learn, will return to India in December, by which time a beginning can be made with building operations. The main connecting avenue will be begun as soon as possible after the rains, which in this district cease in September. Considering the great importance of this scheme, and its high political and Imperial significance, it would be most interesting if the plans could be published before the work is actually carried out.

The Small Landowner.

LORD LANSDOWNE'S recent speech in the House of Lords, and the still later pronouncement of Mr. Bonar Law at Blenheim, commits the Unionist Party to a policy of legislation on behalf of the small landed proprietor which has already been inaugurated by their political opponents. The effect of this policy will have considerable influence on the practice of architecture. According to Mr. Bonar Law, the Unionist Party proposes to give the small holders the "security and pride of ownership." The breaking-up of large landed estates has for some time been in progress. The change, therefore, which is being effected will ultimately largely change the character of building operations in rural districts. This opening up of the land and large addition to the number of small proprietors, not to speak of the general increase of the rural population, will no doubt give a considerable impetus to building in places where building hitherto has been the last thing contemplated. A multitude of farms and cognate buildings will take the place of solitary manor-houses and large residences. We are not, however, inclined to view this change with the dismay with which it is regarded by architects whose practice has been chiefly concerned with the latter type of building. The conditions of life are rapidly altering; both political parties are committed to policies which tend in a socialistic direction, but (and this fact ought to be kept in view) not more so than our continental neighbours. Whatever our personal feeling may be, it were folly not to realise what appears to be the *Zeitgeist*, a world movement that is in progress, and not to accept it seriously. If the change contemplated by Lord Lansdowne and Mr. Bonar Law is successful in its effect, communities of varying size and importance will occupy spaces which are at present practically without population. The creation of architecture, both civic and private, will necessarily follow in the steps of any such development. And it need not be feared that the rich will remain without their dwelling-

places. A change in the mode of life of the rich may also involve a change in the type of building which they inhabit, but, in any case, it will bring into operation the skill and art of the architect.

The Fatal Fire in Moor-lane.

The regrettable fire on the evening of Tuesday, July 23, resulting in the death of eight poor girls engaged on the top floor of a factory and warehouse, calls attention to the necessity for the greatest precautions to ensure safety from fire in workshops and other places where materials of an especially inflammable nature are in daily use. With all our existing regulations, official inspections, and appliances for the prevention and extinction of fire it seems almost incredible that such a catastrophe should have occurred, but we think it best to defer our comments upon this particular building and the disaster which befel it until the Coroner's inquiry, now being held, is concluded. In our next issue we hope to give the conclusions arrived at independently, after an inspection of the premises made shortly after the fire under the courteous guidance of Lieut.-Colonel Fox, the Chief Officer of the London Salvage Corps.

THE EXAMINATIONS.

THE Preliminary Examination, qualifying for registration as Probationer R.I.B.A., was held in London and the provincial centres indicated below on June 10 and 11. Of the 171 candidates admitted, 49 were exempted from sitting, and the remaining 122 examined, with the following results:—

	Number Examined.	Passed.	Reluctated.
London	64	39	25
Birmingham	7	4	3
Cardiff	8	3	5
Glasgow	6	6	0
Leeds	12	11	1
Manchester	20	15	5
Newcastle	5	3	2
	122	81	41

The passed candidates, with those exempted, making a total of 130, are as follows:—

J. Addison, Aberdeen	C. S. T. Calder, Edinburgh
G. D. P. Allen, Cambridge	R. W. G. Card, Birmingham
J. R. Armstrong, Edinburgh	B. P. Carter, St. Anne's-on-Sea
L. J. Ashby, Nottingham	J. Chapman, Sanderstead
M. A. Atalls, London	R. E. Chardin, Woodford Green
A. S. Bagshaw, New Cross	E. E. Clamp, New Cross
P. W. Barnett, Hornsey	G. G. Clark, Seaton
P. Batstone, Lee	C. Carew, Gillingham
P. V. Beirstein, Kensington	G. E. Cruickshank, High Barnet
G. G. Bennett, Stratford	D. C. Cunnell, Norwich
H. A. Benson, Aldershot	M. N. Das, Rochester
F. G. Bethel, Douglas	D. De, London
C. C. Bethell, Bush Hill Park	B. De Keisly, Stockport
J. R. Blake, Malvern	D. C. L. Derry, Hampstead

The Intermediate.

The Intermediate Examination, qualifying for registration as Student R.L.B.A., was held in London and the undermentioned provincial centres on June 10, 11, 13 and 14. One hundred and nineteen candidates were examined with the following results:—

Centre	Number Examined	Passed	Rele- gated
London	82	42	40
Cardiff	5	4	1
Glasgow	4	2	2
Leeds	8	4	4
Manchester	15	4	11
Newcastle	5	2	3
	119	58	61

The passed candidates are as follows, their names being given in order of merit as placed by the Board of Examiners:—

W. E. Foale, London
J. C. Rogers, London
R. S. Wilshire, Fins-
bury Park
G. Shuffrey, Ealing
A. F. Kallenbach,
Hornsey
H. E. Rolley, Kensing-
ton
F. C. L. Toye, Wood
Green
W. Alison, Glasgow
S. Rubery, Wolver-
hampton
H. P. R. Atchison,
Kensington
E. A. L. Martyn, Red-
ruth
A. L. Horsburgh, Lon-
don

J. Macpherson, Not-
tingham
W. J. Durnford, Ken-
sington
J. O. Thompson, Shef-
field
S. J. H. Pryne, Ken-
sington
E. M. Parkes, North-
wich
W. S. Foster, East-
bourne
J. C. Farrer, London
G. H. Gray, North
Shields
W. V. Lawton, Knares-
borough
P. Whitehead, Alnwick
D. E. Cruickshank,
High Barnet

C. H. James, Cardiff
H. M. Woodhouse,
Queenborough
W. J. Knight, Cardiff
A. O. Kersey, St.
Beolings
A. F. Purvis, London
R. C. Arnold, Ilford
P. Stoner, North-
ampton
E. H. Child, Hamp-
stead
P. Skeiding, Bristol
L. A. Elsworth, Leeds
A. Nisbet, Portobello
V. Bain, London
C. A. R. Barry, West-
minster
H. J. Binetingsl, Ken-
sington
C. K. Blyth, Canon-
bury
M. C. Broad, London
A. D. Clare, London
H. E. Crossland, C.
Sutton-in-Ashfield

The following table shows the number of failures in each subject of the Intermediate Examination:—

I. Classic Architecture	30
II. Medieval Architecture	43
III. Renaissance Architecture	44
IV. History of Architecture	39
V. Theoretical Construction	35
VI. Descriptive Geometry	22
VII. Applied Construction	29

Exemptions from the Intermediate.

The following Probationers, possessing the certificates required under the regulations, were exempted from sitting for the Intermediate Examination and have been registered as Students, viz:—

A. S. G. Butler, Ken-
sington
B. F. Gaymer, London
R. McKay, Edin-
burgh

L. D. Martyn, Stock-
well
G. M. Mayhew, Hitchin
D. Robertson, Glasgow
C. W. Rogers, Putney
M. Shewin, London

The Final and Special.

The Final and Special Examination, qualifying for candidature as Associate R.L.B.A., was held in London from June 20 to 28. Of the 118 candidates examined, 46 passed, and the remaining 72 were relegated in various subjects. The passed candidates are as follows:—

A. G. W. Allen, Round-
hay
H. J. Arden, Hornsey
T. J. Banson, Wake-
field
F. R. Barry, jun.,
Richmond
T. P. Bennett, Kilburn
S. R. Bhegwar, London
A. Booth, Barnsey
G. B. Bradman, Khar-
town
H. J. Brownlee, London
J. A. Cheston, Sutton
A. Cooper, Slough
K. Dalgleish, London
C. G. Evans, Neath
O. Gaunt, Hitchin
T. G. Gilmour, Glas-
gow
H. Goldstraw, Hanley
J. W. Green, Sheffield
J. C. Harvey, North-
ampton
P. E. Holland, Bexley
E. H. Honeyburne,
Southport
R. J. Hughes, Llanfair-
fechan
T. F. Ingram, London
J. W. Kay, Edinburgh
J. R. Maughan, New-
castle-on-Tyne
P. W. Moore, Keighley
R. G. Muir, Gerrards
Cross

The following table shows the number of failures in each subject of the Final Examination:—

I. Design	53
II. The Principles of Architecture	20
III. Building Materials	19
IV. Principles of Hygiene	39
V. Specifications	27
VI. Construction — Foundations,	39
VII. Construction—Iron and Steel	54
etc.	

The Hon. Examiners, June Examinations, 1912.

PRELIMINARY EXAMINATION.
VII. Freehand Drawing: Mr. H. P. Burke Downing.

INTERMEDIATE EXAMINATION.
I. Classic Architecture: Messrs. Arthur E. Henderson and John A. Marshall.
II. Renaissance Architecture: Messrs. C. Wontner Smith and P. Leslie Waterhouse.
III. Renaissance Architecture: Messrs. Henry Tanner, jun., and Arthur T. Bolton.

IV. General History of Architecture: Messrs. W. A. Forsyth and D. T. Frye.
V. Theoretical Construction: Messrs. Garbutt and H. A. Newton.
VI. Descriptive Geometry: Messrs. Barrow and Alan E. Munby.
VII. Applied Construction: Messrs. Ashbridge and W. R. Davidge.

FINAL AND SPECIAL EXAMINATIONS.

I. Design: Messrs. Harry Redfern and Rickards.
II. Principles of Architecture: Messrs. Spooner, C. Harrison Townsend, and Troup.
III. Properties of Building Materials: Messrs. H. D. Seales-Wood and A. H. Kersey.
IV. Arrangement of Buildings in Relation to Health: Messrs. Albert W. Moore and White.
V. Specifications and Estimating: Messrs. Matt. Garbutt and Edward Greenop.
VI. Construction—Foundations: Messrs. Corcor and W. E. Vernon Crompton.
VII. Construction in Iron and Steel: Messrs. Arthur Ashbridge, Bernard Dickes, and L. Solomon.

The Final Examination: Problems in Design.

The Board of Architectural Education approved the designs submitted by the mentioned below who are qualifying for the Final Examination:—

Subject I. (b).—A Terrace of Five Houses.
Mr. K. Glover.

Subject II. (a).—A Monument to an Architect.
Mr. K. Glover.

Subject III. (a).—A Detached House for a large Country House. —Messrs. F. E. H. C. Bradshaw, R. S. Dixon, H. A. Gee, T. C. Lawrence, R. A. Barber.

Subject III. (b).—A Landing Stage on a Lake, with a Restaurant. —Mr. Liddetter, E. Prestwich, W. H. T. R. W. Walter, W. E. Woodin.

The designs of Messrs. K. Glover, Charleswood, and C. J. K. Clark in Su-
have also been approved.

Newly-elected Licentiate.

At the Council Meeting of June 1910, the following candidates were elected L.R.B.A. in accordance with the provisions of By-law 12:—

W. J. Abra, Ottawa, H. A. Coldman
F. B. Adams, W. G. Wellington
D. L. Allan, Dundee, W. V. Cook
J. A. O. Allan, Aber-
deen, S. N. Cooke
E. G. Allen, C. J. Corbett
F. R. G. Badger, Liver-
pool, J. H. Cosser
A. A. Cowan, N. A. Cowan
J. J. Baigent, B. Cratney
W. Baillie, Glasgow, on-Tyne
H. G. Baker, Aldershot
W. Barclay, Glasgow, on-Tyne
E. G. Barker, Liverpool
F. M. Barker, Van-
couver, B.C.
W. H. Barton, izes
D. W. Baxter, Dundee
W. A. Baynes, Hanley
A. Belcher, F. J. Daniel
G. Bell, Newcastle-on-
Tyne, T. B. Dams-
ton, Canada
A. N. Bembridge, J. Davidson
D. B. Bethell, C. F. Dawson
W. M. Bishop, Mother-
well, J. Day, Wake-
field, H. A. C. Deek
A. B. Black, Adelaide, A. Dicken
W. A. Blackett, Mel-
bourne, H. A. Dyer
W. Blackshaw, Stock-
port, E. W. Drson
L. M. W. Bladen, Gold-
Coast, F. R. L.
H. D. Blessley, Cardiff, Manchester
J. P. Bond, Norwich, J. P. Edwards
M. Botting, Blackhill, Birm-
ingham
F. R. Bradford, ham
E. H. Bray, Evans
O. A. Bridges, Bognor
W. F. Bright, L. Falconer
C. E. Brooks, Brisbane

ARCHITECTURAL SOCIETIES.

The Architectural Association.

The forty-third annual excursion of the Architectural Association will take place in the neighbourhood of Shrewsbury in the week August 12 to 17. The party will visit—on Monday: Allbrigh House, Grinshill, Preston Brookhurst, Moreton Corbet, Batfield Church; on Tuesday, Worcester Church, Shipton Hall, Wilderhope, Broncroft Castle, Church Stretton; on Wednesday, Madeley Court, Shifnal Church, Tong Church and Castle; on Thursday, Stokesay, Ludlow, Ludford; on Friday, Plais Hall, Preen Manor and Church, Langley, and Pitchford.

ARCHÆOLOGICAL SOCIETIES.

Surrey Archaeological Society.

As announced in the *Builder* of the 12th ult., the annual excursion of this Society took place on Thursday, July 18. The rendezvous was Chertsey, where the members and their friends—numbering upwards of 170 persons—were met by Mr. Philip M. Johnston, F.S.A. In describing the venerable church, Mr. Johnston said it was originally dedicated to All Saints, but afterwards to S. Peter. This was a link with the remote past when Christianity first became known to the Pagan Saxons of Wessex. In A.D. 666 Erkenwald founded a monastery on a site near the present Chertsey Bridge, and from that centre evangelised the north-west parts of Surrey. In the Norman period a magnificent abbey was built on the banks of the river. The church dated from the early part of the XIIIth century, when a rude stone structure apparently replaced one of timber, which was erected in the XIth century. It was rebuilt, as far as the body was concerned, in 1808. The western tower was much patched; the chancel had some very interesting features, dating mainly from 1340.

Passing from the church, the party proceeded to the Abbeymeads, where Mr. H. E. Malden, M.A., described the remains as shown in the old wall and adjacent barn. He said that in the adjoining meadows there were the traces of certain foundations, but the two comparatively small pieces of wall were the principal parts of the abbey which remained, while the granary wall adjacent appeared also to have belonged to the abbey. Mr. Malden said that not only had the abbey gone, but that a house, which was erected from the materials, had also disappeared.

The famous abbey fishponds were next inspected by kind permission of Mr. G. Boyce, J.P., the owner. He said there were other fishponds, but he asked them to note the one they were inspecting, as it was the only one which still retained its original form. A sluice gate could be raised and the pond drained dry, so that the fish could be obtained at any time.

Mr. Malden, who showed a charter of the town and a plan of the abbey site, which had been left for the inspection of the members, said that there had been a large system of ponds, with a moat around them and intersecting water-

courses. The pond referred to by Mr. Boyce was made by Abbott Rutherford, and was practically as he left it, except that the alders which grew there were not to be seen now. Water was supplied by means of a sluice in the moat, by working which, too, the pond could be lowered.

Many ancient tiles have been found at Chertsey, but the best ornamental ones, illustrating incidents in the life of King Mark King of Cornwall, are now deposited in the Royal Architectural Museum at Tufon-street, Westminster.

The party next visited Thorpe, where they assembled in the church, and Mr. P. M. Johnston gave a description of the edifice. He said it was situated in a picturesque neighbourhood, and the whole parish abounded in domestic antiquities, humble, of course, but all having great interest to them as Surrey archaeologists. He deplored the unchecked growth of ivy over the church. The damage it did was inevitable, and they could view with nothing but concern the stout stems that had a very strong hold upon the buttresses of the tower. Mr. Johnston remarked that although there was a good deal of modern work there was also in the chancel arch an undoubted relic of the Norman period. There were also elaborate chancel squints, no doubt introduced about the XVth century, and unique in Surrey. They were introduced no doubt to give a clearer view of the sacred mysteries performed at the altar, and Thorpe was to be congratulated on their preservation. As in the case of Chertsey, the interesting XIVth-century canopy over the rood had hitherto escaped notices in the various records. It was more interesting because they had a parallel instance at Pyrford.

The journey was then resumed towards "Great Posters," a Tudor mansion on the Strand-road, and close to the well-known London Stone. Here, by the kindness of the Right Hon. Lord Dudley, the party were permitted to perambulate through all the apartments of the house, which, being empty and under repair, was easier to examine. Mr. Ralph Neville, F.S.A., architect, said this house was an important one, and the occasion from an archaeological point of view was equally important inasmuch as it had not hitherto been open for inspection. There was not a single word about it in any of the county histories. It dated from the latter days of Queen Elizabeth or the early days of King James I., and was further interesting as the birthplace of the late Dr. Furnivall, the Shakespearian scholar. Mr. Nevill, then described the building, and Mr. Frederick Turner, of Egham, read a paper on the history of the building. Milton Park, the residence of Baron de Worms, F.S.A., was next visited. Here the party were invited to inspect some curious stone doorways in the garden.

NEW SCIENCE SCHOOLS, BLUNDELL'S SCHOOL, TIVERTON.

At Blundell's School, Tiverton, on July 27, Mr. John Coles formally opened the new science buildings. This additional block of buildings has been built by the governors of the School from the designs of Sir Ernest George, A.R.A., and Mr. Alfred B. Yeates. It comprises a laboratory and three lecture-rooms, also a small museum and balance-room.

New Science Block, Blundell's School, Devon : Plan.

The design is the traditional Tudor architecture of the old Blundell's School, founded by Sir Peter Blundell in 1604, the local stone being used for the walling, with Douling stone dressings. The roof, like the remainder of the School buildings, is of grey Cornish slates. The interior walls are lined with white

Blundell's School, Tiverton, Devon: New Science Block.

Messrs. Ernest George & Yeates, Architects.

glazed bricks. The floors are constructed of hollow bricks reinforced with steel rods, and are finished with maple wood blocks or Terrazzo marble.

The chemical fittings have been ably arranged by Mr. Pidge, one of the resident masters. The woodwork is of teak, with apparatus of the most recent design.

The contractors were Messrs. J. Grater & Son, of Tiverton, and Mr. R. Bathgate, the resident clerk of works, superintended the erection of the building.

THE NATIONAL COMPETITION, 1912.

ONE wonders, after visiting such an exhibition, what will happen to the young artists when they leave the shelter of studenthood—that small kingdom of generous enthusiasm and high ideals. For here, certainly, is the work of artists—artists chiefly in little things, precious ornaments, and jewels with which to bedeck beauty, stained glass and textiles, and book-binding. In many ways the work of the young men and women who study the applied arts gives one *furieuxment à penser*. The passing of *l'art nouveau* has sent the designers back to traditional motifs, experience has given the hand the cunning of a good workman, and the result is some delightful work. But why is this material not organised? It seems such a pity that all this talent should be neglected, should become asphyxiated for want of a proper air to nourish it. All the prizes of the world go to those who practise the arts of painting, sculpture, and architecture; they enjoy a certain reputation, they have a social position, they have a goal, an *Ultima Thule*, in the Royal Academy. So the majority of those who are inclined at all to art choose what they imagine to be a path through life strewn with flowers. Now, with some encouragement, the craftsman would flourish again. As students the few who adopt the less showy way undoubtedly do. But what happens when they become workmen? On the whole, the most entrancing work in the Exhibition is the jewellery and metalwork. It is, at any rate, infinitely superior to anything one sees in shops.

There are two really splendid necklets, the various parts of which, though small, are well

conceived, and the whole are daintily executed by Miss Madeline Hutchins, and Mr. Bernard Instone. These both gained silver medals. Another scarcely less beautiful, by Miss Edith Tasker, was awarded a bronze medal. A gold medal was given for an enamelled silver cloak clasp to Miss Dorothy V. C. Munro for its beauty of design and fine workmanship. A copper cup decorated with silver and enamel, by Miss Amy Upson, and a little silver horn, by Miss Selina L. Scott, are as fine as old things. They are excellently made, and quaintly conceived as to design. These are a few of the really delightful things shown which make one realise the talent there is for this kind of work scattered up and down the country.

None of the furniture or woodcarving is good. It all lacks suavity of design and looks common. There are a few pieces of stained glass, all of which are only fairly good, but they are all above the level of the usual stained glass one finds in churches. So with the bookbinding, which is good, but without anything of outstanding merit. Fine lettering has, to some extent, been taken over by advertising firms, so that there is at least a market for this form of craftsmanship. Perhaps the best example is a small slate tablet with a short inscription; it is legible to those who run, and is beautifully designed. It is the work of Mr. George R. W. Starkey, and is equal to any old inscription. Miss Ethel C. Liggins has done "Te Deum" in gilded letters upon paper or parchment with great reserve and dignity. And there are several quite noble pages of lettering in the Exhibition. Again, there are designs for chintzes that make one long to see them printed, and some fine designs for modern costumes by Miss Helen S. Oliver. Nothing seems to be too small to be the object of loving care; witness a design in needle-point lace of a child's shoe, by Miss Florence A. Davy, for which a gold medal has been given.

A bronze medal has been awarded to Mr. Stuart Earl for his design for an iron grille. In actual workmanship it leaves nothing to be desired, the wrought foliage and groups of flowers being splendidly made. The foliage, instead of being in *repoussé*, is beaten out of the heavy iron, and certainly looks very well, although it must have entailed much additional work. As one walks round the Exhibition one

is struck by the beauty of much of quite impossible to pick out everything from the mere number of exhibits. The outlook for the arts and applied arts is hopeful. When the public awakens to the fact that art is an integral part of life, the artists are ready. The painting and the sculpture from the life shows nothing of great although a fairly high standard of work prevails. The painting from still life is interesting, and one or two good ones are the result, but in no case has the attempt to paint light been quite successful. A painting in monochrome a silver vase has been awarded to Miss Annie Watson for a splendid rendering of an egg and a vase ornament. It is drawn with extreme care and painted with a fine appreciation of values. Indeed when one considers a dreary waste of energy it seems fatuous painting and modelling from nature and *Antique*—the same yesterday and apparently for ever! The sculpture is uninspired work, uninformed by a sense of grace or beauty. New methods of work need to be inaugurated to take the place of the slough of despond into which the architecture is poor, or two exceptions. Mr. Stanley design for a central courtyard of Exchange is conceived on broad lines, and a large and dignified scale is throughout. The ballroom and ball hall by Mr. J. Lewson, is also good, but carefully considered with regard to proportion as the former. There is also a fine measured drawing of St. Mary's Church, Astbury, Cheshire, a beautiful late building.

The Exhibition, as a whole, presents points of interest, and is well worth a visit to those who are interested in the future of the arts and the applied arts. But one is driven to the conclusion that many of the students of the former would be better in the latter. This is no disparagement; doubtless it will be conceded that it is to make a beautiful box or a piece of metalwork than a beautiful picture or statue or a detail of the household beautiful perpetuate a bad picture or statue.

VAL ARCHÆOLOGICAL
E AT NORTHAMPTON.

long interval of thirty-five years is holding its annual meeting this year at Northampton, the headquarters of the county town. The proceedings began on Tuesday, July 23, in the Town Hall, Mayor, Dr. Lee F. Gogan, formally welcomed the members to Northampton, and their visit would be full of interest.

Stockford Sackville, the President of the Society, spoke a few words on behalf of the county. Sir Henry Villiers replied as President of the proceedings ended.

The next made to St. Peter's Church, described by the Vicar, the Rev. Canon. It consists of a chancel and nave, with a north aisle, and a south aisle, a north porch, and a south porch. The east end is a modern addition. The nave and clearstory date from the third quarter of the 13th century, and are characterised by the richness and excellence of the carved work. The aisles were rebuilt on the old foundations in the 14th century, but the windows date from the reign of Edward I. The tower was carefully rebuilt, and to a large extent with the old materials. The only ancient furniture is the 14th-century work.

St. John Hope pointed out the position of the pillars of the nave arcade and compound piers, and suggested shafts on the fronts of the former, carried up to the wall plate of the nave roof, were indicative of an outstanding the thinness of the walls to cover the nave with a barrel vault, a suggestion which was supported by the fact that the compound piers in similar shafts that had once carried arches to counteract the thrust of the vault.

When the party reassembled in the Church, which was also described by Mr. M. Serjeantson. It was, as he pointed out, as being one of the two churches (the other being at Cambridge), the circular nave and aisle, to which they had been attached a chancel of three bays apparently in an apse. This had been given in 1116 to the Cluniac monks of Northampton, and therefore before the foundation of the Order of the Temple into a north aisle had been added to the church in 1170 as a chapel in honour of St. Mary. A second north aisle was added in the 14th century. The south porch was taken down, a new south porch and the present western tower added. The church was considerably enlarged by the new chancel with aisles in 1801-2. It followed with some remarks on the history of the church, which divided themselves into four classes, being the purely parish churches at Northampton and Cambridge; the next, churches at London and others at Dover and Dover, which could be traced to the Templars; a third class of churches built by the Knights of the Order of St. John, as at Clerkenwell and St. Andrew; and a fourth group which included the well-known chapel in

Ludlow Castle and the destroyed *capella rotunda* in King Henry III.'s Manor of Woodstock. Mr. Hope was inclined to regard these round naves as belfries, and instanced that formerly surmounting the nave at St. Sepulchre's at Cambridge and the one still to be seen at Little Maplestead, and he suggested that the building of the western tower in the present instance was due to the threatening collapse and subsequent taking down of the belfry that surmounted the octagonal nave. Sir Henry Hope suggested an analogy between these round churches in England and the circular baptisteries which are so common in Italy.

St. Giles's church, which was next visited, was originally an aisleless cross church with middle tower, of 12th century date, with enlargements and additions of the 13th century, but is not otherwise a building of special interest. The Rev. R. M. Serjeantson pointed out its most noteworthy features, including a tablet on the north wall of the nave recording that

"ROB SEITHORPS CARE
TO GODS TRVE FEARE
THIS DOWNEFALLE
CHURCH GOT
HELPE TO REARE
1616
WILL DAWES MAYOR."

It is a little uncertain what damage was done by the fall here recorded, presumably of the tower.

After tea at the Town Hall by invitation of the Mayor, when the five corporation maces were also exhibited, a journey was made to the famous Eleanor Cross at Hardingstone, which was described by Mr. W. H. St. John Hope.

This cross, he pointed out, was one of a number that had been set up between 1291 and 1293 at certain points on the road between Harby, near Lincoln, where Queen Eleanor, the consort of Edward I., had died in November, 1290, and the abbey church of Westminster, where eventually she was buried. A cross, built by John of Stowe, was set up at Lincoln, where the Queen's bowels were buried in the Minster, and another, of special magnificence, at Charing, within sight of Westminster. A third was also set up in Cheap, in the City of London, presumably to mark a station of the Queen's body in St. Paul's. A fourth cross was set up at Waltham, which still remains, and the Northampton cross was one of a group, the others being at St. Albans, Dunstable, Stony Stratford, and Woburn, which were contracted for by John of Battle. Of this group the Northampton cross seems to be the only one that was finished, and Mr. Hope thought that the disappearance of the other four was due, not to a later destruction, but to their removal on account of their incomplete state. The four images of the Queen on the Northampton cross were the work of Master William of Ireland, who also worked upon the shaft and cross (now gone) of Purbeck marble supplied by Robert of Corfe. The images and cross were wrought in London and brought down to Northampton by William of Barnack, mason. Mr. Hope referred to the difficulty of separating from the entries given in the Queen's executors' accounts the cost of each cross, but the group contracted for by John of Battle seem to have cost about the same as the Waltham cross, namely, about 95*l*. each. The Lincoln cross apparently cost 124*l*., the Cheap cross (which was contracted for by Master Michael of Canterbury) 300*l*., and the Charing cross nearly 800*l*.! The accounts do not mention any other crosses. The Northampton cross underwent

more than one "restoration" in the 19th century, but still retains, and in wonderful condition, part of the work of Master John of Battle and of Master William of Ireland.

At the evening meeting a paper was read by the Rev. R. M. Serjeantson on the history of Northampton.

Wednesday, the 24th, was devoted to excursions to Boughton House, Geddington, Rushton, and Rothwell.

Boughton House was described by Mr. J. A. Gutch, who acted as guide, as an extremely interesting example of a house of a great noble of the time of William and Mary, which retains much of the furniture and painted and other decorations of the period. The old house at Boughton was built about 1640 by Sir Edward Montagu, Lord Chief Justice, and added to by his successors. But about 1700 the house was largely reconstructed and rebuilt by Ralph, first Duke of Montagu, who had been Ambassador at the Court of Versailles, and became imbued with ideas of imitating that great palace in his own new home. The front of the house, with its projecting wings, is entirely his, and of two stories, with characteristic dormer windows in the roof. But behind this, and enclosed by more of the Duke's work along the west front, are incorporated the remains of the older house. Of the unusually large and elaborate lay-out, of which there is ample record, but little is now left.

From Boughton House the journey was continued to Geddington, where there is at the entrance of the village a good 14th-century bridge, with the usual cutwaters on the upper side (p. 135) and, just beyond it, the Eleanor Cross. The church, which stands a little farther on to the east, is an interesting structure, which was described by Mr. A. Hamilton Thompson.

The nave walls have later arches pierced through them, and are surmounted by a 14th-century clearstory, but are otherwise of pre-Conquest date, with curious triangular-headed wall arcades on their outer faces, now visible under the aisle roofs. A north aisle, overlapping the chancel, was added in the 12th century, but rebuilt later, and in the 13th century a south aisle was added and the chancel reconstructed with a large chapel to the south. Further alterations to the chancel were made in the 14th century, to which date belong the fine tower and spire. The church contains a remarkable late 13th-century wooden screen, originally across the south aisle, but now placed under an arch of the chancel, while its place is occupied by an equally curious screen of pre-1618 that down to a recent restoration filled the upper part of the old chancel arch, which was then raised and filled with a new screen. The 14th-century reredos of the high altar, with one large and twelve smaller niches for images, remains, and along the base of the walls of the presbytery is a slightly projecting ledge with the inscription:—WILLELMVS GLOVERE DE GATTYNGTON CAPPELLANVS FECIT SCABELLA DEVS ARE ET PAVIMENTARE ISTVM CANCELLVM AD HONOREM DEI ET BEATE MARIE QVI ORIT IN FESTO CORPORIS CHRISTI ANNO DOMINI M CCC LXIX CIVIS ANIME PROPICIETVR DEVS AMEN. A similar inscription runs along the altar step of the south chapel:—ROBERTVS LAVNCELYN DE GATTYNGTON FECIT ISTVM CANCELLVM CIVIS ANIME PROPICIETVR DEVS AMEN.

The well-known cross which stands in the middle of the village was described by Mr. Hope, who called attention to the beautiful diaper work on the three-sided base and the veiled images of Queen Eleanor in the upper stage, in contrast to the images with flowing

Geddington Bridge.

Kirby Hall.

hair on the Northampton cross. Although obviously a memorial to the Queen, as shown by the heraldry and imagery, there is no record of its construction, nor any other evidence that Geddington was one of the stations where the Queen's corpse rested. No other cross, moreover, is known certainly to have existed between here and Lincoln, and Mr. Hope much doubted whether any had ever been erected. It was singular, too, that a cross differing so markedly from what is known of the rest should have been set up at Geddington.

After luncheon at Kettering, the church of which town has one of the finest towers and spires in Northants, the journey was continued to Rushton Church, which was described by Mr. Hamilton Thompson. It is architecturally of little interest, but has on the south of the chancel a small added vestry of the XIIIth century with a stone roof and three elaborately canopied sedilia. In the north chapel is a fine XIIIth-century effigy of a cross-legged knight in mail sheathing his sword, of Purbeck marble, and the alabaster tomb and effigy of Sir Thomas Tresham, last prior of the Order of St. John of Jerusalem in England, who is shown in armour, and over it a long gown charged on the breast with the cross fleury of the Order.

Rushton Hall was next visited and described by Mr. Gotech, who pointed out the remains of the hall, etc. of an earlier house, built by a John Tresham about 1500, but added to by his great-grandson, Sir Thomas Tresham, in 1595. In 1619 the estate was sold to Sir William Cockayne, who made further additions, and converted the house into one forming three sides of a rectangular court, with the corridor closing in the fourth side. The exterior of the house is extremely picturesque with its many gables and oriels, but the interior has lately been partly gutted by fire, and contains few ancient features; the south face is also entirely modern. A curious representation in plaster of the Crucifixion in a small oratory upstairs deserves notice.

A short distance from the house, in a secluded corner of the grounds, stands the remarkable triangular lodge built by Sir Thomas Tresham in 1593-5, which was also described by Mr. Gotech. It is three stories high, with three niches in each side on every floor, and three gables above; the chimney-stack is also three-sided. The building now stands in a clearing which might with advantage be enlarged so as to show more of it, but the structure itself can only be regarded as a freak, and though it retains all its floors and roof it could hardly be made into a habitable dwelling.

The journey was next continued to the village of Rushston, where the market house was first inspected. This was shown by Mr. Gotech to be another of Sir Thomas Tresham's works, of a date about 1570. It is practically cruciform in plan, with a vice in one angle, and was planned to form an open market space below with a chamber above. The exterior is decorated with heraldry and characteristic inscriptions. The building seems not to have been finished until it was roofed in and otherwise converted into offices for the District Council and a free library in 1895. The work of conversion has been carefully carried out by Mr. Gotech, and has ensured the preservation of what was till lately a roofless ruin.

Rothwell Church was also inspected and described by Mr. Thompson. It is a very puzzling building, and apparently began as a cruciform XIth-century church, with a tower over the crossing and arcades opening into the nave aisles. The chancel was much altered, and aisles added to it, in the XIIth century. The middle tower was taken down and a new tower and spire built at the west end. The arcades of the nave were also raised and the pillars doubled in height and various other changes effected in the plan of the building. The church contains some good brasses and other features of interest, including some of the chancel stallwork with misericordes, and under the south aisle of the nave is a large bone-hole, containing bones found in digging graves, and here stored, as usual, below an altar.

The return journey was afterwards made to Northampton, where at the evening meeting Mr. Hamilton Thompson read a paper on "Church Architecture in Northamptonshire," with lantern illustrations.

The first building visited on Thursday, the 25th, was the charming old bed-house at Liddington, founded as such by Thomas, first Earl of Exeter (ob. 1622). It was, however, as pointed out by Mr. Hamilton Thompson, originally a manor-house of the Bishops of

Lincoln, and Bishop Burghersh had licence in 1331 to enlarge and wall his park here, and in 1336 licence to crenellate or fortify his house. The existing building seems to have been built by Bishop Russell (1480-94) as a hall with great chamber and other lodgings, all on the first floor, as was usual, with kitchen and offices below. To Bishop Smith (1496-1514) is due the fine wooden ceiling to the hall, as well as the lodgings in its roof, and other minor changes. Little harm has been done to the building by its conversion into a bed-house, and at the back the lower openings are covered by a pentice, which may be of the XVth century.

Liddington Church, which was next visited under Mr. Thompson's guidance, is a good example of a Northamptonshire church, with a good rood screen retaining much of its old colouring. The chief feature is, however, the arrangement of the altar, which stands within a quadrangular railed enclosure, Puritan fashion, of the date 1635. Very few such examples, unfortunately, now remain. Mr. Hope called attention to the low side window, with its rebate for a wooden shutter, and cited a number of examples at Ely (in Prior Crauden's chapel), Caerphilly Castle, Little Wenham, and Leeds Castle, all on upper floors, and in the last-named example looking out over a most full of water, as proofs of the absurdity of the confessional theory, which has lately been urged with much persistence in certain quarters, and of the equally ridiculous "leper" theory. The concurrence of opinion at present was all in favour of such openings having been made to ring the sacring bell at, to remind those who were without of the moment of the elevation of the Blessed Sacrament.

Kirby Hall was the next objective, and its beautiful remains were rightly described by Mr. Gotech as the romantic ruins of one of the most beautiful of Elizabethan houses. The house is disposed about the sides of an irregular quadrangular court, planned by John Thorpe, who laid the first stone in 1570. The building was erected for Sir Humphrey Stafford, of Blatherwyke, and finished about 1575. Sir Humphrey died almost directly afterwards, and the house was then bought by Sir Christopher Hatton, who made some additions to it. It finally assumed its present form about 1638-40, when certain changes were made in the north end of the court and elsewhere, under the direction, possibly, of Inigo Jones. The admirable detail of both the XVth and the XVIIth century work is of unusual interest. The house was occupied down to the thirties of the last century, when it was dismantled to pay the racing debts of the owner, and is now, with the exception of the great hall, which retains its beautiful ceiling, and part of the south-west wing (p. 135), a hopeless ruin. It is much to be hoped that arrangements may be made for bringing this magnificent structure within the scope of the Ancient Monuments Act. Mr. Hope called attention to the heraldic beasts, examples of which still surmounted some of the pinnacles and gables, and showed that a continuous series had once existed about the great court. He also pointed to the free treatment of heraldry as a decoration in other parts of the building.

After luncheon in the great hall the journey was resumed to Rockingham Castle, where the party was received by the Rev. and Mrs. Wentworth Watson. Mr. Hamilton Thompson described the castle, and quoted the evidence of the Domesday Book in proof of its foundation by William the Conqueror, on land that had been waste, as a fortress of the well-known mount-and-bailey type. Part of the mount may still be traced, but the rest was overthrown during the Civil War, and the other earthworks obliterated through the substitution of masonry defences for the first timber palisading. The masonry defences, which include the present gate-house, the east curtain wall, and the shell of the great hall, belong to the end of the XIIIth century, when much rebuilding was done under King Edward I. Important changes were made in 1585 and in 1690 which have converted the mediæval buildings into a comfortable residence. Mr. Hope referred to the Domesday entry as proving that the Castle was then a new one, and claimed that it had originally included a large outer bailey to the south. This would have placed the Castle among those of the first rank in point of size, but by the time that it was decided to substitute walls of masonry for the timber defences the original purpose of the fortress, as one of the great series planted all over England by the Conqueror to hold down a hostile population,

had passed away, and it was possible the outer bailey and forty only tower and inner bailey.

The party afterwards returned to Northampton, where, at the evening meeting, with lantern illustrations, was read by Mr. Reginald Smith on the famous finds from Hunsbury Hill, near Northampton Museum.

(To be continued.)

THE ROYAL SANITARY INSTITUTE: YORK CONGRESS.

THE Congress of the Royal Sanitary was this year held at York, where there was very large attendance of delegates, representatives from Japan, the Commonwealth of Australia, Victoria, Queensland, Australia, Tasmania, the Admiralty, Council, H.M. Office of Works, the Sanitarians in Lunacy, the Royal Institute of Architects, the Architectural Association, the Concrete Institute, the Sanitary Institute of London, the Institution of Civil Engineers, the Institution of Municipal Engineers, the Institution of Municipal Engineers, the Institution of Water Engineers, Royal Institute of Engineers, the Rural Housing Association, Sanitary Inspection Association, Society of Architects, Sanitary Engineers, Surveyors' Institution, and a number of the chief municipal bodies of Britain and Ireland.

On Monday the Congress was inaugurated by a luncheon at the Guildhall, presided over by the Lord Mayor of York. The Archibishop of York proposed the toast of the Royal Sanitary Institute, and said it was twenty-six years since the Institute had visited York. The Institute was engaged in work which, if continued, it almost certain that they might at the time when all the ranges of public disease would have been removed from the lives of the people. Public opinion stimulated by the Institute, which has 9,727 certificates to persons who have knowledge of the conditions which the combat, and whose work had caused vision of ample light and air, pure water and dwellings.

The toast was acknowledged by the Lord Mayor.

Colonel Lane-Nottor subsequently proposed the toast of "The Lord Mayor and the City of York."

President's Address.

On Monday night, in the Festival Hall, the Archbishop of York delivered his Presidential Address, in the course of which he said that his election as President was regarded as the visible symbol of that close relationship between body and soul, between spiritual and physical environment, which science has demonstrated, and which religion, he hoped, would learn to accept. At the outset he expressed in the name of the whole Congress their deep and infinite satisfaction in progress which had been made by science during the last forty years. Times when they turned with wistful eyes to other ages in the history of their country, when they knew, of course, that golden age never existed, and if it did, wise they would always believe that it was in the times which they lived were the best time in which they lived were the best time in. In spite of that, however, the themselves looking back somewhat to the Middle Ages of English life, seemed to see in them traces of a more and merry England than they could at the present time. If, however, their history they found that if mediæval was beautiful it was also plague-ridden. Certainly, if they went through the streets of York and examined the buildings there, never doubt that in times past it must have been a place extraordinarily picturesque, full of many indications of a width of vision and skill of craftsmanship which much wished they could reproduce, but the Middle Ages they had the ravages of black death, malignant fevers, and blights which devastated the population. Gently and steadily, sanitary reforms entered the city, but he supposed that it was not until 1830, when the great sewage scheme was in hand, that the tide began to turn. The result was that, mainly through sanitary

chairman, in opening the meeting, his position and character of sanitary practice in the light of present-day

From the point of view of a local authority (which includes the departments of the Medical Officer of Health and the Surveyor, as well as that of the ratepayer) town planning is in theory the only thing: there is no alternative.

Finally, it must be remembered that the dreams of the idealist must be transmuted by

the alchemy of common sense into something practical before they can serve as a basis for town planning and the laying-out of garden cities.

Mr. F. W. Spurr (City Engineer, York) communicated some notes on the paper, and said he felt sure that economies could be brought about in street construction varying in amount with the particular form of construction now adopted. In York the method of private street construction consisted of laying the footways with 3-in. Yorkshire flags, 12-in. by 8-in. kerb, and paved channels 14 in. wide, whilst the carriageway was constructed of either 9-in. stone pitching or 6-in. concrete finished with 3-in. tar macadam the full width between channels. By adopting the following method of construction a saving of about 30 per cent. could be made, and the Corporation had agreed to the amended method of construction, provided the width of the street was not less than 42 ft., and the distance between the houses themselves 62 ft.—Footways constructed of tar paving composed of limestone chippings in place of 3-in. Yorkshire flags, 10-in. by 3-in. kerb in place of 12-in. by 8-in., and channels 8 in. wide instead of 14 in. With regard to the carriageways in residential streets, he did not advocate any alteration in the form of construction beyond reducing their width to about 16 ft., the remaining width being grassed and planted. With regard to economies in cottage construction, he did not think much could be done unless some other form of construction was adopted, but there could be no doubt that to build at the least possible cost cottages must be erected in blocks of not less than six. Some saving in cost could be effected where by-laws provided for carrying the party walls through the roof, a precaution which he thought was unnecessary, and something might also be saved by an alteration in the thickness of walls of two-story cottages.

Mr. Moulding (Exeter) said he agreed with the suggestions of Mr. Spurr, and he further agreed that all these things must be considered in relation to the different towns they were dealing with. In Exeter the standard of streets was much lower than in York. In certain streets where there was not much traffic they allowed a gravel footpath, and they used granite chips because they got them cheaply. They were well rolled in and tar-painted, and they lasted a considerable time. In the carriageway it would be a good thing if they could get landowners to put 6 in. of concrete, having regard to future upkeep; but it was rather a big thing to ask the owner to do. He thought that the cost of houses could be cheapened if the outbuildings could be built as suggested by the author, and in Exeter the by-laws in that respect were modified.

Mr. Matthews (Bridlington) said his district was a residential one, and he had been trying to imagine as he sat there how very much it differed from a manufacturing city, where the town-planning area was purely an industrial one. It was incumbent on them as surveyors to make the best they could of the district each had to deal with, and not to be influenced to too great an extent by what was being done in other towns. He did not quite agree that a house occupied by two or three families would become a slum. At Doncaster recently they submitted a housing scheme to the Local Government Board, and at the local inquiry it appeared that the tenants for whom the houses were intended had been accustomed to pay rents of 3s. or 3s. 6d. a week. The charge for the new houses would be 6s. a week, and the inspector said he could not approve of that, and that fresh plans must be drawn up for houses to be let in tenements to two families at rents of 3s. a week. He saw no reason why a person inhabiting half a house should not be inclined to keep it in a sanitary condition as if he occupied a whole house. He also saw no reason why a road on which there was to be no heavy traffic should not be less than the ordinary road in width, and in Bridlington they allowed a width of 30 ft. for such roads.

Mr. Munce (Belfast) pointed out the difference in the practice at Belfast with regard to the terms for letting land for building purposes. The land on which his own house was built was on a lease of 9,999 years less one day. A man bought land and laid it out, and leased the land at a rent varying from 3s. to 4s. a foot frontage to the street, and as the houses were from about 13 ft. frontage the ground rent would run from 39s. to 52s. per annum. When the land was covered with houses the ground rents were sold at from fourteen or fifteen to as many as twenty

years' purchase. He rather deprecated grass plots along a street, for the constant playing by children on them soon destroyed them. He would prefer that awkward corners and so on should be laid out for play. The longer he lived the more he was convinced that the best thing to do was to spread a town out and bring the people into the centre to the factories and works by tramcars, even if they ran the tramways free.

Mr. Cass (Farnham) considered there were many illusions with regard to housing, and one of these was that houses should always face a street. He saw no necessity for every house and cottage to face a street, which resulted in houses being placed back to back, and also enormously increased the cost of roads. He had now in his mind a plan of laying-out twenty houses on 2 acres, and he found by making a little square the cost would be greatly reduced. He agreed that carriageways should be made fairly strong, but there was often a great waste in the kerbs. In suburban districts where nothing heavier than a furniture-van went down they found 10 by 12 kerbs, and from both the engineering and aesthetic point of view this was absurd.

Mr. Munce said he would like to add that in his view 150l. for a working-class house was absurd. They could build a first-class house for 100l. if they went the right way about it.

Mr. Whyatt, in reply, said they might build for 100l. in Ireland, but not in England. A house with two rooms up and two rooms down could not be built much under 140l. in England, and if they had three rooms upstairs, as was certainly necessary, the cost would be 165l. or 170l. Personally, he was inclined to think that the 3-ft. strip between the road paving and the footway was a mistake, as coal and milk carts would get on to it, and in the course of a few years they would get a nuisance to everybody. He agreed with Mr. Cass that it was not necessary for every cottage to face a street, but the point was that, if they were going to build them in pairs or singly, the cost of the gable walls and the extra fencing had to be added on, and the capital cost was increased. It was true that in theory two or three families in a house need not make it a slum, but in practice it generally did become a slum.

Sewage Disposal in Rural Districts.

Mr. Asenough Rodwell (Engineer and Surveyor Skipton Rural Council) submitted a paper on the above subject, and described what was done in the case of a district with which he had acquaintance. He contended that there ought not to be the same rigid requirements as to the standard of purity of the effluent from small rural villages (where the quantity of sewage effluent is, comparatively speaking, "a mere drop in the bucket") as is necessary for towns where the quantity discharged into the stream is much greater. When, however, the effluent has to be discharged into a small stream (which in summer-time is probably dried up), the standard of purity should, of course, be higher.

The modern methods of dealing with sewage by tanks, bacteria beds, etc., has enabled disposal works to be placed much nearer the houses than was permissible when the method of treatment was by broad irrigation, or even intermittent filtration over land. Also the area of the land required for the works is much smaller. The Council have just recently completed disposal works for two villages, the combined population being over 600. The works consist of sedimentation tanks, percolating filters, storm-water tanks and filters, sludge beds, humus tank, and tool-house, and the whole area, including fence walls, measures less than half an acre.

Mr. F. E. Crutchley (Gloucester) remarked that they were developing a kind of plateau in his district on which a number of villas were being erected, and there were no sewers within a long distance. They were using as far as possible septic tanks. The depth of soil was only 10 in. or 12 in., and then they came to rock. The medical officer did not like to discharge even the effluent into the river, because they did not know what building might take place in the immediate neighbourhood hereafter.

In the absence of the author the paper was not further discussed.

Sewage Treatment.

A long and interesting discussion followed a paper read by Mr. John Manley on "Sewage Treatment: Advantage of Land over Artificial Schemes." As the result of experience and

inquiry, the author strongly advocated a system.

Colonel Jones said that the Army having found out that he was over eight of age, had retired him from the management of the Aldershot Camp Farm. He was advocate of land treatment, but was sure that the land was properly attended to.

Professor Tyndate (Scientific Advisor War Office) referred in high terms to the done by Colonel Jones, and said that the artificial treatment of sewage first of all, and then, before the public, as in all this sort, the public concerned seemed to be heading into the matter, and eventually to be biological treatment just as in any way everything seemed now to be ferocious. He supposed there was no system of sewage treatment with which he was acquainted, and there were, in his thousands of cases where artificial treatment must be adopted. At the same time, he was very glad to say that the sewage had arisen from the wreck, and there were instances where it would still prove the method to deal with sewage.

Mr. Lacey (Oswestry), Mr. Upson (head), Mr. Watson (Birmingham), Mr. Farnham, and Dr. Fowler (Manchester) joined in the discussion, and agreed that where land treatment was possible was effective, although in many cases a system was impossible.

Sludge Problem.

Arising out of a paper by Mr. Arthur and Mr. P. Holt Whitaker, considerable attention took place with regard to the disposal of sludge. At Penrith the authors described a system of sludge treatment. The drying beds are four in number, each 2 by 10 ft. wide by 6 ft. deep; they are composed of brickwork, backed on the outer side with concrete; the floors are made of concrete with proper falls in the direction of the slope. Each bed is provided with doors, consisting of sections, extending the full width of the bed, the lower end, which can be raised or lowered at will as the material in the beds increases. Cross walls are formed of perforated bricks laid in grooves, so as to be easily adjusted. When the sludge is about emptied from the sedimentation tanks of straw, litter, dried weeds, or the like laid in each tank or compartment in such a manner that the whole surface of the tank is covered; the litter is also drawn slightly to the sides of the beds or compartments, and round the vertical, perforated pipes are placed. These perforated, vertical pipes are about 12 in. in diameter, in lengths of about 2 ft., with sockets and spigots so that they can be built up in continuous shafts from the top of the bed as it is being filled. The sludge, to the depth of 4 in. to 6 in. is run on to the litter, which acts as a filter, allowing the liquid to filter through, and find its way to the perforated pipes, turn are connected to drains laid on the surface of the beds. This operation of filling and filtering the sludge is continued until the bed or compartment is full. The operations are transferred to the next bed, and so on, until the sludge has been run to a well, and is then pumped into a channel of the tanks for retreatment. The beds are being filled the increasing amount of sludge and litter, thus after proper settlement, a firm bed of sludge is easily handled and is very strong. A layer of litter is always placed on the surface of the sludge to obviate any nuisance, small which one usually expects to attend open sludge beds or lagoons. The sludge is sold by public tender every year, the price obtained being 1s. 9d. per cart-load. Mr. Cass mentioned that at Farnham, made walls of the ordinary domestic material, which they poured the sludge. The sludge, drained off back into the tank and then refuse made good manure, which was no difficulty in disposing of.

Blackpool Outfall Sewage.

Mr. J. Brodie (Borough Engineer and Surveyor, Blackpool) described the method adopted by him in extending seawards the outfall sewer. The present extension is made by means of a continuous steel tube of internal diameter of solid welded pipes, 18 in. in length, formed of open heart steel riveted together with cover straps 10

thickness, with a double row of $\frac{7}{8}$ -in. rods 3 in. centre to centre. The foundation, which was taken part in by Messrs. (Bridlington), Mr. Whyatt (South), Mr. T. W. Stainthorpe (South), Mr. Brownridge (Birkenhead), and Mr. (fast), to a large extent dealt with the of using steel tubes instead of cast-iron. Mr. Brodie said that the cost was and Mr. Munce endorsed his view experience he had in Belfast that they satisfactory.

UNION BANK OF CANADA, TORONTO.

The home for the Union Bank of Canada, the latest tall buildings in Toronto, has been completed recently. It is located on the corner of King and Bay streets on a lot on King-street, the principal front, on Bay-street. It is a five-story building, covering up to a height of 90 ft. The walls of the building, 6 ft. in height, is of granite from Crotch Island (Maine). The walls are faced with semi-cotta manufactured by the Leeds Company (England). The design is in the manner suitable for the material. The architects are Messrs. Darling & Pearson, Toronto. The construction is of the steel skeleton with reinforced concrete floor slabs and terra-cotta partitions, making the building thoroughly fireproof. The steel frames and sash were manufactured by Henry Hope & Sons, Birmingham. The building is entered through a set of double doors which lead into the entrance hall, 14 ft. The walls of the entrance hall are lined with polished Botticino marble and lead to ceiling. An Otis-Fensom elevator in the basement to the fifth floor, and on staircase with Tennessee marble runs up around the elevator. The entrance hall leads directly into the

banking-room, 33 ft. by 70 ft. and 25 ft. high. Around the walls there is a marble dado 4 ft. high composed of Escalette and Botticino marble. The walls and ceiling are plaster, treated in the French Renaissance style. The walls are jointed up and painted with a water paint to imitate French Caen stone. The ceiling is left in the white. The marble counter is made of Escalette and Botticino marbles, and the floor is of Tennessee light grey marble, with a border of different other kinds of marble. The grills above the counter are cast-iron, bronzed, manufactured by the Ornamental Iron Department of the Canada Foundry Company, Toronto. In a wing carried out at right angles to the banking-room is a battery of vaults used by the bank, and on a mezzanine are located the stenographers, rest-room, and lavatory. The clerks' lavatory and locker-rooms are in the basement. In the basement are also located the stationery and packing rooms, the book vaults, machinery-room, boiler-room, etc.

The bank manager's private office, finished in mahogany, and lavatory are located in the front of the building with an exit into the entrance hall.

Over the manager's office and the entrance hall there is a mezzanine floor comprising a suite of two offices.

The second, third, and fourth floors are subdivided into offices to suit tenants. There is also a battery of five vaults on each floor.

The fifth floor is occupied by the head office of the Union Bank. It is composed of a series of private offices, a board-room, with fumed oak panelling 8 ft. high, a president's office, treated similarly, a spacious general office, two large vaults, men's lavatory, and a separate gallery for the women's lavatory.

Above the fifth floor there is an attic space averaging 6 ft. in height, for the distribution of the low-pressure gravity circulation two-pipe heating system, with wet returns. One large fan exhausts the foul air from the banking-room and a small fan ventilates the lavatories.

The general wood finish throughout the upper floors is fumed oak.

GENERAL NEWS.

The Royal Institute of British Architects: Board of Architectural Education.

The following names are those of candidates for the Final Examination whose designs submitted under the various subjects of the Revised Testimonies of Study have been approved by the Board:—Subject II. (b) Mr. F. Radcliff. Subject III. (a) Mr. F. Radcliff.

The following is a further list of names of candidates for the Final Examination whose designs submitted under the various subjects of the Revised Testimonies of Study have been approved by the Board: Subject III. (a), Mr. E. H. Gibson; Subject III. (a), Mr. Wm. Voelkel; Subject III. (b), Mr. Geo. Crossley.

Candidates who propose applying for admission to the November Final and Special Examination should at once submit, for the approval of the Board of Architectural Education, the subject and titles of their theses. Candidates may select one of the following:—(1) Historical Architecture, implying as far as possible the direct study of actual historical buildings. (2) Science as Applied to Building; by this is intended a special study of an application of science to definite problems of building. (3) Design, including Decoration, such as a study in civic, monumental, decorative, or other branch of architectural design. The subject selected for the thesis is to be notified for the approval of the Board four months before the date of the Examination, and the thesis itself is to be submitted four weeks before the same date. The thesis, which may be either an illustrated essay or a design with a detailed report, will be assessed by examiners specially appointed for the purpose, who will also examine the candidate orally in his thesis. It is open to candidates to obtain distinction in the advanced work, such special distinction to appear in the *Kalendar*.

The Union Bank of Canada, Toronto.
Messrs. Darling & Pearson, Architects.

University of London: University College.

The following awards have been made in the School of Architecture at University College:—The Donaldson Medal to Mr. Oliver Gaunt; the Carpenters' Company Travelling Studentship to Mr. S. Miller; the First Prize in the Advanced Design Class to Mr. W. G. Whincop, and the Second Prize to Mr. H. S. Taylor; the Prize for Measurements and Sketches also to Mr. H. S. Taylor.

In connexion with the arrangements for the Carpenters' Company Classes for next Session, the Classes in Design will be continued on Mondays and Wednesdays, the visitors being Mr. Leonard Stokes and Mr. E. P. Warren. Mr. W. H. Ward, M.A., will give a course of ten public lectures on "Renaissance Architecture in France."

The Institution of Civil Engineers.

Under the will of the late Sir James Inglis, a former President of the Institution of Civil Engineers, the Institution has just received a legacy of 5,000*l.*, to be applied to its new building, which is now in course of erection in Great George-street, Westminster. This legacy testifies to the marked interest which Sir James Inglis took in the scheme for the rebuilding of the Institution, towards the cost of which he had also, during his lifetime, contributed liberally, regarding the occasion as an opportunity to promote the centralisation, and thereby the strength, of civil engineering interests throughout the British Empire.

Northern Polytechnic.

The governors of the Northern Polytechnic have appointed Mr. J. Campbell Reid, A.R.I.B.A., as head of the building trades

department, at a salary of 400*l.* a year, rising to 500*l.* Mr. Reid is now head of the building department of the Paisley Technical College.

W. H. Hornby Memorial.

Mr. Albert Bruce-Joy was the sculptor of the statue which has just been erected in Blackburn to the memory of the late Mr. W. H. Hornby, M.P., first Mayor of the borough, who died twenty-eight years ago. The cost of the memorial is delayed under the will of the late John Margerison, foreman in Mr. Hornby's mills, who left the whole amount, exceeding 3,000*l.*, as a tribute to his master and benefactor, in whose works he and his father before him were employed for fifty years.

Vigo-street, W.

The Royal Geographical Society having taken Lowther Lodge, Kensington, the building hitherto occupied by them at the corner of Vigo-street and Savile-row has been sold. No street widening will take place at this point, and the present building will be adapted for commercial purposes. One landmark will be removed, however, namely, the shop of Mr. Elkin Mathews, the publisher.

A New Hotel near Piccadilly-circus.

The Strand Hotel Company, Ltd., have issued their prospectus for raising capital to an amount of 300,000*l.* in respect of the proposed erection of an hotel upon the island site bounded by Air, Brewer, Sherwood, and Glasshouse streets, whereof a lease of eighty years from next October has been obtained from H.M. Office of Works at a ground-rent rising to 6,000*l.* per annum for the residue of the term after the third year. Mr. W. J. Ancell and

Mr. H. Tanner, jun., are the architects of the undertaking.

Commons and Footpaths Preservation

The monthly meeting of the Commons Footpaths Preservation Society was held at 25, Victoria-street, Westminster, on August 1st, Mr. P. Birkett, president, presiding. It was reported that Mr. Birkett had given evidence before the Select Committee on Commons, as Secretary of the Society, and had urged that in the applications for schemes for the regulation of commons under the Commons Act, 1876, the procedure should be simplified and the reduced by dispensing with the necessity of confirming Provisional Orders; he had pressed that the veto of the Lord of the Manor should be removed provided all beneficial uses were carefully preserved under the schemes. Mr. Chubb had also given evidence with a view to showing the difficulties encountered by local authorities in obtaining management of commons in order to order and prevent nuisances.

Church Building Society.

The Incorporated Church Building Society held its usual monthly meeting on August 1st at the Society's house, 7, Dean Westminster Abbey, S.W., Lieut.-Col. G. H. W. Windsor-Chive in the chair. A sum of money was made in aid of the objects, viz.:—Building first portions of churches at Aldersbrook, St. Gabriel, Kent; Chalfont St. Peter, All Saints, Bucks; Sandycroft, St. Ambrose, Hawarden, 75*l.*; and Siddal, St. Mark, Halifax, 7*l.* towards enlarging or otherwise improving accommodation in the churches at Bedd St. Aldhelm, Bristol, 35*l.*; Dearnley, St. Andrew, near Rochdale, 50*l.*; Groombridge, St. Kent, 23*l.*; Little Steeping, St. Andrew, 30*l.*; South Northwood, St. Alban, Surrey, 10*l.*; Oringbury, St. Mary the Virgin, Norfolk, 10*l.*; Swansea, Christ Church, Glamorgan, 10*l.*; Withycombe, St. Nicholas, Somerset, and Woolcombe, St. Sabinus, Devon. Grants were also made from the Special Buildings Fund towards building churches at Stanley Common, All Saints, 40*l.*; Swansea, St. Martin, Glamorgan, 30*l.*; Westcliff-on-Sea, St. Michael and All, Essex, 50*l.* The following grants were paid for works completed: Bishopwear, St. Gabriel, Sunderland, 250*l.*; West Stratford, St. James, Surrey, 175*l.*; Woolacombe, St. Sabinus, Devon, 100*l.*; Branscombe, St. Winifred, Devon, 50*l.*; Speenhamland, St. Berks, 150*l.*; Gyeallion, St. David, 30*l.*; Loughborough, St. Peter, Leicester, 30*l.*; Plymouth, St. Mary, 140*l.*; Kingston, St. Paul, Surrey, 50*l.*; Southend, St. John-the-Baptist, 50*l.*; Hoole, All Cheshire, 60*l.*; Somersham, St. John the Baptist, Hunts, 5*l.*; Abercrave, St. Brecons, 100*l.*; Frintley Green, St. Andrew, Surrey, 50*l.*; Rotherhithe, Clare College, Kent, 35*l.*; and Bishopham, St. Stephen, 40*l.* In addition to this the sum of 81*l.* paid towards the repairs of fourteen churches from trust funds held by the society.

COMPETITION NEWS.

A list of current Competitions is printed on page 137.

Central Market, Melbourne.

Advices just received from Australia inform us to the effect that a competition is limited to Australian architects, is proposed to be held by the Victorian Government for the erection of a Central Market at Melbourne, the cost of which is estimated at 200,000*l.*

City Hall, San Francisco.

H.M. Consul-General at San Francisco, A. C. Ross, C.B., reports that the price of 25,000 dollars (about 5,135*l.*), which was offered for the best design for the New City Hall to be erected in San Francisco, has been awarded to a firm of architects in that city (Messrs. Arthur Brown, jun., & John Bakewell), who will probably be employed as the architects for the building.

Civic Enterprises.

Town planning competitions are in progress at Huddersfield and at Dunkerque, France. It remains to be seen whether the proposed extension of Nottingham will involve opportunities for architects.

The Union Bank of Canada, Toronto. (See previous page.)

Messrs. Darling & Pearson, Architects.

Holding Housing Scheme.

tion with the Spalding Housing Scheme. The Urban District Council, J. B. Corby, F.S.I., of Stamford, has been selected from three to prepare the plans. Instructions given to have the plans prepared for submission to the Local Board, and as soon as the proper obtained the work will be com-

Children's Home at Barnet.

meeting of the Barnet Guardians Committee submitted a recommendation to effect that competitive designs be invited from ten architects for the new home for children, to accommodate more than thirty girls and thirty boys. Baughen, Chairman of the Committee, did not agree with the recommendation. He felt that the better way to employ an architect to prepare plans, which could be sent to the Local Board for approval. The matter, however, was adopted, might be settled, being partly erected by the time plans were sent in. Mr. Sweet's designs were required for a time, not a town hall or some other building. The design should be so any architect should be able to be wanted. The Chairman said it arose from the fact that the not decide upon a single architect interview and be advised by the architect. Mr. Jukes said that the difficulty was that he understood the Local Government Board were against recommending. It was mentioned that the instructions to the architects included the clause, "The style of and the materials to be employed the discretion of the competitors, and that the building should be of a substantial character without any embellishment. Economy is essential." The Committee's recommendations by sixteen votes to two.

safety of a garrison beleaguered within the keep depended upon the length of time it could hold out before it was relieved. The line of advance in military architecture concentrates itself upon the outer defences, of which the curtain was the chief, so rendering the *enceinte* or enclosure impregnable. In other words, a concentric plan of defence was the objective. The keep was dispensed with. Flanking and intermediate towers were introduced into the wall, such points of vantage being no longer square in plan, but circular, thus avoiding the point-blank of attack. The wall was thus protected by a flank fire from the engines of destruction directed against it. The fortified gate-house became a feature protected by a barbican, the name given primarily to an outwork covering the entrance, and later to what was virtually an outer and secondary gateway. Minor constructive improvements lay in the crenellation and machicolation of wall and tower, affording by the first cover for the archer, and by the second opportunity for the vertical discharge of missiles. Within the substantial defence created by these conditions, adequate buildings could now be erected in the bailey of the castle, for the comfort and convenience of its occupants, and the Edwardian type of castle may almost be called a little township, with its many offices and chapel. Indeed, the influence of the dwelling became more and more important, and the castle gradually gave way to the fortified dwelling-house. The growth of power among the people of England, moreover, offered no further opportunities to the builders of castles. Indeed, the history of the castle is written in the history of our constitutional development. It belongs to the story of our Norman conquerors, of the rise and fall of the Barons, of the growth of the Guilds and popular government. But this military architecture excites our admiration. It represents the age of our nation's youth. It is impetuous, daring, and resourceful, and the careful survey of this period which Mr. Thompson offers us is well worthy of attention.

The First and Chief Grounds of Architecture.

By JOHN SHUTE, Paynter and Architect. First printed in 1563. A Facsimile of the first edition, with an Introduction by LAWRENCE WEAVER, F.S.A., Hon. A.R.I.B.A. Published by Country Life, Ltd., Covent Garden, W.C. 1912.

MR. WEAVER has furnished us with an interesting notice of John Shute, together with a shorter notice of his printer, Thomas Marshe, and a "Bibliographical Description" with some notes and references. He has done this well, and ably made something out of little, for, as he says, "Shute's claim to architectural fame rests solely on his authorship of the first English book on architecture." Certainly nothing definite is known of John Shute's practice of the art, and the emphasis which he lays on the acquirement of the arts and sciences from "the true instructions and meanings of them that have written thereon" might well denote the amateur rather than the builder.

Tradition gives his birthplace at Cullompton, in Devon. The hamlet of Shute and its fine mansion are not far distant, and, since place names are the common derivative of surnames, there may be truth in this, although it lacks authentic confirmation.

"The First and Chief Groundes" is scarcely a treatise. It belongs rather to the curiosities of literature, and to retain its interest as such it demands the most careful reproduction, and the employment of the most adequate methods. The original plates are refined in their execution, though they lack technical skill; the remarkable caryatides, introduced as an alternative to the columns, even appear to possess a certain rudimentary grace. We cannot detect any refinement in the reproduction, for, owing to the process adopted, any defects in the originals have been intensified, and the reproductions of both text and plates are unworthy of the occasion.

The Main Drainage of Towns. By F. NOEL TAYLOR, Civil Engineer. (London: Charles Griffin & Co., Ltd. Pp. 313. Illustrations 350. 12s. 6d. net.)

THOSE who are familiar with Mr. Taylor's "Civil Engineering Practice" will be interested in the publication of a new book by the same author, and described by him as a companion volume to that work; it is, in fact, an elabora-

tion of some of the chapters in that encyclopædic achievement dealing exhaustively with one of its most important sections, and repetition has been allowed only in so far as it has been necessary to make the new work complete in itself.

After three chapters containing the needful information on such preliminary subjects as Maps, Procedure, Hydraulics, and Calculations, the author proceeds to deal in considerable detail with the more practical problems connected with such subjects as the various methods of trenching, tunnelling, shaft-sinking, the construction and qualities of numerous types of sewers, the much-disputed question of ventilation, storm overflows, outfalls, and pumping systems. The chapter which is included on House Drainage would seem to be somewhat outside the scope of the work, and shows evidence, in one or two references to practices not usual in England, of the author's large experience in Dublin.

The theoretical side of sewage disposal and the design and construction of disposal works are adequately considered in the later part of the book, and the last chapter is devoted to the special construction necessary in conducting sewage across rivers. There are four useful appendices and a full index; the illustrations and text descriptions are ample and clear, and the book as a whole deserves as warm a welcome as was accorded to the larger volume referred to above.

Iron and Steel Constructional Work: A Concise Handbook with Examples for Practical Application. By KARL SCHINDLER. Translated by CHAS. SALTER. (London: Scott, Greenwood, & Sons. 1912. 3s. 6d. net.)

THIS little book of 115 pages of text, and a further twenty-five of tables and index, deals with the calculation of columns of cast-iron and steel, beams and floor construction, roofs and staircases, skylights and glazed roofing.

It is a translation from the German, and will be useful to draughtsmen and others who have already some elementary acquaintance with the subject—the formula adopted as a basis in dealing with columns is Euler's, and the mathematical knowledge demanded from the reader is very small.

In addition to the theoretical matter, a few practical notes are given, and these are not invariably in accord with good English practice. For instance, the interposition of sheet-lead between machined faces "to ensure an equal distribution of load" would not now be tolerated in fairly good work, but is twice mentioned in the chapter on cast-iron columns. There is also mention of the desirability of rounding the angles of the core in a square column "lest in the casting the sharp edges of the core should be damaged by the molten metal, which might thus give rise to flaws," but no general warning is given against the use of sharp angles in castings, with the possible internal planes of weakness arising therefrom. The importance attached by the author to allowances for expansion of girders is far beyond that which the daily practice of engineers in England will support.

Safe loads for use in calculating the carrying capacity of floors and roofs and the bearing capacity of foundations are given, but it should be borne in mind that there are now a few figures of this kind sanctioned by insertion in the London County Council (General Powers) Act, 1909, and while some of them would be very hard to defend upon any basis of experiment or theory, yet so long as they are upon the Statute Book it would be well that they should be borne in mind and quoted by writers of books like the present.

These points, however, do not affect the main argument of the book, which is simply, clearly, and consistently put, and is illustrated by numerical examples that will greatly assist the student.

BOOKS.

Architecture in England During the 15th and 16th Centuries. By A. HAMILTON THOMPSON. A. Illustrated by 200 photographs, and plans. (Henry Frowde, University Press, London. New York, and Melbourne. 1912.)

THE author has made an interesting contribution to the subject of military architecture. "The Fortresses" of Viollet le Duc is a time the standard work in this time that have our opportunities have been enriched by Mr. C. T. Harvey, and others, including of various archaeological societies. The book is a new and well-arranged presentation of the subject is welcome. The book is a survey of the hill fortifications, and the defences of prehistoric time, and so prominent a part in the landscape—cyclopean in their mass—of Sarum and Maiden Castle. But a history are scarcely forthcoming. "The Normans" to walls; their strength, after they in the country, lay neither in earth-stonework, but in the boundary of marsh that extended round their "The dominating feature of the castle was the keep or donjon, a square rising upon a mound and surrounded by a ditch." Natural formations of ground were and utilised with the greatest skill, but a mound was, if possible, built. But the object of the castles the Conqueror most often being a particular town in subjection, as could not always be chosen at official earthworks were necessitated. A curtain wall surrounded an enclosure containing such buildings as might be a garrison, and abutted upon the a system of constructive defence made in its conception to continue to be a true square tower was by a more complex plan, but this simple curtain did not afford protection to the enclosure. The

CORRESPONDENCE.

Signing Buildings.

SIR,—Referring to your "Note" in this week's issue, entitled "Credit to Whom It Is Due," may I emphasise your closing remark on "the excellent practice of signing buildings."

It is often deplored that the general public show so little interest in architecture. One reason for this is that our buildings are given to the world without a personality associated with them. There would be little appreciative interest in literature without the author's name, and a picture is not judged without the painter, so why should not the architect and his work be likewise inseparable!

A visitor to Paris finds every building branded with a name, too loudly, perhaps, but he becomes aware that there are beings called architects. The natural outcome of signing buildings will be an enhanced interest of both the author and the public, by which the quality of our work will be influenced.

A. T. BRADFORD.

The Further Road Improvement at the Marble Arch.

SIR,—The ill-founded rumours that shops were about to be erected at the Oxford-street end of Park-lane has entirely overshadowed the fact that an important road improvement is about to be carried out there through the generous manner in which the Grosvenor Estate has agreed to set back the new building line of the proposed block of buildings at that corner.

In the original plan for the Marble Arch Improvement, published in 1905, the rounding off of the north-east corner of Park-lane and the demolishing of the unsightly stables there formed part of the scheme, not only on account of the traffic, but also on aesthetic grounds. Although for a time I had to withdraw that portion of the scheme on account of existing leases, no opportunity has been missed during the past seven years in pressing home its importance.

Oxford-street will now be widened at this point by 16 ft., and Park-lane at its north end by 10 ft., the junction of the two thoroughfares being thrown off by an additional 27 ft. being thrown into the public thoroughfare, which is exactly the extra space at this point that was asked for in the original improvement scheme. North-row, leading out of Park-lane, will also be widened by several feet. The ground the Grosvenor Estate is thus giving to the public is no less than 5,139 sq. ft., and I am advised by competent authorities that its freehold value is well over 60,000.

Although everyone that has the slightest knowledge of town planning will regret that the interested public authorities have not availed themselves of this opportunity to acquire further land at this point in order to give symmetry to the Place at the Marble Arch, yet I am sure all Londoners will desire to express their gratitude to the Grosvenor Estate for this generous gift.

F. W. SPEAIGHT.

INTERCOMMUNICATION COLUMN.

Skylight in a Roof.

SIR,—I have been interested in a case which has come under my observation, the circumstances of which are as follows:—

Is a skylight in the opening of a roof a window the glass of which is to be kept in repair by the tenant, or is it part of the roof, to be kept in repair by the landlord? The lease stipulates, the lessee to do all internal repairs, including the glass of the windows. There is a fixed skylight in one of the roofs, about 3 ft. square, with two panes of Hartley's plate-glass, to light a staircase, having lead flashing and gutter outside and casing inside to stop plaster of ceiling, and one of the panes was broken with a blow, and, of course, the rain comes in. The lessee wrote to lessor to repair same, being part of roof. The lessor writes it is the lessee's place to repair the glass of windows, referring to dictionary, which describes skylight as a window in roof lit from above, and defines it as a window in the opening of a roof, as a sash and frame is a window in the opening of a wall. The lessee goes to his lawyer, who contends it is a glass tile in a roof. He can find no test case in law books, and it was open for legal argument.

Being a matter of only a few shillings it was compromised without the lawyers. J. E. D.

[*] Your query is one of interest, and as we know of no case covering the exact point we publish it, as possibly some of our readers may be able to throw light on the question. Of course, to determine the liability of the particular tenant it would be necessary to know the exact covenants as to repair, and how the blow was struck which broke the skylight; but treating the case simply as a lease in which the lessee covenants to undertake the internal repairs, including the glass of the windows, but the landlord undertakes the external repairs, including the roof, and the damage not to have been caused by the tenant's negligence, we should imagine that a court would construe both words in their ordinary accepted meaning. If the roof was a covering of any sort of material and the windows as the ordinary openings in the walls. It is to be noted that the liability to repair the windows is an exception on the tenant's obligation only to undertake internal repairs, and as such the exception would be strictly construed. The covenant to repair the roof relates essentially to an external matter, and it would appear straining the language of the lease to except the skylight as a window. We can, however, express no definite opinion on the point, especially without knowing the terms of the lease and the precise terms of the covenants.—Ed.]

Undervaluing Property.

SIR,—My attention has been called lately to the great number of property owners who have suffered probably through depression in trade and directly or indirectly by recent land legislation. In several cases owners have lost their all, having invested their small earnings in equities, and mortgages, hoping in so to secure their money or asking the mortgagees to reduce where they have not the money to meet it. Unfortunately there are many surveyors called in to value property who have never served their articles in a surveyor's or an architect's office; this may account for some of the low valuations.

Can a property owner recover any loss which he or she may sustain from the valuer through a low valuation? The surveyor will be careful to secure a good margin for the moneyed man or mortgagee; on the other hand, ought not the surveyor to study the interest of the owner as well as the mortgagee? If a surveyor over-values a property, the mortgagee can recover the loss from the surveyor. Why cannot a building owner recover his loss also from the surveyor through a low valuation?

Is the valuation to be based on the net rentals? If so, this is not always fair, especially where the buildings are well and studiously built; consideration should be given to the actual cost of the buildings which one would take as the true value. **FAIR PLAY.**

[*] We are afraid we do not exactly fall in with the point you wish to make. If a value is placed too low for the purposes of a mortgage, we do not quite see how the owner can be damaged. If the mortgagee calls in his money, the property owner has abundant security and could raise a new loan, paying off the old mortgage. If, however, the mortgagee could show that he had suffered damage from a value being placed too low, we presume that the valuer could be made liable on the same principles that apply to a case of over-valuation if the loss was directly due to negligence on the part of a valuer engaged by the property owner; but, of course, a mere error in judgment would not suffice, and any loss would have to be traced directly to his negligence. With reference to your second query, neither the net rental by itself nor the cost of the building alone forms the basis of valuation, as many other considerations arise, and we can only refer you to text-books on valuation. In Mr. Webb's work on "The Valuation of Real Property," an instance is given at p. 53 where surveyors were held liable for having valued a property, relying too much on the cost of building. In the first part of your letter you give instances where owners of property have suffered loss owing to the depreciation of property through depression of trade or increased taxation. These appear to be cases where over-valuation, in the light of subsequent events, has been the cause of foreclosure. Over-valuation rather than under-valuation is likely to be the cause of loss to both mortgagee and mortgagee.—Ed.]

Cost of Schools.

SIR,—Can any reader state where figures can be obtained showing the cost of schools (a) elementary, (b) secondary, and (c) any other type, per head, exclusive of cost of site?

CHRISTOPHER.

ILLUSTRATIONS.

Port of London Offices.

E illustrate herewith the design by Messrs. Bowden & Wallis for the new head offices of the Port of London Authority. To which we referred as follows in our issue of June 14th:—
"Messrs. Bowden & Wallis produce a design on very different lines, the square frontage being squared and the Offices occupying a rectangle lining Savage-gardens and running through Crutched Friars. In this design the have tried to carry out the suggestion of a large hall containing the departmental central portion of which forms an immense 100 ft. in height, top-lighted, round, arranged the remaining accommodation on four floors with an upper floor at the roof of the hall. An entrance-hall at each end gives access to a wide vestibule at either end of which are placed the stairs, and beyond this corridor is a hall previously mentioned. At either end of the central hall are corridors cutting the vestibule corridor at either end, and at outer blocks and corridors repeat on each side of the central hall. The Port Rates Office occupies a large space in the centre. It is the treatment of the office, divided into two portions and from an immense height, which forms a doubtful feature of the design from a view of plan. The scheme is generally conceived, but the detail and features of immense scale, and would, we imagine, much reconsideration to render such a scheme satisfactory. The sides of the central hall in particular show evidence of wide consideration and care in designing. The details are well conceived, but here a detail is somewhat coarse and heavy, which surmounts the tower being like 30 ft. high, and every part of the building on an equally enormous scale. Its main proportions there is little fault with the design, the front to Trinity being on dignified and architectural lines."

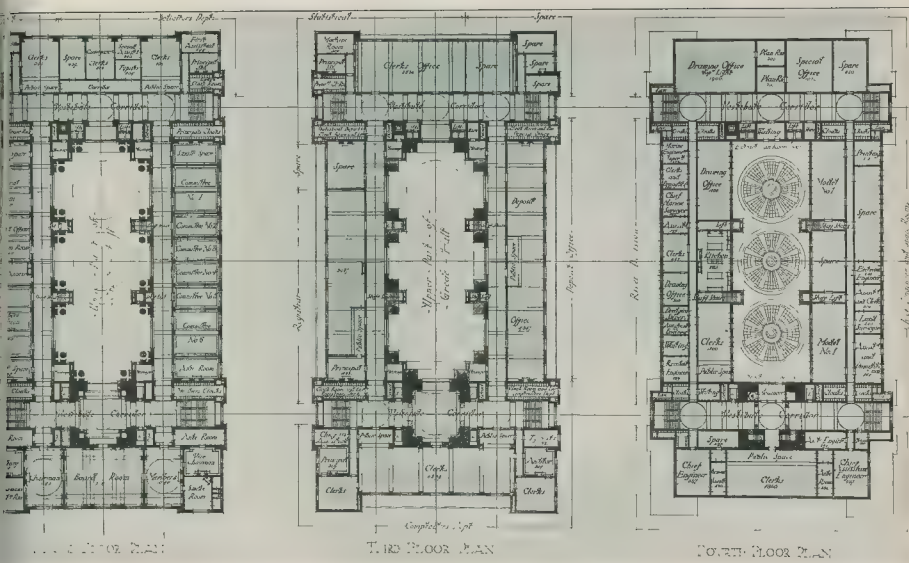

Regent's Quadrant Competition.

ILLUSTRATIONS have been given since our issues of July 12, 19, and 26, on the Regent's Quadrant, and one of this week is devoted to the schemes of Messrs. Drysdale, A.R.L.B.A., and Messrs. C. Gibbs.

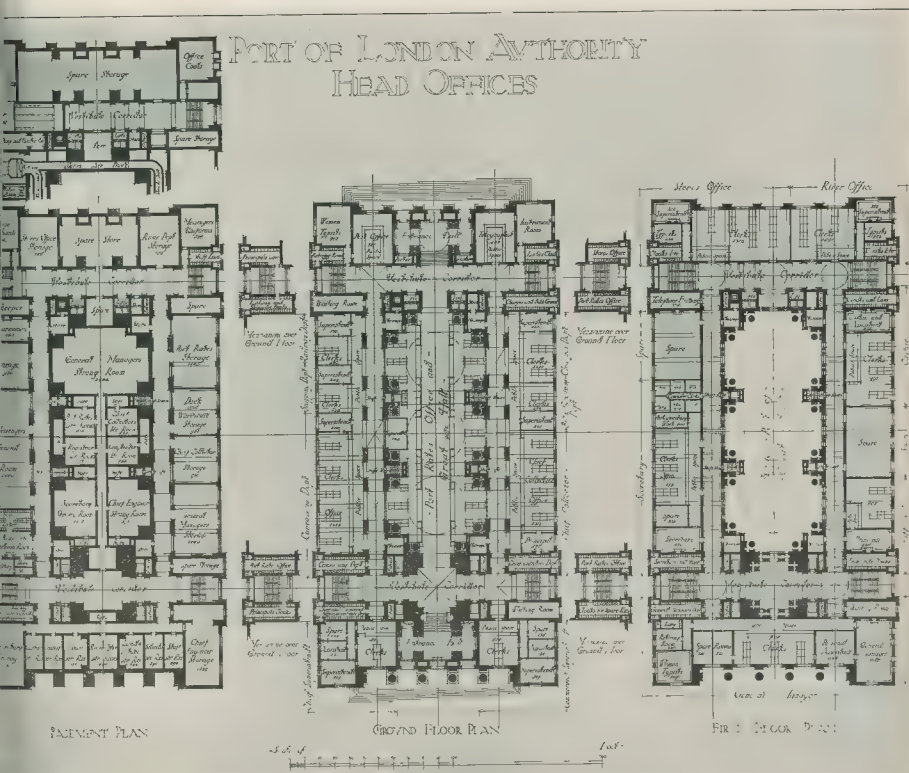

Mr. Drysdale writes:—
"My desire in this design was, first, to obtain an abundance of plate-glass; secondly, to keep the main horizontal lines, to get more scale into the existing facade of a more classical intercolumniation, while the mezzanine was designed continuous beam for the columns to support."

Messrs. Cromie & Gibbs send the notes to accompany their design. Naturally the dominating factor in their minds was the line upon which the competition was formulated. A definite problem was set down for solution, invited to regard the existing hotel as a *fait accompli*, and, except in regard to the western bay, to set to work to see if could not be produced that would fit with the present block and at the same time, within reasonable limits, to demands of the lessees.

Agreeing that any proposal to "improve" the situation of the hotel would be "unthinkable," we at the time realised that anything in the nature of reproduction would not be eminently for either retail or showroom purposes that even the desirability of doing away with the uncomfortable circular windows and giving more lighting area generally tended to a somewhat different treatment. The and coupled columns had to go in fact the leaseholders insist upon an structure of best British plate the employment of even single columns or pilasters inadmissible. Such an extreme view commend itself to us, hence our endeavours to continue the present facade in shape, and line, to make the detail subservient respects to the usual requirements of tenants, and in others to a rather more ideas of architectural design, besides to mind the desirability of working on that might be acceptable to the Comm-

Port of London Offices : Design by Messrs. Bowden & Wallis.

"The Builder" Regent's Quadrant Competition: Design by Mr. Moritz R. Martin, A.R.I.B.A.

of H.M. Office of Woods and Forests, not without some thought for the commercial necessity of obtaining as much space as possible in plan and window area. While fully recognising the force of recent arguments in Parliament and Press anent the "perfect proportion," etc., of Regent-street and the overwhelming (*sic*) scale of the hotel, we cannot suppress the opinion that a somewhat false impression of the true proportions of the street is obtained owing to its sharp turn into the open area of Piccadilly-circus, and a decided tendency to magnify the scale of the hotel owing to the juxtaposition of the small-fronted shops with doll's-house windows on either side.

Complete Mr. Norman Shaw's quadrant in perspective and compare it, with due courtesy to all concerned, with any other scheme, it is high above the rest.

We do not think that Regent-street would suffer enormously if it were all some 97 ft. to the ridge. We agree that there should be a limit to the height of street buildings, but, beyond a quite legitimate sense of conservatism, there seems little enough to recommend a mere rebuilding of the Quadrant without any attempt to put the property upon a financial basis capable of automatically realising its cost (as has been done in Waterloo-place), and at the same time falling into skyline with, and completing, a very dignified conception. We have therefore, like many others, striven to achieve the *juste milieu*.

On this page we illustrate also the design of Mr. Moritz R. Martin, A.R.I.B.A., who writes—

"The author's *motif* has been to produce a design as little out of harmony with Mr. Shaw's façade as possible, and treated in a restful and orderly manner suitable to the contour of the frontage and the consideration of future extensions. While embodying the main architectural lines of the Piccadilly Hotel, the adjustment of the frontage line as shown on plan tends to produce the following advantages: (1) Both aesthetically and practically satisfactory means of support for the superstructure, entirely independent of the window treatment; (2) identically the same amount of glass area in shop windows as now exists; (3) a shopping promenade well lit from above and below, with tea balconies over approached from mezzanine floor level; (4) gain in floor area of upper stories; and (5) the slight set-back would accentuate the individuality of the hotel and Air-street treatment in its plainer setting. The materials would consist of ashlar facing to

match the hotel, green Italian tile and copper roofing, and bronze casements and enrichments. The promenade and the same treatment generally is intended to continue along the Circus façade, with a similar campanile at the Piccadilly corner: the upper colonnaded stories of the latter being illuminated at night time with bronze tripods and flambeaux. The subdivision into bays is effected by Ionic pilasters embracing three stories, and adjusts the tenants' apportionments practically as they now exist."

FIFTY YEARS AGO.

From the *Builder* of August 2, 1862.

On the Spirit of Modern Work.

ALL good work in the present day must be a protest against the triviality, money-worship, and machine regularity of our time. It does not follow that such should be the spirit of work in another age; but in ours it is plain that art must fight the ease, elegance, and sensuality of modern society, because in themselves they are detestable traits of character. Designers are now chiefly occupied in drawing patterns for articles to be made by machinery—not a very noble occupation for human minds; and their designs never can be anything but geometrical patterns or symmetrical foliage—also not a lively prospect. Now, surely, a wall with a flight of birds painted on it, and half a dozen of them having a good fight in the Japanese manner, is more interesting and contains more life than a million diapers. But this work cannot be done by machinery; you cannot throw life into anything made by machinery; a hanging or carpet, with some violent grotesque dragons, animals, fish, doing something, not in a state of modern lethargy, is more amusing than the incipient, chilling, flat patterns one is treated to now. The spirit of Japanese work is right—full of life, vigorous, and severe.

** Fifty years ago Alfred Stevens was employed in designing ornament to beautify cast-iron grates of an impossible style. One might imagine that no finer opportunity for achieving an artistic success was ever offered to commerce, yet no more signal

instance of failure was ever known. But another co-operative example of work which has done more than almost else to further the progress of our design. In 1861 the firm of Morris, Faulkner, & Co. was established, and showed that it was possible to make fittings and materials to designs which satisfied the demands not only of the Public as well, and they were nevertheless, to dispose of their product at a profit. Other firms were not slow to take advantage of this discovery, and sequence to-day, although it would be easy, we fear, to point to plenty of commercial designs that are as bad as well be, yet at the same time it is admitted that the general advance in direction has been very marked in recent years. From what one sees in the showrooms of the better-class manufacturers in the galleries of exhibitions, and in the rooms of many a private house, it is that scarcely any article of everyday has been neglected by the designer, and that good furniture and materials may be had by going to any way about obtaining them.—ED.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

Sir Maurice Fitzmaurice, C.M.G., Engineer to the London County Council, entered on Tuesday the certificates won the summer term by the students at the Palace School of Practical Engineering, a course of an address: he stated that the school had maintained its reputation for many years. He had had some of the old students on his staff, and he was glad to say they were been quite satisfactory. In the course of subsequent remarks he said the man got a good engineering education had pulled over all the others. Particularly the case with men who went abroad, pressed upon them the necessity of learning foreign language, and, if possible, two languages. He knew they would make mistakes, but those who had a good education in the fewest mistakes. They should not try to correct their mistakes, but go and tell them they had done. He would think all of them for doing that. They would learn more from mistakes than from successes.

MONTHLY REVIEW *of* CIVIC DESIGN.

TORONTO.

TORONTO, the capital city of Ontario, and the seat of the Provincial Parliament, is situated on the north shore of Lake Ontario, some 40 miles from its end. Long before the conquest of the country by the white races, Toronto, as the name signifies, was the terminus of the principal Indian trail which connected Lake Ontario with Lake Huron. It was a position of great importance, and a trading post was first established here by the French in 1749, and named Fort York. Its position on the lake shore is marked by an obelisk in the present city grounds. This fort was deserted by the French in 1759, when the French forces were withdrawn to meet the English attacks on Quebec and Montreal.

At the termination of the American War of Independence many families left America, and, settling in Canada, were known as the United Empire Loyalists. Many of them found their way to the site of Toronto and became the original founders of civilisation in a city which has eventually grown into one of the largest cities in the Dominion. This is, no doubt, due in the first place to the selection of this spot by the Imperial Government as a safe and convenient site for the capital of the Province. America having become an independent country, it was decided that Newark, the old name for Toronto-on-the-Lake, was too near to the water to be suitable for this purpose. The site of Toronto having been surveyed in

Convocation Hall, Toronto University.

1788 and found to be capacious and well sheltered, Lieut.-Colonel Simcoe, the first Governor of Upper Canada, laid out a small rectangular town, which he called York. Under this name it was taken by the Americans in 1813, when the Parliament House and records were destroyed. In 1834, with a population of 10,000 and a rateable value of three-quarters of a million dollars, the town became a city and reverted to its original Indian name of Toronto—"a place

of meeting," York being retained as the name of the county. The first mayor was William Lyon Mackenzie, the reformer, who inspired the rebellion with which his name is associated.

In spite of an outbreak of Asiatic cholera, which carried off one in twenty of the population, the newly-created city started on a career of prosperity which has raised it to a population of more than 250,000, with an annual revenue approaching 7,000,000 dollars. Its present prosperity as the largest wholesale distributing centre in the Dominion is, no doubt, due to its advantages for cheap freightage both by rail and lake, and to the fact that the best purchasing market in Canada lies close to its door. More than 200 freight trains enter the city every day, and in 1909 the harbour was used by some 2,900 vessels amounting to a tonnage of 1,480,000.

Apart from its manufacturing and distributing activity, Toronto has many attractions as a place of residence. It possesses some delightful residential quarters, 1,700 acres of parks and gardens, summer suburbs east and west along the lake shore, and in Toronto Island, enclosing the harbour, it has a summer pleasure-resort within a few minutes of the business centre of the town.

But for all its prosperity and natural charm of position, Toronto lacks the one thing needful—a reasonable and comprehensive city plan. Efforts have been made from time to time by the Civic Guild of Art to overcome this difficulty, but hitherto without success. It is, however, well recognised, we believe, that the most pressing need is for diagonal thoroughfares and for some relief to Yonge-street, which is the principal or only direct tramway route from the northern residential quarters to the business centre.

The destruction of the charm of the harbour and lake front by the railway is also greatly deplored. It has been suggested that this line be removed and the through traffic be taken on the northern line, which runs east and west at a distance of some 2½ miles back from the lake front. A union station for both the Canadian Pacific and the Grand Trunk Railways would then be placed in the centre of the city in connexion with this line, while railway communication with Ashbridges Bay and the harbour could be retained in the valley of the River Don.

There is no doubt that the lake front, at present so disfigured, should be the principal asset of Toronto. Early paintings and drawings now preserved in the City Hall give some idea of its original charm, and of the possibilities which were eventually wrecked by the construction of the railways. In the more modern towns of the West the railways

Canadian Bank of Commerce, Toronto.

Sketch Map of Toronto, showing Railway System and Principal Streets carrying Electric Tramways.

arrive first, and, as they create the towns, they naturally have the first choice of position; but this was not the case in Toronto, and it seems now to have been a short-sighted policy which allowed them to appropriate and disfigure the lake. It is to be hoped that this matter will be taken in hand without further loss of time, as in all probability it will never cost less than at the present moment.

A glance at the sketch map will show that, although building has spread to the east of the River Don, the principal part of the city is contained between the two rivers Don and Humber, and between the lake front and the railway to which we have already referred. This railway runs along the foot of a rise which was once the shore of the lake, but now forms a high plateau intersected by ravines created by the two rivers and their tributary streams. This district is being rapidly extended and laid out as a high-class residential quarter, efforts, however, being made to preserve the rural charm of the wooded ravines. Although there is still much to be done in the direction of preserving the natural beauty of the outskirts of the city, the inhabitants are quite alive to the necessity. On the eastern bank of the Humber, High Park, a large tract of beautifully wooded and undulating ground, secures its amenities for a considerable distance back from the lake front, and we understand that negotiations are now in progress for preserving the western bank in a similar way.

The valley of the Don is unfortunately disfigured by the railways, and as far as the southern part is concerned there is not much beauty to preserve, but in the northern part of the city some still remains, and we are glad to see, by the rejection of the proposed Bloor-street viaduct, that public opinion is not indifferent to the advantages of preserving it. The proposal to create a garden suburb on the eastern side of the city is another indication that it should not be difficult to rouse public interest in a general town-planning scheme for dealing with both the city and its surroundings in a thoroughly comprehensive manner.

CONCERNING SHOPS.

THE competition recently promoted by this journal for the rebuilding of Regent's Quadrant calls attention to the whole question of the relative positions of shops and other buildings as incidents in the corporate life of the city. As was pointed out in a leading article, the question of town planning lies at the root of the whole matter. This applies not only to the placing of shops on an angle site that might be thought too important for them, but also to the position of the Piccadilly Hotel. Though this neighbourhood seems to have been

considered by those interested in this branch of commercial enterprise a suitable one for a large hotel, yet it is very questionable whether the actual site itself is in any way ideal, even from the point of view of the hotel itself. From the point of view of the city as a whole the hotel should not have been allowed to thrust itself into a quadrant of shops, thus creating a difficulty which no amount of ingenuity appears able to overcome. It is not perhaps sufficiently realised that if buildings are to harmonise with one another when executed they should have some harmony of underlying idea, and that those that will not harmonise naturally should not be placed in immediate juxtaposition. If they are so placed they will either compete and clash with one another, or modifications entailing some loss of efficiency and character must be made to bring them into proper relation. It is not contended that it is impossible to harmonise shops and hotels. It has been done, with perhaps no more loss of character and efficiency to either than civic design entails on every building. Where, however, there is a quadrant to be treated as a whole, the problem appears to be simplified when all the buildings in the sweep are of the same nature. If it is necessary to provide for buildings that differ in character, it would seem more reasonable to place them as terminal features or pavilions at either end of the curve. If it be true as a general principle that things are only beautiful when in their right places, then this question of the right placing of buildings of different requirements and character is one of the greatest importance. Indeed it is probably no exaggeration to say that from the point of view of the whole city it is far more important to make restrictions as to the position of buildings than as to the character or features of the actual buildings themselves.

All buildings of whatever nature tend by both economic and architectural laws to assume certain definite characteristic and well-recognised forms. They would still tend in this direction, whether restricted by by-laws or not. A row of buildings all of the same nature would probably tend to produce a satisfactory harmony of general effect, without the need of restrictions. If this view is correct it would seem probable that better results would be obtained by admitting only buildings of a suitable character to any given street, and then leaving them to develop naturally rather than by admitting buildings of opposite characters and endeavouring by harassing restrictions to reconcile things which in themselves are fundamentally different.

Restrictions of both sorts may be necessary, but the point seems to be that it is futile to trust to restricting such matters as heights and materials, while the speculative citizen is permitted to place a building of any description on any site from which he hopes a profit may be derived.

Public sentiment, no doubt, is for giving private enterprise a free hand, but it must be

remembered that the speculator is not right in his choice of position even as far as profits are concerned. Every building of financial success, although it would probably be an exaggeration to say that when a building such as a theatre or an hotel, has been a failure, such a result is in every case traced to an inappropriate site, yet perhaps be considered as a contributory cause. Reasonable town-planning restrictions in such a direction would, in many cases, we think, prove a blessing in disguise.

The same line of argument might be applied to the buildings themselves. It may have a good general idea of the building that best serves their purpose, but may be apt to concentrate on and exaggerate certain features to the detriment of others equally important, but not so obvious, and may not see the desirability of varying the general rule to suit the particular instance. In the case of Regent's Quadrant it may be that the shopkeepers are a little too insistent on necessity for so much light and plate glass, considering that the street is some 40 ft. wide. Were it a 40-ft. road or a 20-ft. lane the position would be different. It would demand a front entirely of glass for every shop, and aspect and for every class of shops such that the shopkeepers' ideal is a green wall, whereas it is evident that goods require to be seen from the sun, and that some class of goods will be damaged or lose their colour from overlight, and that the amount of light required depends largely upon the nature of the trade.

It is noticeable also that the methods of retail trading vary. Some do not put all their goods in the window. Many shops are seen where a few choice specimens only are put out to excite the interest of the passer-by, and tempt him to enter in order to see the still perfect specimens that may be supposed inside. This method does not require so much an expanse of glass, and if it is on the whole we may well pause before we accept the demand for unlimited glass as the last word in the subject.

The point is of some interest in view of the increase of traffic in our main thoroughfares and the nuisance caused by the crowds of loiterers. If the shopkeeper requires a large expanse of showcase before which the can loiter without necessarily entering the shop, it might be thought that such loitering should be provided at the expense of the shopkeeper, and not at that of the traffic, by things are now the shopkeeper, by bringing showcases out to the pavement, utilising it for his own purposes. It becomes a part of the area of his shop, for which he does not rent. The fact that many shops are putting up recessed entrances and showcases suggests that a certain amount of loitering space recessed from the traffic is valuable to the shopkeeper as to be

War Memorial, Toronto.

and that further development in this may vary the architectural problem of the public pavement by the trader of the town is a matter which consideration—from the fashionable who renders the West-End pavement to the cheap butcher in the suburban roughfare who hangs up carcasses out-top projecting over the narrow pavement carries them on his shoulder across the busy hours of the day.

the whole question of the position, of, and proper access to the various shop is an aspect of civic design to be study should be given.

SEES AT CARMARTHEN.

ROADS AND ROAD SURFACES.

nd construction to-day the chief diffi- of obtaining at a reasonable material which will stand all kinds e equally well. A splendid surface obtained for motor-cars and light traffic, but it is too expensive eal use, and it will not stand heavy ated loads. On the other hand, ag usually adopted for the heavy loads, urable, is too noisy to be universally t. Hence it is necessary to adopt materials for the varying classes of Street traffic may be divided into moderate, and light. By heavy traffic e the more or less continuous loads e from docks, stations, and warehouses, can only be safely borne by granite sett For light traffic the existing macadam tion is quite ample.

s with moderate traffic carry all sorts e light and heavy, fast and slow, horse- and power-propelled. For such streets paving of some kin', such as asphalt, ost desirable, but even if asphalt could satisfactorily the loads put upon it without e annual repairs its first cost would its adoption by most, if not all, of icipal and county authorities charged maintenance of roads. Laid on a good concrete asphalt in some parts of the costs about 13s. per square yard at the price which is in excess of that paid nary granite setts. As the ordinary thority is limited in its expenditure, it elled to do the best it can with the e and resources at its disposal until the ad surface is introduced. The ideal must be dustless and noiseless, must

Houses at Carmarthen.

possess wearing qualities of no common order, and—most important of all—it must not cost more than 1s. 6d. per square yard.

One of the best systems of inexpensive road construction, the invention of Mr. J. A. Brodie, City Engineer, Liverpool, is a material called pitchmac. The construction of a pitchmac road may be described as follows:—A layer of 2-in. dry macadam is spread evenly on the existing foundation to a depth of 3 in. and rolled dry. This is grouted with a mixture of hot pitch and sand and again rolled in order to thoroughly consolidate the mass and reduce the interstices. A second coat of stone 1½-in. gauge, to give the required thickness, is then spread, preferably whilst the bottom layer is still hot, rolled to an even surface, grouted as before with the addition of a little Portland cement to the grout, and well rolled immediately after, the surface being blinded with whin or granite chippings. A considerable mileage of pitchmac streets has been laid in Liverpool and other towns, and after a lapse of half a dozen years it is still standing the heavy traffic well. It may be put down to a depth of only 3 in. in existing streets. The cost per square yard works out at 2s. 9d. and 4s. for depths of 3 in. and 4½ in. respectively. This is more than can be spared in many quarters, and there are the further disadvantages of using semi-skilled labour and endeavouring to avoid moist weather.

Satisfactory results have been obtained at less cost with the familiar tar macadam, which, so far, is the only proved material which satisfies the conditions required for streets with moderate traffic. The construction of a street surface with tar macadam is simplicity itself. A coat of 2-in. or 2½-in. tarred stone is first laid down and rolled, and upon this a second coat of the same material broken to a ½-in. size is imposed and rolled into the voids. A final coat of ½-in. or ¾-in. tarred chippings is then laid down and rolled to a true camber, giving an even surface. Later on the surface is painted with a coat of tar, on the top of which fine broken stone or dust is thrown. This gives a road not unlike asphalt in appearance at a cost of from 1s. 6d. per yard upwards, and if the

work is well done to begin with an additional coat of tar paint and dust once a year will be all that it requires for some time in the way of maintenance. To lay roads of tar macadam satisfactorily in a variable climate like ours one must be ready to accept such spells of fine weather as may arise and be able to draw in a good supply of well-prepared material on very short notice. This implies that the material must be conveniently placed for ready handling. These conditions are possible of attainment only where a mechanical mixer of some sort is in use, and preferably when the mixer is the property of the road authority.

In this connexion it is interesting to note that the Holborn Borough Council are proposing to pave about 200 yds. of main road between Bury-street and Kingsway with granite setts as an attempt to deal with the new problem created by the great weight of the motor vehicles now put on the road. Tradesmen on the route have protested on the ground of increased noise, but it has been pointed out that Tottenham Circus, the junction of Tottenham-court-road and Oxford-street, has already been paved in this way, and, although protests were made before the pavement was laid, none have been made since it was finished. This may be due to the improved form of the granite setts. The ordinary ones are narrow and deep; these are wide and shallow, and have a fine squared joint filled with bitumen, which gives as close a joint as a wood block flooring. Of course, the question of cost is the main consideration. The following figures show the saving—With granite setts the estimated cost over this space for fifteen years is 3,122l., or 1s. 6d. per square yard per annum. With asphalt, for eleven and a half years the cost was 4,644l., or 2s. 6d. per square yard.

TOWN PLANNING IN SHEFFIELD.

SINCE the passing of the Housing and Town Planning Act, 1909, the work of town planning has received considerable impetus in Sheffield, where about 12,000 acres of land are at present

available for development and for inclusion in a comprehensive town-planning scheme.

Having decided not to deal at once with the whole of the undeveloped area, the City Council selected three areas for treatment in the first instance, with the intention of taking in hand other sections from time to time as convenient and necessary.

The points to which the Town Planning Committee thought it desirable to give immediate attention were the width of existing main roads, the lines and width of new main and secondary roads, the set-back of the main building line, the provision of open spaces, and the number of houses to the acre.

Arrangements of a satisfactory nature have been made for securing the co-operation of land and property owners, and it has been settled that the road and street widths shall be as follows:—Existing main roads, 80 ft.; secondary roads, 65 ft. and 60 ft.; and subsidiary streets, 40 ft.

Speaking generally, it may be taken that in residential and good class districts the number of houses to the acre will be limited to twelve, and in areas adjoining working class districts to from twenty to twenty-four.

The set-backs agreed upon are:—Existing main roads, 15 ft.; proposed new main roads 15 ft.; secondary main roads, 15 ft.; and subsidiary streets, 10 ft. Since the Local Government Board inquiry of January last the Corporation have received permission to proceed with the preparation of their schemes, the details will be considered at a subsequent inquiry.

After the preliminary plans had been prepared the Committee decided to proceed with two further sections, bringing up the total area of the town-planning schemes to 4,260 acres, which is more than the combined area of the adjacent towns of Barnsley and Doncaster, and greater than the area of some towns with populations of approximately a quarter of a million.

THE DUAL ASPECT OF ROADS.

If we could imagine that our great cities could have grown to their present size without railways, and that the whole of their present-day traffic was by road, we could hardly suppose that they would be satisfied now with the state of the roads as we find them to-day. We should have to imagine a great alteration in the character of the intervening country; main roads widened and straightened, inns and forges and other conveniences of travel more frequent and more conveniently arranged.

But the improvements to these roads, which will probably be soon brought about by the needs of motor traffic, will have to be considered equally from other points of view. Since the introduction of railways our civilisation has undergone a great change. The existence of our large towns has created an indoor population that hankers after fresh air and needs to seek its recreation out of doors, and the public roads and commons are the only public recreation grounds of the common people. Our ancestors, who lived a strenuous outdoor life, regarded walking, riding, or driving as means of locomotion; we who live sedentary indoor lives value them for their own sake as forms of exercise and recreation.

From this point of view every road, whether in town or country, may be considered in two aspects, either as a means of communication between two points or as a public promenade and place of recreation. Every road is used more or less for both purposes, either of business or pleasure, but the degree to which one purpose or the other predominates varies with its position and character, and this variation produced different results in the towns to those produced in the country.

When we walk on business we seek our destination. When we walk for pleasure we seek pleasure in our surroundings. In the town we seek colour, life, and movement and the interest of human surroundings. We avoid the dull, back streets, and find it in the crowded traffic of our main thoroughfares. In the country we seek solitude and rest. We avoid the dust and traffic of the highways, and find it in the lanes and footpaths. In the country therefore there is a tendency for the two sorts of traffic to separate as being mutually antagonistic, but in the towns to combine as being mutually attractive. This is perhaps the *raison d'être* of the wide boulevard of the

continental cities, where ample accommodation is provided for both, the road taking on a composite aspect of both business and pleasure, and being not only the main thoroughfare for traffic, but the main promenade for the citizens, through which they can find not only the shortest way to their destination, but also some pleasure by the way.

It may perhaps be anticipated that as the country becomes still more thickly populated, and as the recent movement towards decentralisation and more even distribution of the population becomes more pronounced, the main roads between large cities will no longer be regarded simply as means of communication, but will be expected to show some regard for those who use them for purposes of exercise or recreation.

CIVIC DESIGN NOTES.

St. Paul's Bridge.

In October, 1911, the London County Council referred back the Joint Report of the Highways and the Improvements Committees, recommending that Parliamentary authority be obtained to carry out the arrangements entered into with the City Corporation. The Committees have now further considered the matter, and have had before them two schemes for linking up the north and south tramways by way of this bridge—one joining Southwark-street with the intersection of Aldersgate-street and Barbican, to cost 1,631,200l.; the other joining Southwark-street with Goswell-road and Old-street, to cost 1,231,200l. The Committees have also considered the suggestion made by the Select Committee of the House of Commons that a new street should be constructed along Great Guildford-street to its junction with Southwark Bridge-road and Marshalsea-road, and find that the additional expenditure would amount to about 370,000l. They consider, however, that from the tramway point of view there is no need for the widening of Great Guildford-street or for the formation of a new street. As the total cost of providing a thorough connection between the north and south tramways from Southwark-street to Goswell-road, including this new street and the provision of cars, car-sheds, sub-stations, etc., would amount approximately to 2,045,200l. by one scheme, and 1,695,200l. by the other, the Committees consider that the additional expenditure render these proposals prohibitive. They have, therefore, decided to again put forward recommendations on the same lines as those already referred back by the Council, and point out that it is desirable that the Council should come to some decision at an early date, so that the City Corporation may not be unduly delayed in making its arrangements for the construction of the bridge.

We have frequently pointed out that, in our opinion, it is a mistake to attempt to connect the north and south tramways by way of St. Paul's Bridge, that the natural route for this purpose is by Blackfriars Bridge and Farringdon-street, and that St. Paul's Bridge should end at the lower level in Queen Victoria-street. It is useless, we suppose, to recapitulate the arguments, but although further reflection only appears to add to their urgency, they seem to carry little weight with the London County Council.

Land Sale at Cooden Heights.

The estate of Sir Augustus Webster, Bart., which adjoins Bexhill, on the high ground to the west, has hitherto been somewhat prevented the development of Bexhill in that direction, as it has been used solely for agricultural purposes, and no part of it was therefore available for building. The portion of the property known as the Cooden Wood Estate, which extends to about 120 acres, is immediately adjoining the quaint old Sussex village of Little Common, and extends from the main Bexhill to Eastbourne road which runs along the summit of Cooden Downs in a southerly slope extending almost to the seashore, and in some places immediately adjoining the first-rate 18-hole golf links of the Cooden Beach Golf Club, recently formed by Lord De La Warr. As will be seen from an advertisement in another part of this issue, 147 lots will be submitted for sale by auction by Messrs. Mabbett & Edge, of Mount-street, Grosvenor-square, London, W., on August 17, at the Kursaal, Bexhill-on-Sea. The lots vary in size from about half an acre to about three acres.

St. Martin's-le-Grand Improvements.

THE proposed demolition of the old General Post Office in St. Martin's-le-Grand is a definite bearing on the question of St. Paul's Bridge, as it affords an opportunity for making provision for the great increase of traffic which may be expected at this crossing, and the tramway tunnel and station which are to be included in the scheme. There are other considerations which affect the question. The Town Planning Committee of the City have approached the Corporation with a view to a new thoroughfare from the end of Newgate-street to Moorgate-street, so connecting with Liverpool-street Station and relieving congestion of the traffic at the Bank. It would have been preferable if the new street were taken a little further north, brought out at Holborn Viaduct, thus relieving Newgate-street also, but, as Mr. Arthur points out, the erection of the new Post Office rendered this impossible. As we understand that the continuation of Newgate-street also considered impracticable, we might have expected the suggestion already put forward in these columns, that such a relief street should be taken from Liverpool-street to Charterhouse-square, and thence to Holborn-circus, to branch from Charterhouse-square to Euston-road. This would relieve the City and form a proper connexion between the three railway termini at King's Cross, St. Pancras, and Liverpool-street.

The Need for a General Plan.

THEN, again, comes the question of the opening up of a General Plan, view of Wren's spire on the Victoria Embankment, in which the Inspector is also interested. This would work into any scheme for forming an open space by connexion with St. Paul's Bridge traffic, and also see it is reported that the Corporation have arranged that the new building on the Office site shall be set back, and that improvements will be made at the entrance to Great street, but, considering the extra traffic to be expected at this spot and the advantage of a new street, it almost seems as if the whole of this site should be given up to create an open space. It is to be hoped that the Office Works and the Corporation will, at any rate, not proceed without taking into account the possible point of view, or without thinking of the needs of the future. The incident illustrates once more the imperative need of a general plan for London to which the improvements at this point can be properly related.

Hertford Castle Grounds.

THE Marquis of Salisbury, having leased this castle to the Hertford Corporation for a term of twenty-five years, has granted an annual rental of half-a-crown, has handed it over by opening some new gates, the grounds provided in a central position for the convenience of the townspeople.

Workmen's Houses.

THE Housing of the Working Classes Committee of the London County Council recommend the erection of 158 cottages and administrative buildings on the western section of the Old Oak Estate at Hammersmith. The cost is not estimated at 42,808l.

Open Space at Shoreditch.

THE grounds surrounding the old almshouses in Kingsland-road, Shoreditch, have been opened for the use of the public. One part of the ground is reserved for games, and a gymnasium is contemplated. A lily pond and fountain have been constructed, and a band will probably play once a week. The old almshouses, built in 1715 with money left to the Ironmongers' Company by Sir Robert Geffreys, are now unoccupied, and will probably be converted into a museum.

New Tube Link.

WHAT Lord Claud Hamilton described as the missing link in the railway chain of London has just been completed. This consists of half a mile of railway extending from the Central London Railway from the London to Liverpool-street, and linking up the London tube system with the Great Eastern Railway. The cost for this half-mile of railway amounted to the formidable sum of 250,000l.

At a recent meeting of the Islington Borough Council a scheme was outlined to give effect to the provisions contained in the will of Mr. Sutton for the housing of the very poor. The trustees, who are dealing with a sum of over 2,000,000, were considering the possibility of purchasing about 4 acres of land in Highbury (Loford House, Highbury) for development as a site for the erection of dwellings under the trusts of the testator's will of expending thereon a sum of over £100,000. The proposal was not to erect block dwellings, but model cottages, with gardens, and housing accommodation for between 100 and 200 individuals. Before applying to the Local Government Division of the High Court it was necessary to obtain from the local authority an expression of opinion as to the desirability of the site in view, and the necessity for further and better housing accommodation for the very poor of the locality. The matter was referred to the Parliamentary Public Health Committee.

We have received the prospectus of the Summer School of Town Planning at Hampstead Garden Suburb, from August 3 to 17, from which it appears that a most interesting and valuable series of lectures will be delivered, and that all

those interested in the subject will do well to be present. The course is planned to be of special value to architects, engineers, and surveyors, but also of interest to all other students of town planning. The fee for the course is 1½ guineas, or single lectures 2s. 6d. each. Application should be made to the Hon. Secretary, The Institute, Hampstead Garden Suburb, London. The inaugural address will be delivered by the Marquis of Crewe in the Institute Hall on Saturday, August 3. In the syllabus, in addition to courses on the Engineering and Surveying problems involved in town planning, will be found a series of lectures on the legal aspect of the subject by Mr. E. R. Abbott, Clerk to the Ruislip-Northwood Council. Professor Adshead will give a series of lectures on "Town Planning in Foreign Countries and Past Times." Mr. Raymond Unwin will lecture and demonstrate on "Town Planning in Practice."

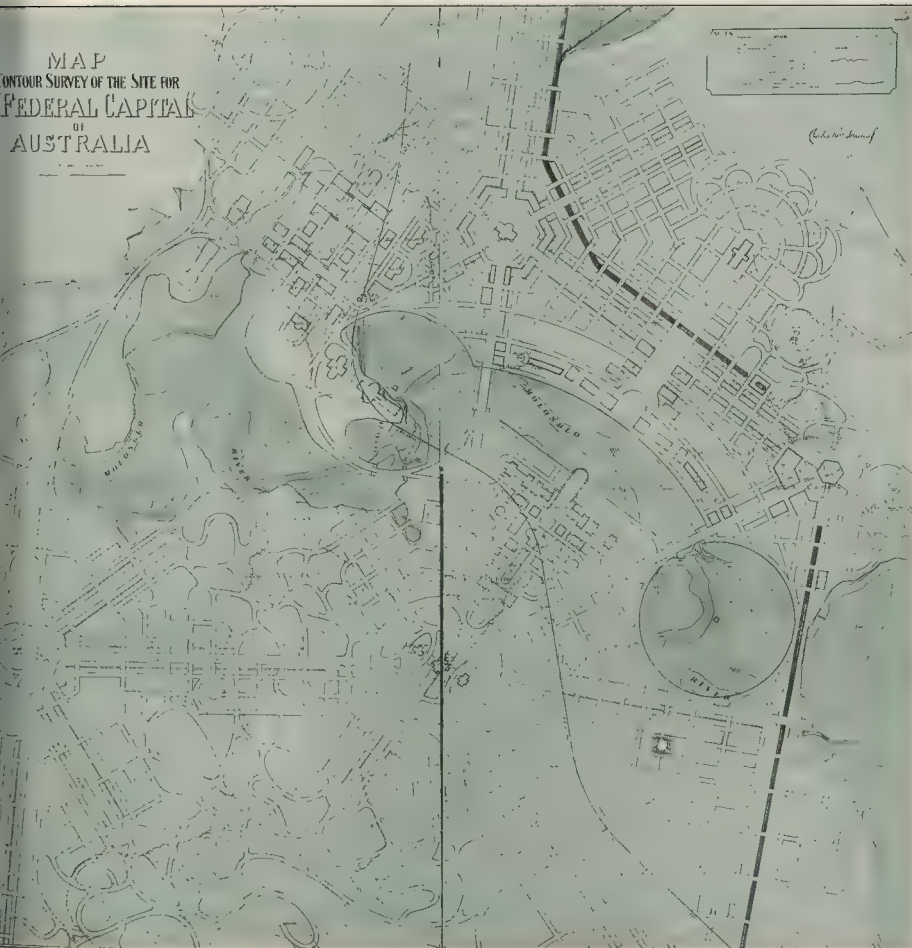

Hastings Castle.

HASTINGS CASTLE having been offered for sale by the Earl of Chichester, whose family have held it since the XVth century, it is to be regretted that the Corporation of Hastings should not have been able to see its way to acquiring it. At the sale last Friday, which was attended by representatives of the Corporation, the property was withdrawn, the reserve price not having been

reached. There is, unfortunately, not much architectural interest in the ruins that now remain; but, apart from their unique historic interest, it certainly seems most desirable that they should be preserved as an open space, and that this site should not be allowed to get into the hands of the speculator. It is to be hoped that the Hastings Corporation will be able to come to terms with the present proprietor.

Australian Federal Capital.

THE competition for the Australian Federal Capital is probably the most important event the town planning world will see in this generation, and everyone must regret most keenly that English architects were unable to compete. The circumstances which led to their exclusion are still fresh in our readers' minds and need not be referred to again except by way of expression of the hope that similar circumstances will never arise in the future. It is natural that we should have wished the prize to go to a citizen of the Empire, but if that cannot be there is none to whom we would grudge it less than to a citizen of the kindred nation which, as was well said at the Institute on the occasion of Mr. Cram's paper, we decline to look upon as foreigners. We have pleasure in publishing a plan of Mr. W. B. Griffin's winning design, which gives the general idea of an admirable lay-out.

Federal Capital City, Canberra: First Premiated Design. By Mr. Walter Burley Griffin (Chicago).

[Photo. "Topical."]

THE BUILDING TRADE.

THE AGREEMENT TO EMPLOY AN ARCHITECT.

OWING to the complex nature of the duties which have to be performed by an architect in relation to a contract for large works, it is essential to define his relation to his employer with a high degree of accuracy. To reduce the terms of the agreement into writing may not be considered essential at the outset. The relations between him and the building owner may be of the most cordial description, but it is the unexpected which often happens. What appears to be prolix and unnecessary in a written agreement may prove to be of the utmost value when a question arises as to the scope of the architect's duties.

If a written agreement is desirable and necessary where the employer is a company or private person, it is doubly so when the employer is a local authority. The members of such a body may be easy to deal with as individuals, but collectively they are ever hampered by having to consider the pockets of the ratepayers. Moreover the personnel of the committee which has works in hand may be continually changing. The conscience of one year may not be the conscience of the next. In these circumstances a certainty of statement appears to be of the utmost importance.

The formal parts which constitute the introduction to an agreement are usually in some such form as follows:—

This indenture made the _____ day of _____ between A. B., of _____, F.R.I.B.A. (hereinafter referred to as the architect), of the one part, and the C. B. Company (hereinafter called the company), of the other part.

Whereas the company are about to procure tenders for the erection of a bonded warehouse at _____

And whereas the company have requested the architect to prepare the necessary drawings and specifications and estimates for the said warehouse, and to superintend the same during its execution, the architect has consented to undertake and to carry out the same.

These are what are known as "recitals" in the agreement. Their object is to set forth as clearly as may be the chief objects which have to be effected by the agreement.

Now, these presents witness that in consideration of the payments to be made to him by the said company at the times and to the amounts hereinafter provided, the said architect agrees with the company as follows:—

Preparation of Drawings.—That he, the said architect, will prepare all drawings, specifications, and estimates of the work necessary for the said warehouse, and alter and amend the same as the company may require, and will take all levels and make all surveys that may be necessary.

While the duty of preparing drawings and specifications is by this clause cast upon the architect, he does not necessarily himself become or render his employer responsible or liable for mistakes or miscalculations to the contractor. As a general rule there is a clause specially inserted in the contract providing that the employer is not to be held responsible for any errors which may appear in the plans and specifications. Sometimes, indeed, the contract contains a clause to the following effect:—"The contractor must also go over the entire line or site of the works, and satisfy himself about all matters relating to the nature of the ground, subsoil, and strata, levels and inclinations, the means of access thereto and egress therefrom, and all other accommodation he may require, the obstacles to the excavation of the trenches, the amount of water to be pumped and diverted, the means to be employed to obtain the necessary flow of any existing water, the amount of haulage, the rights and interests to be, or which may be, interfered with by the construction, completion, and maintenance of the works, and all other matters referred to in the plans and drawings to be seen at the office of the architect, and in the conditions of contract and specification, which may influence

the contractor in making his tender. Difficulties, whether contemplated or not, which may be met with, or happen in the construction, completion, or maintenance of the works, and mistakes in the specification, drawings, or quantities shall not relieve the contractor from fulfilling the terms of his contract, nor entitle him to any extra payment or compensation over the contract amount. The contractor is particularly referred to the contracts between the employer and merchants or manufacturers for the supply of the said materials, and take all risks of delay in such supply."

Notwithstanding this clause, however, it is necessary for the architect to exercise great care in the preparation of plans and drawings, for if it should be found that he has recklessly or carelessly made false statements by words in the specifications or by intentment in the drawings, his employer may be made responsible. For instance, in a case which reached the House of Lords a few years ago, contractors undertook to construct a sea wall to enclose a sewage settling basin according to certain plans and specifications. The plans prepared by the employer's engineer indicated the existence of a certain wall which would have materially assisted the contractors, but, owing to its not being there, they were put to enormous additional expense, which they sought to recover. It was held that, although the contract contained a clause which imposed upon the contractor the duty of verifying measurements, etc., in the plans and specifications, the employers were liable. In giving judgment, the Lord Chancellor pointed out that evidence was adduced at the trial from which the jury might, if they thought right, conclude that the plaintiffs were induced to enter into the contracts by statements made on behalf of the defendants. There was also evidence for the jury that those statements were made either with a knowledge of the falsity, or which was the same thing, with a reckless indifference whether they were true or false on the part of the engineers employed by the defendants to make the plans which were submitted as the basis of the tender. Having referred to the clauses which pointed out that the plaintiffs were not to rely upon the plans, Lord Loreburn said: "Now, it seems clear that no one can escape liability for his own fraudulent statements by inserting in a clause that the other party shall not rely upon them. I will not say that a man, himself innocent, may not under certain circumstances guard himself by apt and express clauses from liability for the fraud of his agents. It suffices to say that, in my opinion, the clauses before us do not admit of such a construction. They contemplate honesty on both sides, and protect only against honest mistakes. The principal and the agent are one, and it does not signify which of them made the incriminated statement, or which of them possessed the guilty knowledge."

Recklessness in preparing plans, etc., may involve loss of fees. In one case a surveyor took no steps to inform himself of the nature of the ground forming the site of the intended works, with the result that he underestimated, and the employer was put to largely increased expenditure. The surveyor was deprived of his fees. Best, C.J., in giving judgment, said: "If a surveyor delivers an estimate greatly below the sum at which a work can be done, and thereby induces a private person to undertake what he would not otherwise do, then, I think, he is not entitled to his fees. I think it is of great importance to the public that gentlemen in the situation of the plaintiff should know that if they make estimates and do not use all reasonable care to make themselves informed they are not entitled to recover anything."

Architect to Advise the Company.—That he, the said architect, will at all times assist and advise the company in all matters relating to the design and execution of the said warehouse.

This clause raises indirectly the question: What constitutes negligence on the part of an architect? Is he to be held responsible for every error in judgment into which he may happen to fall? The principles by which the Courts have always decided the question of

negligence on the part of a professional man on the rare occasions when it has occurred, were laid down in an old case. It was stated that a person who enters into a professional undertaking to bring to the execution of his business nothing more than a reasonable degree of skill and care. He does not undertake to use the highest possible degree of skill. There may be persons who have higher capacity and greater advantages than he has, and he undertakes to bring a fair, reasonable, competent degree of skill. This is the question of negligence for the jury to decide.

Architect to Advise as to Contractor's Superintendence.—That he, the architect, agrees to aid and advise the company in entering into a contract for the execution of the said warehouse and to superintend the work of erecting the said warehouse, and means of such periodical inspections as may be necessary and to report the progress of the work to the company, and to issue certificates to enable the company to make payments from time to time to the contractor or contractors who may be entrusted with the execution of the said intended works, and to assist such contractor or contractors in the said company.

In the matter of superintendence it is important to bear in mind that the architect is not an agent of, and is responsible to, the company who employ him. In the matter of deciding upon the terms of the contract between the employer and the contractor, an arbitrator who cannot be assailed on the decision honestly given; but he may be responsible if he fails to exercise reasonable supervision in the execution of the work. He may perhaps borrow an illustration from the case of an architect which was heard in the House of Lords (1890) 1 F. 1211. In that case the defendant was an architect, employed in the usual way in connexion with a building house in part of which there was to be a basement floor. The foundations for this floor were made of improper materials, with the result that dry rot broke out in the woodwork of the house was completed. The building owner sued the architect for negligence in not passing, as sound, work which was unsound. It was held that the architect was liable, as he had failed to exercise proper supervision, and that it is the duty of the architect to give such supervision as will enable him to certify that the work of the contractors is according to contract. The duty of the architect was thus declared by the Justice Clerk: "He, or someone responsible to him, should undoubtedly see to the execution of the work before they are paid for it, and, if need be, I think he should require the contractor to give notice before an estimate is to be done which will prevent his so doing an important part of the work as to the giving his certificate upon knowledge, and the assumption as to how the work has been done." To enable him to carry out this part of his obligation, the contract for works should contain a clause providing that the architect may, if necessary, which has been closed up to be reopened.

Duty of Architect.—That the said architect will, and he hereby agrees to, exercise reasonable skill and diligence in the discharge of his foregoing duties so undertaken by him, and to act fairly as between the said company and the said company.

This clause is sometimes put in, but it is superfluous. It merely states the obligation of an architect who signs a contract which does not contain the clause. It may, however, be wise to insert it, because it states in plain terms that the architect owes a duty to the contractor as to the building owner, to whom he is to be more immediately responsible.

Remuneration.—In consideration of the due discharge by him of the duties herein taken, the said company agree to pay to the said architect the sum of _____ at the times and in the manner following:—That is to say, one payment of _____ when the contract for the said intended works has been entered into, a second payment of _____ when two-thirds in value of the said

Fig. 1. Fig. 2. Fig. 3. Fig. 4.

Draught-Excluding Door.

have been executed, and a third and payment of £1 within three months the date of the issue of the final certificate to the contractor or contractors for the intended works by the said architect, and that in case the company should decline not to proceed with the said intended works they shall pay to him in consideration for preparation by him of the drawings specifications and estimates sum of 200£., and the said documents thereupon become the property of the company.

As provision is made for payment of the fee to an architect by instalments, he would not wait until the completion of the work he could recover anything. This would be a serious matter in the case of a long and expensive contract. Some provision, too, must be made for the chance of the building owners ceasing to work with the work. In that case the architect might lose all his fees; and he might even lose the plans which had taken much time to prepare and which might be useful in the future.

Arbitration.—And it is further agreed by between the said parties that should any dispute whatsoever arise between them and payment of any sum of money be claimed by the one party and such payment be refused, all such claims and counterclaims, shall be referred to the determination of an arbitrator to be nominated by the president of the Institute of British Architects on the request of either party. Upon and every such reference the cost of and incidental to the reference and award shall be in the discretion of the arbitrator, who may determine the amount of, or direct the same to be taxed as between solicitor and client, or as between party and party, and shall direct by whom to whom, and in what manner, the same to be borne and paid. This submission shall be deemed to be a submission to arbitration within the meaning of the Arbitration Act, 1889.

The witness, etc. Arbitration clause is now common form in agreements between architects and their clients. The clause does not oust the jurisdiction of the Courts, but it has the effect of enabling either party to prevent the other from proceeding with an action. For instance, if the architect were to sue for one of the clients due to him. The building owners issue a summons to stay the action on the ground that there was an arbitration clause, and a decision of an arbitrator upon the matter would be a condition precedent to the action. If, however, the employers allowed the action to proceed, the Courts would entertain the action and give judgment upon it.

A NEW "DRAUGHTLESS DOOR."

An age of haste the various patterns of draught doors now in common use are somewhat adversely commented upon because they are through them is a matter involving a more trouble than attends the mere pushing of an ordinary large door. Those who are in the habit of using them would be willing to use a draught door if one existed having the same advantages. There is sometimes a more important point, when for purposes of "panic" or other reason an absolutely free opening is required. In the ordinary types of revolving draught door an arrangement is usually made for a crowd to pass out by either allowing all the flaps to open upon a central line parallel to the line of passage or by temporarily shifting

the doors and pivots completely to one side. Almost invariably there is some preparation required if it be desired to use the full width of opening for the continuous passage of many people in one direction.

Mr. Le Croissette has devised an "inter-leaved" door which, though not yet upon the market, appears promising from each of the points of view above indicated.

The door consists of six leaves, and its action is illustrated (diagrammatically only) by the figures above. Fig. 1 shows the normal position of the leaves, each of which has a width equal to about two-thirds of the opening. A person passing from either side simply pushes the nearest of the leaves blocking the opening. If he passes in the direction of the arrow the leaves take successively the positions shown by Figs. 2 and 3, and, so soon as released from the hand, they return to the normal position shown in Fig. 1.

If, however, it is a panic-stricken crowd that demands passage, the return to normal position is not made; the continued pressure will open the last pair of doors into the position shown in Fig. 4, from which also they automatically return unless it be desired to keep them open, when all that is needed is the use of an ordinary bolt.

The action of the doors is the same in either direction. The mechanism is simple, and is fixed above the soffit of the door casing. It is claimed for the doors that by avoiding shaped joinery they effect a saving in cost, that an absolutely unobstructed exit is automatically secured in case of panic, that the absence of curved wings reduces the chance of a crowd getting jammed in the opening, that there are no projections from the floor to cause tripping, and that they act with equal freedom in either direction.

BUILDING PLANS AND BUILDING PROSPECTS.

The quarterly return of building plans submitted for approval by 100 of the urban districts, exclusive of the County of London, published in the *Labour Gazette* still show decreasing activity. As compared with the same quarter last year, the estimated cost shows a decrease of 104,694£., or 2.5 per cent. The second quarter of 1911 showed a decrease as compared with the same quarter in 1910 of 356,143£., so a decrease again follows already diminished expenditure. In this second quarter of 1912 all classes of buildings show a decrease except factories and workshops, in which there is a large increase of 550,549£., but as stated above, the decrease in other classes of buildings has more than wiped out this increase. This increase takes place only in Lancashire and Cheshire, the Midlands and Ireland. The decrease in dwelling-houses is 20.9 per cent., and occurs in all districts except Scotland and Ireland. In Scotland the increase is large, 39,353£., but in Ireland under 100£. The rumours of fresh taxation of land values are likely further to depress the building trade.

STRIKE OF BUILDERS' LABOURERS IN MANCHESTER AND SALFORD.

About 3,000 builders' labourers in Manchester and Salford and district are on strike. They demand a minimum wage of 7d. an hour. A few of the firms not in the Employers' Association have acceded to the demand, and the Co-operative Wholesale Society has effected a compromise by which their labourers, numbering 400, are to receive 6d. an hour for the present and subsequently a further increase should it be agreed to between the Employers' Association and the general body of strikers.

UNEMPLOYMENT INSURANCE CONTRIBUTIONS.

AS SOME misapprehension appears to exist on the matter, the Board of Trade wish to make it known that no stamps can be used for payment of contributions in respect of Unemployment Insurance other than the special Unemployment Insurance stamps, which are obtainable at any post-office. Health Insurance stamps and ordinary postage stamps cannot be used for the purpose, and, if affixed, do not count as contributions in respect of Unemployment Insurance. Where such other stamps have been affixed, it will still be necessary for the proper Unemployment Insurance stamps to be affixed, and the liability for affixing them rests upon the employer.

For the present, however, as a temporary arrangement, and with a view to facilitating the correction of mistakes, the Board of Trade will themselves be prepared, without charge, to affix Unemployment Insurance stamps in lieu of the Health Insurance stamps wrongly affixed, obtaining the employer's acknowledgment. For this purpose all unemployment books to which a Health Insurance stamp or stamps have been wrongly affixed, should, as soon as possible, be sent to a divisional office, with a request for the affixing of Unemployment Insurance stamps of value corresponding to the Health Insurance stamps upon them.

The addresses of the divisional offices are as follows:—

London and South-Eastern—Caxton House, Westminster, S.W.; South-Western—Canada House, Baldwin-street, Bristol; West Midlands—164, Corporation-street, Birmingham; Yorkshire and East Midlands—14, Frenchgate, Doncaster; North-Western, Lancashire, and Cheshire—Cairo-street, Warrington; Wales—Law Courts, Cathays Park, Cardiff; Scotland and Northern—Bath-street, Glasgow; Ireland—21, Parliament-street, Dublin.

MASTER PAINTERS AT CHESTER.

IN connexion with the Convention of the National Association of Master Painters and Decorators at Chester in September, an Exhibition of Decorative Art and Manufactures relating to house decoration will be held. The Association has put in the forefront of its endeavours the importance of training the young men engaged in the trade to an appreciation of the beauty of their craft. A carefully-graded scheme of education is drafted for the apprentices, commencing with boys for the first two years of their apprenticeship, which forms one section. Another section is for boys under eighteen in the middle period of their apprenticeship, and a third section is for boys in the last period of their training. The curriculum embraces plain painting in all three grades, as good, sound painting is the basis of the painting trade on which all other work is built, and the Executive attach great importance to boys being soundly taught in this part of their work. Another section common to the three grades is that of lettering and sign-writing. The arts of graining and marbling, stencilling, stencil-cutting, and lining are common to the two higher grades, and the senior division has more advanced studies set them in sketch-book studies, coloured original designs for interior decoration, and a time test for ornamental painting, so that it will be seen that a large and instructive field of work is covered.

For young men out of their time, up to the age of twenty-five, the Association has, in conjunction with the sister associations of Scotland and Ireland, established a Travelling Scholarship of the annual value of 50£., realisable in Italy. This year the competition falls due at Chester.

GOVERNMENT CONTRACTS.

The following tenders have been accepted by the Government Departments named:—
Admiralty Works Department.—Two concrete storage tanks for water, H.M. Dockyard, Rosyth.—Messrs. W. & J. R. Watson, Ltd., Iona-street, Edinburgh. **War Office.**—Pontoons.—Messrs. J. Stewart & Son, Ltd., Blackwall, E.; works services: additions and alterations to heating system, Alexandra Hospital, Colham.—Messrs. Ashwell & Nesbit, Ltd., 17, Great James-street, Bedford-row, W.C.; conversion of quartermaster's stores to sergeants' mess, Richmond Barracks, Dublin.—Messrs. McRoberts & Armstrong, Lower Windsor, Belfast; erection of additional store at air battalion offices, Aldershot.—Mr. J. Crockerell, Stanhope Lines, Aldershot; erection of annexes to married quarters, Reading.—Messrs. Boshier, Sons, & Co., Chelsey, Berks; erection of annexes to married quarters, Woolwich.—Messrs. Thomas & Edge, Anglesea-avenue, Woolwich; erection of Barrack Block, Dover Castle.—Messrs. G. E. Wallis & Sons, Ltd., Broadmead Works, Maidstone; erection of gymnasium, Castle Park Barracks, Dunbar.—Messrs. W. Finlayson & Sons, Pilrig Works, Balfour-street, Leith; periodical works services at Belfast.—Messrs. A. Bagnall & Sons, Ltd., Shipley, Yorks; Colchester.—Messrs. E. Fearnley & Sons, Trafalgar Works, St. Jude's-place, Bradford; Strensall.—Messrs. A. Bagnall & Sons, Ltd., Shipley, Yorks; Woolwich (No. 1).—Mr. S. Kendall, 6, Byram-street, Huddersfield; (No. 2).—Mr. T. Carr, 55, New Crown-street, Cardiff; repair and maintenance of War Department buildings at Bristol.—Messrs. E. Walters & Son, Ltd., Montpellier, Bristol; repair and maintenance of War Department buildings at Cardiff.—Mr. J. Thomas, Mardy-street, Cardiff; sinking borehole and erection of pumping plant, etc., Aviation School, Salisbury Plain.—Messrs. Duke & Ockenden, Ltd., Ferry Wharf, Littlehampton; supply and erection of portable hangars, Larkhill.—Mr. W. Harbrow, South Bermondsey Station, S.E. **India Office, Store Department:** Bridgework.—Messrs. Dorman, Long, & Co., Middlesbrough; Messrs. Brandon Bridge Building Company, Motherwell; tiles.—Messrs. Carter & Co., Albert-embankment, S.E. **Crown Agents for the Colonies:** Steel bridgework.—Messrs. Horsehay Company, Ltd., Horsehay, R.S.O. **Salop:** cement—the British Portland Cement Manufacturers, Ltd., 4, Lloyd's-avenue, E.C.; roof for station.—Messrs. Wm. Bain & Co., Ltd., Lochrin Ironworks, Coatbridge, N.B.; carriage, goods, and engine sheds.—Messrs. J. Lysaght, Ltd., St. Vincent Ironworks, Bristol. **Office of Works:** Builder's work, adaptation of Birmingham Labour Exchange.—Mr. J. E. Harper, 76-80, Lombard-street, Birmingham; Liverpool Labour Exchange and Divisional Clearing House.—Messrs. Haugh & Pilling, Watmough-street, Liverpool; additional story at General Post Office, South.—Messrs. Howell J. Williams, Ltd., 11-17, Bermondsey-street, S.E.; plumbing and drainage work at Sofa Legation.—Messrs. Davis, Bennet, & Co., Westminster. **Sanitary Works,** Horseferry-road, S.W.; renewal of boundary fencing, Regent's Park.—Messrs. Bayliss, Jones, & Bayliss, Ltd., 139-141, Cannon-street, E.C.; joinery work at Sofa Legation.—Messrs. Galbraith Brothers, Ltd., Camberwell-green Works, S.E.; road rolling and scarifying, Royal Parks.—Messrs. Chittenden & Simmons, Ltd., Bank-buildings, Maidstone. **General Post Office:** Laying lines of ducts in Holborn and St. Pancras.—Mr. J. A. Ewart, 21, Old Queen-street, S.W.; laying lines of ducts in High Holborn and New Oxford-street, W.C.—Messrs. Greig & Matthews, 35, Queen Victoria-street, E.C. **Metropolitan Police:** Clearing police site at Arlington-road.—Mr. F. Keen, 469, Old Kent-road, S.E. **Commissioners of Woods:** Laying on water from Hartwell to, and providing a reservoir at, Saley Lawn, Northants.—Messrs. Rowell & Sons, Chipping Norton, Oxon; new cottages for Parish Council, Bromham, Wilts.—Mr. H. Webb, Bromham, Chippingham, Wilts. **Commissioners of Public Works, Ireland:** Decoration of National Gallery, Dublin.—Mr. J. Hubbard Clark, 7, Eden-quay, Dublin.

PETERSFIELD ARGUMENTED WATERWORKS.

A Local Government Board Inquiry was held by Mr. P. M. Crosthwaite, M.Inst.C.E., on the 23rd ult., into an application by the Urban District Council of Petersfield to borrow the sum of about 2,000l. for extending the watermain into the Rural District, and the provision of hydraulic motor and steam pumping plant, and the construction of a ferro-concrete reservoir of 95,000 gallons capacity, etc. Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of Newcastle-upon-Tyne and Birmingham, are the engineers. There was no opposition.

GENERAL BUILDING NEWS.

NEW CHURCH, BRISTOL.

This church is being erected from the designs of Messrs. Gough & Sons, architects, at an estimated cost of 10,000l. The contractors are Messrs. R. F. Ridd & Sons, and the foundation-stone of the building was laid on July 20 last.

CHURCH HALL, HEWORTH.

A new church hall and school is being erected at a cost of about 1,400l. from the plans prepared by Mr. C. S. Errington, architect, of Newcastle. The hall is 54 ft. by 30 ft., and the builder is Mr. William Foster, of Pelaw.

TRADE NEWS.

Under the direction of Mr. David Henry, architect, St. Andrews, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air-inlets, has been applied to Strath Kinness Public School, Strath Kinness, Fife.
 Messrs. D. Anderson & Son, Ltd., have been awarded the certificate of the Institute of Hygiene for their "Marosa."

The Imperial Picture Palace, Oldham, is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

PROPOSED NEW BUILDINGS IN LONDON.

Princess Club, Bermondsey, S.E.; Mr. A. W. West, architect, 3a, Lyall-street, Belgrave-square, W.; Messrs. J. Garlick, Ltd., builders, 43, Sloane-street, S.W. School, Highfield-road, Winchmore-hill, N.W. (9,967l.); Messrs. Mattock Brothers, Winkfield-road, Wood Green, N. Additions at schools, Upton Park, E. (1,000l.); Mr. R. M. Locher, Clerk, Guardians' Offices, Raine-street, Old Gravel-lane, E. Laundry, Kensal-road, Paddington, W. (2,280l.); Mr. E. B. B. Newton, Surveyor, Town Hall, Paddington. W. Rebuilding shops, showrooms, etc., Coventry-street, W.; Mr. F. G. Minter, builder, 49, Lacey-road, Putney, S.W. Alterations to shops and flats, Streatham-common, S.W.; Messrs. W. H. Lorden & Sons, 107, Trinity-road, Upper Tooting, S.W.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Deviation from Certified Plans.

Rotherhithe.—Proposed rebuilding of the "Royal Oak" public-house, abutting upon Tooley-street and Morgan's-lane, Bermondsey (Mr. E. Faux for Messrs. Courage & Co., Ltd.).—Consent.

Spaces at Rear and Alteration of Buildings.

Chelsea.—Alterations and additions at Nos. 171, 173, and 175, Fulham-road, Chelsea (Messrs. R. W. Price & Sons for Mr. G. Dancocks).—Consent.

Cubical Extent.

Chelsea.—Additional cubical extent in respect of a warehouse building upon a site abutting upon Pavilion-road, Charlotte-street, and Cross-street, Chelsea (Mr. C. W. Stephens).—Consent.

Woolwich.—Erection of a building exceeding 250,000 cubic ft. in extent, to abut upon the eastern side of Hardens-manorway and the northern side of Westfield-street, Woolwich (Messrs. Siemens Brothers & Co., Ltd.).—Consent.

Lines of Frontage and Projections.

City of London.—Illuminated sign at No. 108, Cannon-street, City (Sir Joseph Canon & Sons, Ltd.).—Consent.

Hammer-smith.—Erection of a building upon a site on the eastern side of Rowan-road and the southern side of Brook-green, Hammer-smith (Mr. D. Watson for the Governors of St. Paul's Girls' School).—Consent.

Hammer-smith.—Addition at the rear of No. 14, Shepherd's Bush-green, Hammer-smith, abutting upon Richmond-gardens (Mr. W. A. Burr for the London County and Westminster Bank, Ltd.).—Consent.

Holborn.—Two external iron ladders and a landing and handrail at Nos. 6, 7, and 8, Harpur-mews, Holborn (Messrs. Fuller, Horey, Sons, & Cassell).—Consent.

Kensington, South.—Projecting illuminated sign in front of No. 70, Kensington High-

street (Messrs. O. C. Hawkes, Ltd., for Mr. Ledger & Sons & Co.).—Consent.

Lewisham.—One-story shop in front of 55, Brookley-rise, Lewisham (Mr. A. J. R. for Miss I. Adam).—Consent.

Lewisham.—Erection of three projection buttresses to the Sandhurst-road front of the public library, Torridon-road, C (Mr. E. Van Patten for the Lewisham A. M. B. C. C. (Metropolitan Borough Council)).—Consent.

Marylebone West.—External wooden case at the rear of No. 5, Abercorn-place, Marylebone (Mr. J. Myers).—Consent.

Norwood.—Erection of bay-windows, porches and oriel windows to two houses or southern side of Sudbourne-road, Brixton (E. Green).—Consent.

Rotherhithe.—Erection of a one-story ing in front of No. 106, Jamaica-road, monsey (Mr. A. W. West).—Consent.

St. George, Hanover-square.—Additional closures to the existing porch in front of 27, Belgrave-square (Mr. A. N. Prentice for the Right Hon. Lord Greville).—Consent.

Wandsworth.—Erection of a parish hall, the northern side of Garratt-lane, Wandsworth (Messrs. Hoare & Wheeler).—Consent.

Width of Way.

Finsbury, Central.—Building abutting Aylesbury-street and Jerusalem-passages, Finsbury (Mr. J. B. Gridley for Messrs. E. P. & Co.).—Consent.

Greenwich.—Retention of boundary line at less than the prescribed distance from centres of streets on the southern and western sides (Mr. A. Griffin).—Refused.

Hackney, South.—Erection of an addition to a mission building on the northern side of High-street, Homerton (Mr. J. S. Alder for the Rev. Stanley Power).—Consent.

Norwood.—Cinematograph hall upon the No. 135, Dulwich-road, Dulwich (Mr. Harris for Mr. E. Jackson).—Consent.

Width of Way and Space at Rear.—**Newington, West.**—Bathroom addition to the rear of "The Ship" public-house, ington Butts, near St. Hubert-place (Mr. W. Bradford & Sons for Messrs. T. Walker, & Co., Ltd.).—Consent.

St. Pancras, South.—Addition at the rear of No. 34, Guilford-street, Russell-square, abut upon Lansdowne-mews (Messrs. Jos. Smith).—Consent.

Width of Way and Construction.

City of London.—Erection of external balconies at Nos. 7, 8, and 9, Bartholomew-close, City (Mr. W. F. Young).—Consent.

Lewisham.—Temporary iron motor shed at Preston Lodge, on the western side of Trevelyan-road, Lewisham, and the erection of two sheds at the rear of such (Messrs. J. Bennett & Co.).—Consent.

Width of Way and Line of Frontage.

Finsbury, Central.—One-story addition to Nos. 1 and 3, St. James's-walk, Clerkenwell, near St. James-place (Messrs. Tasker & Wright for Mr. E. J. Penny).—Refused.

Formation of Streets.

Clapham.—Formation or laying out of street for carriage traffic to lead from the northern end of Edgely-road, Clapham (H. G. Blackmore).—Refused.

Fulham.—Formation or laying out of streets for carriage traffic in continuation of Peterborough-road, Carnwath-road, and Hugon-road, Fulham (Mr. H. E. Kinto for Mr. J. Meares).—Consent.

The recommendations marked + are contrary to the views of the Metropolitan Board of Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Weaving mills for Mr. Richards, Ltd., Ann-street (5,000l.); Mr. Wilson & Walker, architects, 181a, U. street, Aberdeen.

Aberdeen.—Warehouse for Messrs. North Brothers, cotton spinners, Brook Adington.

Amersham.—Isolation hospital; Mr. Hilsdon, Surveyor, Rural District Council; architect to be appointed by petition.

Ayr.—N.B.—Weaving shed, etc., M'Clellan (1,800l.), for Messrs. W. C. G. Sons, carpet manufacturers, Ayr.

Bearpark Colliery (Co. Durham).—S. (3,000l.); Mr. W. Rushworth, Architect, H.L., Durham.

Bedford.—Discut factory, London-road, Messrs. Peak, Frean, & Co., Bermondsey, W.

Brierley.—Forty houses for the Hol Colliery Company; eighteen houses for

* See also our list of Competitions, Contests, etc., on another page.

The Roque Canal, to prevent the annual floods which have hitherto devastated a large area in the province of Matanzas, has been commenced. It is to be from 25 yds. to 60 yds. wide, and from 2 ft. to 15 ft. deep, and will cost 500,000, and it is to be completed within three years.

A concession has been granted to the Palmaira and Cruces Electric Railway and Power Company to utilise the waters of the Humana River for the supply of power to a plant. All machinery, tools, and rolling stock. All employees will be admitted free of duty. The company will build a standard gauge railway 225 miles long in Santa Clara province, passing up sugar and tobacco lands, and probably he five miles in building. Further, a concrete dam 1,000 ft. long and 75 ft. high, will be built for the storage of water. The capital of the company, which will claim no subsidies, is 4,000,000. Plant to develop 10,000 horse power will be installed. Light and power will be taken to the towns and sugar mills on its route.

MILAN AND COMO CATHEDRALS IN DANGER.

We learn that the façades of these two cathedrals are in a dangerous condition, and are considered by experts likely to collapse at any moment. The façade to Milan Cathedral was added by the first Napoleon to the XVIIIth-century edifice, who, as though realising that his power was to be of only short duration, insisted on the work being carried out with the greatest dispatch.

This, as was only to be expected, resulted in jerry building, and the great cathedral had tacked on to it a mass of unselected marbles, some so soft that twenty years after erection decay had set in, and then commenced periodical patching and clamping. Thus the hybrid Renaissance binnacle to a noble Gothic cathedral became more and more an eyesore, and for the last half-century many schemes have been proposed by the civil authorities for demolition and the erection of a façade more in harmony and keeping with the ancient Gothic structure.

A few years ago a scheme for reconstruction was actually approved by the Government, but conflicting expert opinion and public opposition rendered it inadvisable to proceed further. The prospect of a collapse has, however, now become so grave that it has been resolved to demolish the upper part of the façade immediately. It is estimated that the work of demolition will occupy four months.

The Como Cathedral, whose front is one of the best examples of Lombard architecture, is also in danger of collapse. The front, constructed of black and white marble, has been gradually bulging outwards for nearly a century, and at present one portion is nearly 3 ft. out of the perpendicular. Commissions have from time to time been appointed, and money—not inconsiderable in amount—has been expended in expert consultations, but no effective result has come of it all, and the money expended to no purpose. Perhaps at last something will be done now that the façade is likely to come down of its own accord without the permission of the powers that be, seeing that it is likely to bring down with it a large portion of the cathedral nave, to which it is attached by metal clamps.

QUESTIONS IN PARLIAMENT.

In the House of Commons on July 25 Mr. Goldsmith asked the Hon. Member for St. George's-in-the-East, as representing the First Commissioner of Works, whether there has been any increase in the clerical and architectural staff of the Office of Works since January 1, 1907, and, if so, whether he can state the additional number of officials employed. In reply, the Lord of the Treasury, Mr. Wedgwood Benn, said that the increases in the staff since January 1, 1907, have been as follows:—seventy-nine clerks, five architects, and eighteen assistant architects. Mr. Goldsmith then asked whether, in view of the fact that the annual expenditure of the Office of Works is 2,500,000, he could state how much of this sum has been spent on new buildings during the past financial years and how much on repairs.

Mr. Benn: The total amount spent by the Office of Works on new buildings, including the cost of certain sites, during the year 1911-12 was 822,476, and on maintenance and repair, 587,868.

Mr. Goldsmith again asked what was the amount of new work, excluding repairs, executed to the design of the Office of Works since January 1, 1907, and what is the amount of salaries paid in connexion therewith.

Mr. Benn: The expenditure upon new works executed to designs prepared in the Office of Works for the five years ending March 31, 1912, has amounted to 4,066,945. The total payment for salaries, etc., for the same period is 464,493, but a large proportion of this is for services not connected with the construction of new buildings.

Mr. Goldsmith: Is it a fact that the whole of this work has been done by the architect of the Office of Works, and that outside architects are never consulted and their designs never adopted?

Mr. Benn: No, sir. The statement of the Hon. Member is inaccurate. At least four modern public buildings have been carried out by architects not connected with the Office of Works.

On the same day Mr. Goldsmith asked the

President of the Board of Agriculture whether the design which has been adopted for Oxford-circus is to be continued for the remainder of Regent-street as far as the Quadrant, whether any scheme has been laid down for the rest of the street, and, if so, whether he could state the name of the architect selected. In a written reply, Mr. Montagu, speaking on behalf of Mr. Runciman, stated that a design had been approved for the Oxford-circus and the adjoining frontages along Regent-street as far as the first cross street on each. No one scheme has been laid down for the rest of the street. Between the termination of the Oxford-circus design and the Quadrant the street is divided into separate blocks by side streets and for several of these blocks designs by various architects acting for occupying tenants have been settled and in part executed. Mr. Goldsmith then asked whether Mr. Tanner's design for rebuilding Oxford-circus was selected by an open competition, and, if not, what system was adopted. Mr. Montagu, in a further written reply, said that Mr. Tanner's design was not selected by an open competition, but from designs submitted by several architects acting for tenants occupying premises in the Circus.

In the House of Commons on July 26 Mr. Newman asked the Chief Secretary to the Lord Lieutenant of Ireland if he is aware that an inspector from the Local Government Board, in Ireland, reported, with reference to the Tralee Rural District Council's cottage scheme, that of the 107 cottages contracted for up to January, 1910, ninety-nine had been proceeded with up to the date of his report, and that out of the ninety-nine cottages proceeded with thirty-seven were not in accordance with the drawings and specifications, that only thirty out of the sixty-two cottages conforming to the plans had the kitchen floor of tiles or flags, as specified, and that only twenty-five cottages had the window-sills of stone, as specified, and that out of the ninety-one occupied cottages forty-seven fire-places or chimneys, in the living-room were defective, that in seventy-seven cottages occupied or in the course of construction the floor levels were too low, and that in sixty-five of the examined cases the mortar used was bad and the masonry defective, that in twenty-four cases the mortar was worthless, that in twenty-nine occupied or completed cottages the walls were either damp or wet, and that the damp walls were partly from the use of bad mortar and partly from bad masonry work, and might also be partly attributed to the defects in the construction of the cottages, and if he will state how the matter now stands and what the Local Government Board propose to do in the matter. Mr. Birrell, in a written reply, stated that the facts were as stated. The local engineer under whom the works were carried out, and who had been in ill-health at the time of the architect's inspection, has since died, and the Rural District Council have entrusted the completion of the scheme to a competent engineer of considerable experience of this class of work, who, it is expected, will take special care to secure the completion of the cottages in accordance with the approved plans and specifications. Further inspections of the cottages will be made from time to time by the architects of the Local Government Board as the works progress.

THE BRITISH FIRE PREVENTION COMMITTEE TESTS.

THE British Fire Prevention Committee commenced its two-day summer meeting on Wednesday last week at its Regent's Park Testing Station with some high temperature fire tests on a reinforced concrete floor and on six sets of electro-glazed casements. The testing operations were conducted by Sub-Committees under the general direction of Mr. Ellis Marsland (General Hon. Secretary).

The arrangement of the reinforced concrete floor test has awakened considerable interest, as it is the first occasion that a floor of this type reinforced solely with a mesh reinforcement (a triangle mesh) has been under official review, and the question of whether for such floor with mesh reinforcement a lesser amount of protective covering would suffice is a much-discussed problem from the fire point of view. Again, the arrangement of the test with electro-glazing of the so-called "Chadrac" type has awakened much interest, seeing that the "Copperlite" type was recently tested and obtained a very high record, and that other

makers are also testing to the same standard.

The testing operations on the second day were in the hands of Mr. Ellis Marsland (General Hon. Secretary), Mr. Bertram Chadrac (Chairman of the A.M.Inst.C.E. (Insurance Surveyors)),

The fire tests were with three sets of glazing casements of the Luxfer type, fixed by a test with a double door constructed of reinforced concrete, this latter hailing from Belgium, where it had been constructed to specifications of the Chairman of the Government Fire Committee, and had been over for report.

The arrangement of holding tests on consecutive days was considered a great advantage inasmuch as it made it more convenient for members and representatives of authorities from the provinces specially visiting London, and it is to be anticipated that this arrangement will be followed in future years. The following are results of tests:—

Some of the official "short results" of testing operations at the British Fire Prevention Committee's Testing Station on July 21 have now been authorised for issue. They are summarised as follows:—

The 22-ft. by 15-ft. reinforced concrete door, with "triangle mesh" reinforcement, and admitted by the United States Steel Pipe Company, of London, obtained classification affording "Full Protection" (Class B), four-hours' fire test at temperatures ranging up to and above 1,800 deg. Fahr., followed by the application of water from a steam engine (through two branches) for five minutes, the floor being under a load of 2½ cwt. per super, during the test. This is the first time having this method of reinforcement submitted to official fire test in England and to attain high classification.

The double reinforced concrete door, submitted for test by the Chairman of the Government Fire Committee, obtained classification affording "Full Protection" (Class A) on a two-and-a-half-hours' fire test at temperatures ranging up to and above 1,800 deg. Fahr., followed by the application of water from a steam fire-engine (through one branched five minutes).

The "Chadrac" electro-glazing of window submitted for fire test by Messrs. Joseph & Sons, in panels of 2 ft. by 2 ft., and shown in a panel of 4 ft. by 3 ft., obtained the classification affording "Temporary Protection" (Class B) on a one-hour fire test at temperatures up to and above 1,500 deg. Fahr., followed by the application of water from a steam engine (through one branch) for two minutes. This is the first occasion of so large a panel of electro-glazing of 8 ft. super. having attained this classification.

The results obtained in the remaining tests with "Chadrac" electro-glazing and "Luxfer" prism electro-glazing will be announced later.

Further Tests.—The Committee announced that the reinforced concrete floor referred to above will be submitted to an additional test over and above the Committee's standard requirements by the application of a load after the subsequent cooling of the test, and that among the next tests will be a test with a non-flaming celluloid known as "Celcon", the first product of this character to be submitted to the Committee's official fire test.

THE WIDENING OF KINGSTON BRIDGE

AFTER much delay the projected widening of Kingston Bridge is within measurable distance of realisation, the tender for 64,230, of Messrs. Water, Scott & Middleton, Ltd., of Manchester, having been recommended for acceptance in respect of the constructional details after plans and designs prepared by Mr. Mott, C.E., whose estimate was for 70,000. The Surrey and Middlesex County Councils acquire the land necessary for the new wider approaches at the two ends of the bridge. This improvement will be a very great advantage, as at present the constricted way is too narrow for ordinary traffic, and nothing of translines. The present bridge, comparatively recent date, having been built in 1825 from designs by Mr. Lapidge, but has been a bridge at Kingston from very times, and much of the old-time importance of the town was due to its possessing a bridge above London. Tradition asserts

during his campaign with Cassivelaunus, bridge about half a mile before the present one, but this was probably only a temporary for military purposes, as, according to Cassius, there was only "a ford of stepping-stones" when Aulus Plautius landed in Britain in 43.

The next few centuries are somewhat shadowy, but it is not until the early Saxon period that we hear of a bridge again, and then it is made of a bridge on the site of the old one, which, however, suffered so much from Danish incursions that at the beginning of the 11th century it was reconstructed near the present bridge, and this one was in existence till its condemnation and destruction in 1828. During its long life it was a constant source of anxiety to various wardens, and in the records we find over and over again of the state of the bridge and of the money expended for its repair.

The bridge was vested in three bridge-wardens, and then one, and in 1376 the structure was handed over to the bailiffs of the town for a term of fifty-one years, with permission to let the tolls for ten years to the repairs were evidently necessary, as the lease was then gone "to ruin and decay." Grants of property "for repairs to the bridge" are also frequent. In 1565, Robert Hammond, of Hampton, made over some of an annual value of 40*l.* to the bridge, and from tolls for all time; in commemoration whereof a tablet was placed on the bridge, thus inscribed:—

"1565.

Robert Hammond gentleman
Bailiff to Kingston heretofore
He then made this bridge
Toll free for evermore."

After floods and rough usage, the old fabric was taken down in 1812, when it was condemned. The history of Kingston, published by a Mr. Mason in 1818, the bridge is thus described:—"The bridge in its present state is an airy structure of timbers, so inartificially put together as would warrant us in pronouncing whatever changes it hath undergone in its life there hath been no deviation from the plan on which it was originally built; the sters, which are more than twenty in number on each side, occupy the space of a third and twenty-five yards, exclusive of forty yards of masonry employed at the ends."

From early times the bridge used to be a place of punishment for "scolds," or brawling women, and accounts are extant for a ducking, a whipping, stool, made and used in 1572. The keys, too, of the old bridge used to be kept to the Mayor of the town after they were locked up on Sunday morning, his practice lasted till 1690.

The existing bridge was commenced in 1825, and opened three years later, and its principal dimensions are as follows:—Total length, 1,147 ft.; water-line, 334 ft.; height of centre 24 ft.; span, 60 ft.; width of road and way, 25 ft. 6 in.

There are five elliptical stone arches and two brick arches for flood water. The cost, including approaches, was 40,000*l.* This was a bridge until 1870, when the gates were removed and the tolls abolished.

THE LONDON COUNTY COUNCIL.

At the usual weekly meeting of the London County Council was held on Tuesday in the City Hall, Spring-gardens, S.W., Lord Somers, Chairman, presiding.

Finance.—The Finance Committee recommended that loans be made to Borough Councils as follows:—Camberwell, 9,166*l.* for paving works; Lambeth, 14,500*l.* for paving works; Newington, 3,250*l.* for paving works, and 1*l.* for electricity plant; Battersea 7,808*l.* for electricity undertaking; Hammersmith, 1*l.* for paving works; Shoreditch, 2,546*l.* for street improvements; Woolwich, 6,000*l.* for electricity undertaking, and 3,250*l.* for paving works.

Factories and Fires.—The Chairman of the Factories Committee, in replying to a motion, stated that 964 factories in the City were notified to the Council; 841 had been visited with a view to means of escape in case of fire, and 123 were under consideration.

Theatres, etc.—The following drawings have been approved by the Theatres and Music Halls Committee:—Battersea Palace of Varieties—new operating enclosure and improved means of ventilation of the dressing-rooms; Coronet Theatre—proposals for complying with requirements relating to sanitary and ventilating arrangements; New King's Hall, 133-139, Commercial-road—extension of premises; Princess Hall, 120, Commercial-road—re-arrangement of doors and alterations to office; Shepherd's Bush Empire—re-arrangement of seating in stalls and pit and alterations to exits and lavatory; Sydenham and Forest Hill Public Hall and Skating Rink—alterations to seating and exit arrangements.

Cinematograph Halls.—Drawings have been submitted in respect of new cinematograph hall proposed to be erected at No. 11 to 14, Salisbury-street, Jamaica-road, Southwark, and for proposed alterations to Mornington Hall 13, Canonbury-lane, Islington.

Adjournment.—The Council has now adjourned for the summer recess, and the next meeting will be held on Tuesday, October 15.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of this Council, on July 25, the following matters were dealt with:—

Orange-street Baths.—Subject to certain conditions, it was decided to let the remainder of the Council's lease in the above baths to Mr. T. Davis, of Cooks-in-street, who proposes to convert the premises into a cinematograph theatre, and expend between 4,000*l.* and 5,000*l.* on the site.

Sewers and Drains.—The receipt of a communication from the Camberwell Borough Council was acknowledged, asking the City Council to support the Standing Joint Committee in endeavouring to secure in the next session of Parliament an amendment to the law relating to combined drainage. It was agreed to inform the Standing Joint Committee of the Metropolitan Boroughs that the Council were in favour of an amendment to the law, but were unable to decide whether to contribute to the cost of promoting a Bill before seeing a draft of it.

District Surveyor's Charges.—It was decided to support the Southwark Borough Council in calling the attention of the London County Council to the excessive fees which District Surveyors are allowed to charge under the scale fixed by the London Building Act, particularly for minor alterations in large buildings.

Australian Commonwealth Buildings.—Consent was given, subject to conditions, for the proposal for the drainage of the new Australian Commonwealth buildings in Aldwych.

METROPOLITAN WATER BOARD.

At the monthly sitting of the Metropolitan Water Board on Friday, the following matters were dealt with:—

Southwark Bridge Offices.—The tender of Messrs. J. Greenwood, Ltd., of 563*l.* was accepted for fire-protection work at the Southwark Bridge-road offices.

Enfield Supplies.—An estimate of 4,564*l.* was approved for the necessary works for providing a supply of water to Botany Bay, Enfield.

Future Supplies.—It was agreed to sanction an estimate on capital account of 1,650,200*l.* for the acquisition of land and construction of two reservoirs at Littleton, with the necessary buildings, etc., and to take steps for inviting tenders for the same; and also to incur an expenditure of 30,000*l.* in the provision of new works at Shortlands, Kent.

METROPOLITAN ASYLUMS BOARD.

The following matters were dealt with by the Board at its fortnightly sitting on Saturday:—

Joyce Green Hospital.—It was decided to carry out repairs to roads at the above hospital at a cost of 950*l.*

Laundry Works.—Plans were submitted for alterations and extensions of the laundries at Joyce Green and Long Reach Hospitals, estimated to cost 1,200*l.*, and these were approved.

Works.—The following tenders were accepted:—For cleaning and painting works at the Darenth Industrial Colony, Mr. L. Kazak, 1,739*l.*; for cleaning, painting and repairs at

the head office, Messrs. W. J. Simma & Sons, Nottingham, 953*l.* 11*s.* 9*d.*; for alterations to heating service, etc., at Long Reach Hospital, Messrs. G. N. Haden & Sons, 540*l.* 10*s.*; cleaning and painting at the Belmont Laboratories, etc., Mr. W. Hussey, 339*l.*; cleaning and painting works at Queen Mary's Hospital, 3,039*l.*; cleaning and painting work at the smallpox hospital, Mr. L. Kazak, 2,219*l.*; cleaning and painting works at White Oak School, Mr. J. W. Billingham, 780*l.*; sinks, etc., at North-Western Hospital, Messrs. B. Finch & Co., 499*l.* 10*s.*; work in connexion with ferro-concrete tanks and water-softening plant at Darenth Industrial Colony, Messrs. J. Garrett & Son, 2,270*l.*

LEGAL COLUMN.

Arbitration in Building Contracts.

The case of Colborne v. Chairman and Members of the Council of Llantrisant, reported in our columns last week, shows how undesirable it is for builders to accept contracts containing an arbitration clause which does not provide for an entirely independent person acting as arbitrator. The contract in question related to the erection of a caretaker's office and other works for the defendant Council. The work was to be done on plans and specifications prepared by the Surveyor to the Council, and also to the approval of the Surveyor in his capacity as Surveyor. The Surveyor had objected to the stone used, and a dispute had arisen, the allegation being that to conform with the contract the building would have to be pulled down and rebuilt. Very naturally in this state of affairs the builder felt it would be useless to go before the Surveyor as an arbitrator to have the very points in issue decided by him, and he brought the action in question. The Court stayed the action on the ground that the arbitration clause applied. There was nothing, Lord Justice Fletcher Moulton observed, to show that the Surveyor had performed his duties unfairly or illegally, or that he would fail in exercising his functions as arbitrator.

The case really illustrates the folly of entering into contracts which contain an arbitration clause practically appointing one of the parties to the contract arbitrator. The Surveyor to the Council was their servant in their pay, and owed a duty to them. That duty would prevent him from exercising the functions of an independent arbitrator—at any rate, to the satisfaction of the plaintiff. This fact must have been apparent to the plaintiff when he entered into the contract, if only from the Scriptural dictum that "no man can serve two masters," yet he chose to accept its terms.

The case will be of service if it draws attention to the senselessness of accepting such terms in building contracts, and, we believe, the practice of appointing a representative of one of the parties as arbitrator is practically confined to building and engineering contracts. In other business relations such a practice would be deemed an absurdity, and the stress of competition does not entirely account for its adoption by builders and contractors. A study of the "Law Reports" will show that apart from the unsatisfactory nature of the tribunal so created, litigation is nearly sure to arise as to whether, where parties have consented to the appointment of an arbitrator, who, from the very nature of his duties, cannot be an impartial arbitrator, the person appointed to fill this very difficult position has acted in any way so as to disqualify himself.

Workmen's Compensation: Liability when Orders Disobeyed.

The recent case, Parker v. Hambrook, decided by the Court of Appeal, is one of importance to employers. Where a man deliberately disobeys orders, and in consequence suffers an injury which causes death or serious and permanent disablement by sect. 1, subsect. (2) (c) of the Workmen's Compensation Act, 1906, the legislation, as we think, most inadvisably, has deprived the employer of the defence that the injury is due to the workman's serious and wilful misconduct, and enables the workman or his dependants still to recover compensation. Since this Act was passed, numerous cases have arisen in which workmen have sustained injuries or been killed in consequence of disobedience to orders, and in place of the defence of serious and wilful misconduct, more complicated considerations have arisen in determining whether the employer was liable or not.

In the case under consideration a workman was employed in a quarry getting flints. There was in the quarry a deep trench known to the employer to be dangerous, and the workman was forbidden to get flints from there. The

flints were more easy to get there, and the workman, in defiance of orders, went to the trench and was killed by a fall of earth. The Court held that in so doing he was acting outside the sphere of his employment for his own benefit, and his dependants could not recover compensation. In this decision the Court were following the case of *Wiegill v. South Hutton Colliery Company* (the *Builder*, September 15, 1911), where a man engaged to hew coal in one place, in defiance of instructions, went to another place and was killed, and his dependants were held disentitled to compensation because he was acting outside the sphere of his employment. If a man, however, acting within the sphere of his employment, disobeys orders, most difficult considerations arise.

In the case of *Harding v. The Brynddu Colliery Company, Ltd.* (the *Builder*, September 15, 1911), a collier was being employed to drill down into a working to allow gas to escape. The lower working was boarded up in accordance with special rules made under the Coal Mines Regulation Act, to show it was unsafe, and this intimation was understood by the miners. The drilling twice missed the lower working, and the man asked leave to enter the lower working, which was refused. He nevertheless went, and was suffocated. The majority of the Court of Appeal held that although this was serious and wilful misconduct, yet as the man was carrying out the operation for which he was engaged the accident arose out of and in the course of his employment, and his dependants were entitled to compensation. Lord Justice Buckley disagreed, and held that the sphere of this man's employment was to do a particular act at a particular place, and that he was out of that sphere when he left that place, and his motive in going had no bearing upon the question. This appears to us far the most logical reasoning, and to avoid much hardship under the Act. Take, for example, a builder who places at the disposal of his workmen plant suitable for every purpose and of good quality, and expressly forbids his employees to do a job with improper appliances. A man, instead of using a ladder, makes a temporary erection out of a barrel and other material, and meets with an accident. He was only carrying out the object he was employed for, and had no motive in doing what he did except to save himself trouble. Wilful misconduct he was guilty of in disobedience to orders, but, according to the finding of the majority in the Court of Appeal in *Harding's* case, the accident arises out of the employment, and compensation is payable.

It would surely be far more logical not to look at what the man was engaged to do solely, but also to consider what are the necessary risks he is called upon to take in performing the task he undertakes. If a man performs his duty in an improper way, he himself adds a risk not within the scope of his employment.

It is to be regretted that *Harding's* case was not carried to the House of Lords, for there are dicta in the case of *Barnes v. Nunery Colliery Company* (the *Builder*, January 5, 1912), which indicate that the Lords incline to the principle we have just indicated. In that case a boy met with his death by riding on a corve contrary to orders. Lord Loreburn said: "An arbitrator has to ask himself, was the injury by accident caused by something reasonably incidental to the employment, by some risk to which a workman, liable like other men to be careless and take short cuts, might be exposed in doing what he had to do?" The headnote to this case in the "Law Reports," which summarises the effect of the judgments delivered, is: "That the death was caused by an added peril, to which the deceased, by his own conduct, exposed himself, and not by any peril involved by his contract of service."

If the above rule were rigorously applied, we cannot but think that much litigation would be avoided, and that it would also tend to secure obedience to reasonable rules. It does not exclude the workman from claiming compensation, where he has merely been careless in the execution of his work, as in the case of *Hopgood v. Olive Parfittington Ltd.* (the *Builder*, July 2, 1910), but only where he adds an unforeseen risk to his employment, as, for instance, by working in an unauthorised place with unauthorised materials, etc.

Before leaving this subject we may draw attention to the curious result attained by the provision as to serious and wilful misconduct in the Act of 1906. In the House of Lords, in the case of *George v. Glasgow Coal Company* (the *Builder*, December 5, 1908), a miner who, contrary to rules, had opened a door leading to the cage before the cage stopped, was held to have been guilty of serious and wilful misconduct, and not entitled to compensation: but in this case, although he had had a

serious fall, by luck, he had not been seriously and permanently disabled. Had his injuries been serious, on any rule laid down by the cases, his employers would have been liable, as the accident occurred within the sphere of his employment. It is surely ridiculous that the employer's liability should depend upon the nature of the injuries sustained.

The Metropolitan Water Board.

Despite the high charges which have been the cause of so much complaint, the Metropolitan Water Board is confronted with a large deficiency, and the Special Committee appointed to inquire into how this should be dealt with has just issued its Report, which has been adopted. The apportionment of any deficiency under the Boards Act is to be levied upon those urban and borough areas as are for the time being entitled to be represented on the Board. The Committee do not suggest that this immunity from the deficiency rate enjoyed under the Act of 1902 by the rural districts not represented on the Board should be disturbed, but their proposals are that the deficiency rate shall be levied, not upon the rateable value of the premises supplied in each district, but according to the revenue derived from each district, and that this should include revenue derived from the supply for both domestic and non-domestic purposes.

The Committee state that if these proposals are accepted no alteration will be necessary in the Charges Act of 1907.

The Charges Act has repeatedly been characterised in the Courts as an unsatisfactory measure, and in many respects a reprehensible measure. It has necessitated an enormous amount of litigation and involved hardship and expense to many consumers of water, that necessity of life. If the Board have to apply for special legislation we can only hope that an amendment of the private Act will be insisted upon by Parliament.

Insured Persons: Contracts of Service.

In view of the uncertainty which exists as to what classes of persons are within the compulsory provisions of the Insurance Act, two cases brought before the Courts should be noted.

In the first of these, *re "Employment of Ministers of the United Methodist Church and Ministers under Probation of the Wesleyan Methodist Church"* (the *Times*, July 12), ministers and probationary ministers appointed by the Conferences of the churches, but paid by the Circuit, were held not to be employed under a "contract of service." The Court held that, even if such persons were employed at all, it would be difficult to find who were the employers, and the distinction noted in a case under the Workmen's Compensation Act, *Simmons v. Heath Laundry Company*, between a contract of service and a contract for services, was also recognised, and the ministers were held not to be employed under a "contract of service."

The second case, *re "Employment of Curates or Assistant Curates in the Church of England"* (the *Times*, July 27), both classes of curates were held exempt on the ground that they held ecclesiastical offices, and are not engaged under contracts of service, any obedience given to the Rector or Vicar being given to him as an ecclesiastical superior and not by virtue of any contract.

Seeing the difficulty the Courts experienced under the Workmen's Compensation Acts in determining what was exactly meant by a "contract of service," it seems really extraordinary that the Legislature could not have devised some clear definition of the classes intended to be compulsorily included in the Insurance Act.

LAW REPORTS.

KING'S BENCH DIVISIONAL COURT.
(Before the LORD CHIEF JUSTICE and Justices DARLING and PHILLIMORE.)

A Builder's Conviction: Rule Granted.

On Friday, July 26, the Court granted an application made on behalf of Mr. Hollidge, a builder of Uxbridge, for a rule nisi for a writ of *certiorari* to the Uxbridge Justices, calling upon them to show cause why they should not bring up a conviction recorded against Mr. Hollidge to be quashed.

Mr. Corthorpe Munro, Counsel for the applicant, said proceedings were taken against Mr. Hollidge by the Rural Sanitary District Council for an alleged contravention of the bye-laws in connexion with a building line. When the

summons was being heard Mr. F. M. M., the Chairman of the prosecuting Council, naturally had an interest in the proceedings, and sat on the Bench with the Court. Although he did not retire with them to consider the decision. There were authorities governing the point, and, in spite of that Mr. Elgodd did not retire. Justices, the fact that he sat on the Bench during the hearing of the summons was sufficient to justify the Court in setting aside the conviction, by which Mr. Hollidge was fined 40s. and 10s. costs. Counsel, pointing out, said Mr. Elgodd, during the hearing, glanced and smiled at various parties connected with the prosecution.

The Lord Chief Justice: But surely does not matter.

"If you are right," said Mr. Justice more, "one of these days it will be as a magistrate, when interested in the must not be in Court at all, or even it must not be within a hundred yards place."

The Lord Chief Justice: And, above must not smile.

Mr. Munro: In a case of this kind he not to have been on the Bench at all, was really one of the litigant parties.

The Lord Chief Justice said the rule be granted that the matter could be ventilated.

LONDON COUNCILS.

Brentford.—The Guardians have as the tender of Mr. W. J. Dickens, Esq., £2201, for carrying out extensions Works and Laundry.

Croydon.—The following tenders have accepted by the Education Committee: George Lewin, Sydenham-road North, don, alterations and improvements to Norwood School, 968l. 4s.; Mr. Edward Tamworth-road, Croydon, heating apparatus, 42l. 7s. 6d.; G. Goldsmith & Sons, Ltd., Whitehorse Croydon, heating apparatus, Boston handicraft centre, 41l. 2s. 6d.; the Flooring Company, Victoria Park, S.E. block floor at Boston-road handicraft 42l. 7s. 6d.

Croydon (Rural).—The District Council passed plans lodged by Messrs. Doby for the erection of three pairs of houses at Smitham Bottom-lane.

Hammersmith.—A loan of 3,678l. is taken up from the London County Council for the reconstruction of the works to the period of repayment being seven years. Upon a portion of Duane-road being widened it has been decided to have the road met and paved as a new street. Plans have been lodged with the London County Council by E. Matoham for the reconstruction of a Queen-street and the erection of a palace upon an adjoining site.

Hornsey.—The tender of Messrs. Stone, Sons, Muswell Hill-road, at 546l., has been accepted by the Education Committee for carrying out structural alterations at North Harrington School, as has also tenders of Messrs. Watkin & Son, Wood at 64l. 7s., for extending the heating apparatus; and at 22l. 1l. 6d., for similar at the Highgate and Campbourne Schools.

Hord.—The following plans have passed:—Mr. S. W. Bedford-Trow for a Fountain, three houses, Birkbeck-road; Mr. Howards & Sons, building at Uphall; Mr. C. U. Gurney, removal and re-erection of Baptist church and schoolroom, Cameroe.

Islington.—A letter has been received from the Borough Council from Messrs. Lamb, France, 17, Ironmonger-lane, E.C., notifying that the trustees under the will of the late Mr. W. B. Sutton, who left a sum of 2,000,000l. for the erection of model dwellings for the poor in London and elsewhere, are considering the desirability of purchasing about four acres of land in Highbury (L. House, Highbury Park) for development site for the erection of dwellings for the under the trusts of the testator's will, extending thereon a sum of over 50,000l. The proposal was not to erect block dwellings, but model cottages, some to be on the main principle, i.e. to contain two separate dwellings, one above the other, with garden, afford housing accommodation for between 400 and 600 individuals, or about 109 separate tenements. At a recent meeting of the Council it was decided to refer the matter to the Parliamentary Committee with instructions to inform Messrs. Lamb that the site proposal was unsuitable, but asking them to convey and forward to the Committee alternative sites.

LONDON COUNCILS.—continued on page 157

Measures Office. Plan and specifications and information from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester. Deposit 10s. 6d.

ON COUNCILS—continued from page 156.

Uxbridge.—The Joint Committee of the Councils of Middlesex and Surrey, appointed to consider matters as to the Hampton and Kingston Bridges, reports having received tenders for the widening of Kingston Bridge, which was estimated to cost £1,500. Tenderers were invited to give quotations for foundations to be constructed partly on land and partly by cofferdam, and (b) for the bridge to be constructed wholly by the "a" scheme, whichever might be decided by them on the recommendation of the Engineer, Mr. Basil Mott. The Railways Committee of the County Council has decided, subject to certain conditions, to give intimation that they are prepared to purchase 5,333 super. yds. of land at the corner of Village-road and Rush Hill-road, Green, to enable the Metropolitan Electric Tramways, Ltd., the lessees of the site, to carry out an undertaking, to provide a car shed accommodation. Subject to assent of the Board of Education, additional land is to be carried out at the Ashford School at a cost not to exceed £1,500. **Worthing.**—The Master of the Workhouse was instructed by the Guardians to prepare a plan of a building for isolation and to report further as to the modification required and the site proposed within the town. **Worthing.**—Application is to be made to local Government Board for sanction to borrowing of £5,000, the estimated cost of paving with grey Royal sets the margins of the tramway track in Hoe-street. **Worthing.**—The footway on the south side of portion of Eton-road is to be relaid with Portland slabs paving at an estimated cost of £1,000. Electricity mains are to be extended to the estimated cost of 1900. The London County Council are to be urged to take immediate steps to complete the widening of High-Eltham, in order that the Borough Council may proceed with the wood paving throughout. In the event of the Council refusing to take such action, the Corporation is to be proceeded with immediately. The tender of Mr. J. W. Elling-Broadway, Bexley Heath, has been accepted at 357l. for the erection of a canopy and tramway shelter at Abbey Wood. have been passed for Mr. J. J. Bassett, Marlborough-road, Eltham, on behalf of Lord Ellen, for the erection of four houses in Eton-road, Eltham.

No. 1 "BB."

This latest type of "Ideal" Sectional Boiler combines all other advantages of the "Ideal" construction with the greatest facilities for firing and clinkering, provided the new double doors which give free access to every part of the fire and grate.

Ideal No. 1 "BB" Boiler showing new double doors.

IDEAL & IDEAL

RADIATORS & BOILERS
For warming houses, flats, hotels
shops, public buildings, etc.
by hot water or steam

Ideal "BB" Series Boilers are at present made in sizes for 710 to 1,435 feet of 4-inch pipe—can be supplied with smoke outlet at front or back—are specially suitable for horticultural work.

Full particulars, prices, and measurements gladly sent on request.

We supply Valves, Tools, Registers, Ventilators, Pipe Fittings—all accessories required for Low Pressure Hot Water and Steam Heating.

Catalogues gratis and post free.

ONE of the greatest difficulties and discouragements that beset the way of the architect as artist-constructer is the lack of public interest in and appreciation of his work. I do not propose at the moment to discuss at any length the causes of this state. Probably they might be largely traced up in the fact that most people are too busy trying to earn a living, or to make a fortune, to leave much time for the arts, which have come to be regarded as luxuries or hobbies unless used as a means of the former all-important duty. We speak generally, of course, of full knowledge that there are, and there have been, many exceptions, and there is at last some promise on all sides of an awakening from this apathy to the arts for their own sake, and not for but utilitarian purposes. The idea of beauty and amenity in all things, so long being mere useless and expensive luxuries, is but one phase of normal human life, and that it may pay a considerable dividend none the less realisable incoaleable in cash, begins to dawn on itself; so far, indeed, as to have itself recognised even in an important measure by Parliament.

Architects, and all who love their art, may take heart of grace, and may also remember that it is not only architecture that has been treated with public neglect and indifference. The machinery and powers of local government have developed greatly within the last twenty-five years; yet public interest in their exercise by County, District, and Parish Council still lags behind, sometimes exhausting itself at election time, or confining itself to scrutiny of the rates. But even here breath is entering into the dry bones, sporadically as yet, it is true, but with promise of fuller life to be.

The diversion of interest from the æsthetic to the mechanical arts, in the rush for material and commercial development ensuing upon the industrial revolution, affected architecture with the rest. From the XVIIIth century to the present time, though there have never been wanting men capable of distinguished work, it has remained an arrested tradition, expressing little of a momentous epoch beyond something of its spirit of restless individualism and experiment, showing itself, at the best, in short-lived recapitulations of past phases. The greatness of the XIXth century was

In other things, and it is quite conceivable that no more stable or consistent architectural expression was possible of a period so essentially mechanical, so rapidly transitional, preparing the way perhaps for a synthesis of knowledge, a social reconstruction and a Renaissance of art greater than any history can show us. That architecture has its part in the awakening, the enthusiastic and sound work already done for education is alone sufficient to show, apart from other signs.

But, good as that work is, there is one respect, and that a fundamental one, in which, as we ventured to suggest in a former article, we think it is still wanting. As a result largely of its arrested tradition and the growth of the idea of art as of something distinct from the rest of life, the public are still too prone to think of and treat architecture as something added to building, a decoration depending only upon certain abstract principles and the use of certain traditional forms of beauty, rather than a spirit pervading building, expressing truly not only the purpose of the building and its construction, but something also of the life of our time, individual or corporate, with its joys,

needs, problems, aspirations, and ideals. If architecture is to have this quality, for which no academic rules can be laid down, the architect, whatever his archaeological scholarship, his attainment in the schools, his power as artist, must have knowledge of human nature and life in its manifold environment to-day, so different from that of the Athens of Pericles, of Rome, Florence, Medieval or Elizabethan England, or even of the early XVIIIth century. Knowledge of all these is good—probably essential. Or of our Saxon ancestors, rough-hewing town and village, and their institutions; or of primitive man struggling to shape his environment. But all must be studied with a view to the complex facts and conditions of our present civilisation, for it is that only we have to express.

In the article mentioned we spoke of the inadequacy of present general educational methods in the twin aims of bringing out and development of character and of practical efficiency. We alluded to a growing educational movement, which is destined possibly in its extension and completion to re-integrate in itself the divided aims of the traditional culture and the modern commercialism. For "town study," in the widest sense, comprehends practically all life activities and culture in correlation and co-ordination. Through the agency of advanced and thoughtful educationalists and teachers it is entering the schools as a method incidental and illustrative of special studies, or directly as a special subject. The latter is adopted with young pupils, beginning with cardinal facts of immediate environment and extending, with their capacity, to every possible aspect of the town's existence; from geographical beginnings, and consequent occupations and industry, to the present time; its people and great men and women; its legends, traditions, annals, customs, and institutions; its monuments, buildings, art, and art treasures; its literature, its communications—from the track through the waste to electric railway, from coracle to liner, and so on. And all these in complex interaction and relation. The method is by direct observation and interpretation to arouse real interest and care for the facts and things of the town. Teaching is given in such ways as to encourage intelligent self-activity and learning by doing, such as the collection of facts, the making of drawings, models, photographs, etc.; or, while tracing the development and interplay of industrial processes from earliest beginnings, in the actual making of such simple implements or products as may be practicable.

Such objective teaching, it is clear, must increase the interest and understanding with which young architects will take up their more advanced and abstract studies in civics, or the sciences, or arts. In so far, also, as it necessarily involves an elementary knowledge of architecture and its intimate relation with all the other factors of the town it would be a means of selecting those who might with advantage take up special studies therein.

A distinct general interest is evident in the present town-planning movement, and the building up of that interest into

a sound and well-informed public opinion is essential to its ultimate success. This is a matter of vital concern to architects, and none should be so fully qualified as they to inform and lead public opinion. The objects of town planning are the objects of architecture on the widest scale, and though comparatively few architects may be called upon to lay out a town extension, or garden suburb, or village, every architectural work is or should be an integral part of the town plan with its proper relation to the rest. But if architects are to lead it must be by the exposition of a broader view than that shown in the discussion of such academic questions as of formal or informal treatment, or of this, that, or the other style for the buildings. Laymen, as a rule, are little able to appreciate such questions, but are quite capable of forming some opinion upon general matters of health, convenience, or amenity in the town. The architect may show that these objects of town planning also broadly express those of architecture; that as the town is, in the fullest sense, spiritual as well as material, a nodal point of ways to and fro the ends of the earth, a receiving house, workshop, and exchange for all that Nature and man's activities of hand and brain produce and shape for the nourishment of human life that does not depend on bread alone, so every building worthy to be called architecture has its component part to play in the service and interpretation of life.

Thus it has seemed to us that town study—which, by the way, is evidenced in other directions than in the educational movement referred to—is of far-reaching importance and promise, not only in arousing public appreciation of architecture, but also in its suggestiveness in the education of the professional student. Its value is in its correlation and co-ordination of things too much separated hitherto; of the past with the present, the town with the country, of different orders of cities and towns, of the sciences, of science and art, and of the subordinate arts and crafts with the generalised art of architecture. The architecture of the past would no longer be studied in isolation from the other factors of the life of which it was the outcome, nor applied as an abstract art in conditions essentially different and more complex. Studied and applied it must continue to be, as embodying and beautifully illustrating enduring principles common to all true architecture. But while the principles remain the forms must change and pass, and, from whatever style or styles we may start as most fitting, it cannot but happen that in the broader, more living culture that will come of a fuller knowledge and interpretation of our modern life, architecture will again gradually acquire that common character we call style, which will be consistent with that life and culture. Whether or not architects unite themselves in some great guild, architecture will again become a common cause, not limited to the ranks of the profession or a cultured few outside, but finding inspiration and appreciation alike in the awakening of a wider, social, and æsthetic interest.

THE CELLULOID FIRE MOOR-LANE, E.C.

AS we stated in our last issue appeared advisable to any detailed comments on this disaster until the conclusion of the Coroner's inquest. Verdict being now given, we propose to consider those features of the case which seem of chief importance, especially those having a bearing upon dealing with factories in which celluloid is handled.

It will be useful at the outset to refer to the general arrangement of the building in which the fire occurred. It occupied one floor only, the fifth and topmost of No. 21, Moor-lane, E.C., a building similar in nearly every respect to hundreds of others in its immediate neighbourhood. There is one staircase only, leading from the street to the fifth floor, and used in common by the tenants of the various floors; this staircase has winding treads at various levels and is enclosed by wooden partitions. It is not an ideal fire-escape stair, but is supplemented by specially constructed means of escape towards the rear premises on each floor. The position of this stair is shown on the sketch of the roof and top floor, reproduced with, upon which is also indicated a stair to the roof and the special landing or balcony at the fifth-floor level. Upon paper these means of escape are ample, and probably would have been had the employees been active men only, or had the material caused the disaster been of a moderately or slowly inflammable nature. But the material was exceptionally dangerous qualities, and gave rise to quite young girls who were the cause of no chance of correcting their first-stricken error.

In looking at the ruins, as in looking to the evidence at the inquest, one is struck with the vital importance of the element of time in connexion with our Fire Brigade well realises how often hangs upon the saving of a few seconds at the commencement of a conflagration, and it is only just now for men to note here that the escape route extended against the Moor-lane fire building within two minutes of the first ignition of the building by the sealing-wax door upon it. That this escape failed to save life was because the flames were so fierce that the upper part of the building was immediately fired, and Mr. Yardley, who went up it as soon as it was placed, was therefore unable to reach the top. Nevertheless, the back of the premises is not very far from the approach, the Brigade confined the fire not only to the building but to one floor upon which it broke out, and it well under control in twenty minutes from its start.

It is evident from the aspect of the ruins, apart from the other proof of the heat of the fire, though of great intensity, was of relatively brief duration for the comparatively flimsy rafters of the roof boarding below the slating by no means destroyed, and support a considerable part of

Especially one noted the con-
le area of slating still remaining
the gable end of the building at
t where thirteen girls out of the
who worked in the back room were
with fatal results to nine and
to three of the others. There
plaster ceiling or soffit to the
nd in view of the fire-resisting
s of plaster it is possible that
ceiling would have checked the
a few minutes, with life-saving
It would be not unreasonable
ire such plastering under wooden
n existing buildings of this kind.
ing this we recognise, of course,
ordinary glass skylights form a
proportion of the roof the flames
quickly find a vent, and then any
on the roof would stand but a
lance, even if the non-glazed parts
"fireproof." This difficulty could
actively met by using properly-
wired glass.

There was one omission in the means
ape actually provided which was
triking to anyone reaching the top
fire-escape staircase and taking
glance around the roof; this was
sence of any handrail to guide and
confidence to the girls in passing
he roof of No. 21 to that of No. 23.
Illustration shows, there is a drop
6 in. across a gap 16 in. wide to
rotiated in the passage to the flat
ne long dormer window at the back
23. This drop, with the sight of
ljoining deep area, or light court,
which a slip in jumping might
itate her, would certainly make
any girl hesitate. In the present
with fierce flames to the right, this
ard and unguarded jump in front,
ed more terrifying by flames from
scape window, and a clear gutter
a solid though low brick parapet
left, it is not to be wondered at
each one rushed in panic along the
—to find it terminating in a dead

end from which return was almost
instantly cut off by the bursting of the
flames through the skylight shown at D
on the plan. Such a handrail as we
suggest would not make a burglar's task
easier than it now is, and it would very
likely have led these poor girls to rush
along a comparatively safe path instead
of the one they actually took.

Yet, while such suggestions as the above
may point to reasonable means of render-
ing some existing buildings safer, it is
clear that they cannot remove the great
risk involved in the use of light wooden
construction for workshops in which cellu-
loid is handled, nor can they make a con-
fined space at the top of an ordinary City
building a safe home for such a business.
The material, while not explosive in the
ordinary sense, is, as might be expected
of a member of the guncotton family,
inflammable to an extreme degree.
Flame will leap along loose pieces of thin
celluloid with a speed approximating
to that which it shows in passing over
loosely scattered gunpowder, and pre-
cautions adequate enough in a carpenter's
shop, with the usual supply of shavings,
are by no means sufficient in the case of
celluloid. The use of sprinklers, which
would probably suffice to keep under a
fire starting among wood shavings,
would be quite ineffectual in the case of
celluloid. Messrs. Angus Thomas's
manager and Mr. Morris, Fire Brigade
Divisional Officer, agreed that when once
a considerable amount of celluloid caught
fire practically nothing would put it out,
and "the lightning-like rapidity with
which flames spread amongst celluloid"
(to quote Major Cooper-Key, the Home
Office Inspector) is such that the presence
of sprinklers would probably lead to an
added danger by giving a suggestion of
protection which the result could not
justify.

The handling of this most dangerous
material should be carried on only in
workshops arranged with a care approxi-

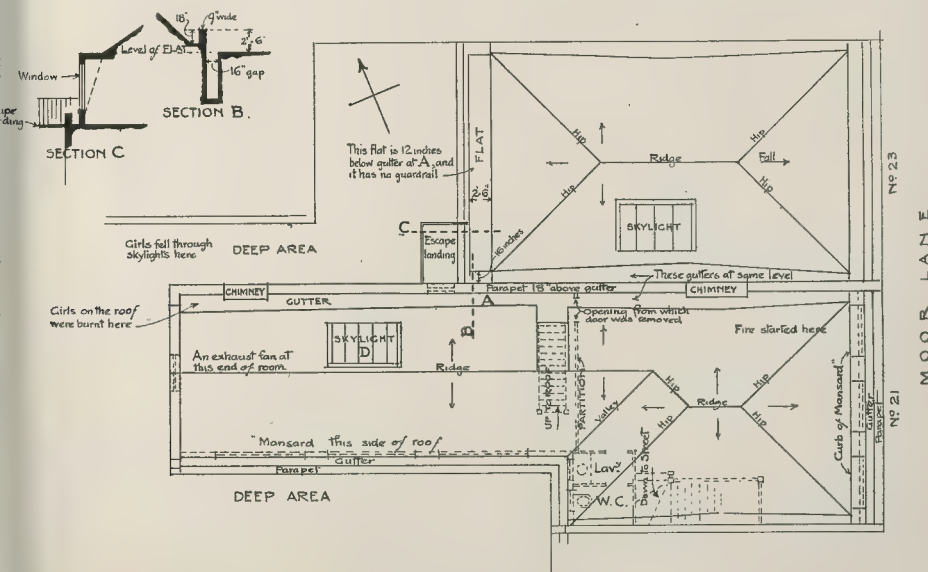

mating to that with which a cinemato-
graph operating chamber is now planned.
In all new buildings in which celluloid
in appreciable quantity is to be dealt
with, fire-resisting construction may
reasonably be asked for, and if long
workshops are needed they may generally
be divided by fire-resisting partitions, so
arranged that one room may be more or
less isolated from the remainder. As
an alternative, if one large room be
necessary, it should be arranged so that
the workers could run away from their
work to the exits without passing through
any narrow passages between the in-
flammable material, the general idea
being that when once celluloid is alight
it must simply be left to burn itself out.

Another point to which attention was
drawn during the inquest was the question
of storing as distinct from working the
celluloid. There was a weight of about
1,500 lb. of celluloid upon the Moor-lane
premises, of which 1,000 lb., in piles
about 6 ft. or 7 ft. high, was in the room
in which the fire broke out, and this was
ignited so quickly that the twenty-two
people in the front room, with two who
were in the act of passing from the back
to the front when the fire started, had
only just time to escape by the stair to
the street, and the thirteen girls in the
back room were at once cut off from
every exit but that to the roof.

Colonel Fox expressed the view that
a manufactory and a store should be
quite distinct, and we most strongly
agree with him. Even should it be im-
practicable to remove all such factories
to appropriately constructed buildings,
it must surely be possible to make this
separation.

As a result of the whole inquiry it may
be said:—

(1.) That celluloid should be dealt with
as an exceptionally dangerous substance,
ranking in that respect second only
to absolutely explosive materials and
petrol.

Scene of the Fire at 21, Moor Lane, E.C., July 23, 1912. The Means of Escape.

(2.) That the storage of the material in bulk should not be permitted in workrooms.

(3.) That all new buildings for use as celluloid stores or workshops should have their walls, floors, ceilings, partitions and roof glazing of fire-resisting materials.

(4.) That where old buildings are permitted to be used all soffits and partitions of timber construction should be plastered, no matching or panelling being allowed, and that properly-fixed wired glass should be required to all skylights through which the passage of flame would endanger a means of escape.

(5.) That celluloid is best dealt with in buildings removed from towns and having free means of escape at more points in proportion to the floor area than is usual in other factories.

(6.) That in cases where a town site is unavoidable, and a part only of a high building is used, it is desirable, in view of the large volume of flame given off by burning celluloid, to place the factory at the top of the building, to minimise risk of fire spreading to other buildings. Celluloid does not send out large showers of burning fragments such as would be likely to fire the roofs of other buildings.

(7.) That the store provided for celluloid in bulk be, if in a town, constructed with only small windows of wired glass and a skylight, the latter so arranged as to form the outlet for flame in the event of fire; the object of this being to definitely locate the chief mass of flame. This could have been done without great expense at Moor-lane.

(8.) That any openings between stores and workrooms should be closed by fire-resisting doors, automatically held shut when not in actual use, so as not to be blown open by the expanding air on the occurrence of fire.

(9.) That ample gangways should be arranged in workshops, and that waste and cuttings of celluloid should be frequently cleared away from the floor.

(10.) That means of escape be provided as now, but that regard be had in planning them to (a) reasonable possibilities of outbursts of flame from adjacent windows of the factory; (b) the probable paths to be taken by escaping workers over adjoining roofs and the guarding of critical points by handrails; and further, that employers in this trade especially be required to have their employees definitely and periodically instructed (preferably in presence of the Factory Inspector) as to what is to be done in case of fire and what are the means of escape other than the staircase, etc., in daily use.

(11.) That the practicability of providing simple movable plank bridges of light construction across light courts and areas in the City should be considered. The objection to these as burglar helps could be largely met by a very heavy increase of punishment for any burglar who operated in a building where such a bridge existed. This would add a desirably unpleasant element to burgling enterprise in London, as there would always be the chance of a hidden fire-escape to be reckoned with. We do not think it reasonable to consider the burglar's feelings in such a matter.

Finally, we would deprecate any panic legislation or enactment of hard-and-fast rules, and we would like to see the duty

of examining and pronouncing upon plans of such factories in London placed in the hands of men possessing wide general experience of building and surveying matters as well as having knowledge of fire and its behaviour under varying conditions.

NOTES.

The Summer School of Town Planning.

ON Saturday evening last, the inaugural meeting was held in the Institute of the Hampstead Garden Suburb. In well-chosen words the Earl of Crewe, K.G., spoke of the great national importance to the English people of the town planning movement which for many years has been before the public in all the principal countries of Europe. Approaching the subject from its widest, historical, aesthetic, and practical points of view, he dwelt incidentally upon the success which has crowned the efforts of the founders of the Hampstead Garden Suburb to create and develop in the short space of a few years a beautiful estate on the very fringe of London. England had been years behind continental countries in making a move. He briefly reviewed the re-modelling of Paris by Baron Haussmann, and the developments which have made Vienna one of the most beautiful cities of Europe, while he instanced Germany as having pointed the way towards sensible town planning and construction years before England had wakened up to the possibility and desirability of such organised enterprise. Owing to our climatic conditions and the home life of the people, England is proving her capabilities of surpassing the best achievements of her neighbours, now that the movement is beginning to be understood and fostered by the people. If in Wren's time town planning in practice could not prosper because it was dependent upon the genius of a master mind to conceive a scheme, the people clinging to their vested interests too tightly to allow it to be carried out, change of thought, broadening interests, and wider culture were to-day bringing to the minds of the British public those benefits which were allowing them on all hands to combine with architects of lesser calibre, but equal foresight, to put into execution schemes which sooner or later are bound to bring inestimable benefits to themselves and their descendants. In such a school as this he pointed out that it was possible to study by comparative methods the town-planning projects of the world while they were assembled in the midst of an actual example which had many object lessons to teach.

The London University and Town Planning.

IN explaining how it was that the University of London gave its ægis to such a "Summer School" as this, the Principal, Sir Henry Miers, explained that, as was by no means unusual, the Course had been arranged by the "University of London: Board to Promote the Extension of University Teaching," in this way breaking the ground for a properly-established Chair, to be filled before long by a Professor of Town Planning in the University itself.

We look forward to the founding of a Chair in the new University of London School of Architecture which is building on the grounds of University College. By such a step we hope London will be relieved of the which so often, and in this case flagrantly, attacks her prestige, the only continental cities look to these subjects, but that even our own vinctial Universities establish Chairs in Town Planning, while she stands heedless of opportunity and regrettably of the march of progress. London will afford to be left behind, and the such a subject is recognised and on sound lines day by day, the better England, for her people and her

The Architect's Burden.

THE tale of the architect's necessary and lengthening burden of his responsibilities is heavier. A complex entanglement of rules, regulations, and by-laws of and central authorities harasses movements; legal responsibilities more exacting and threatening; tedious processes multiply; the rush pressure under which commissions once secured—have to be executed daily increases. All this and more one end of the tale. At the other those who, with an enthusiasm far equalling that of the valetudinarian Health, remind him that his business to "make art," that he is not an artist, but something of the schoolmaster as well, with a dash of modern seer prophet. And now comes another without some reference to which form of architectural criticism seem to be complete, and which, by repetition and misuse, bids fair to become the hackneyed way of many another word before it. The architect's must be "scholarly," and himself inference, in addition to all the scholar. We feel it is indeed time for the profession, following, where it should the example of other workers, to organise itself as Guild or Union, and see to somewhat comprehensive demands upon it, of which we here name but at the extremes. Certain other urgent and complementary considerations would also claim their attention, if they do not exhibit the same cumulative tendency. Of these, however, we rather say no more in the presence of such august company.

Scholarly Architecture.

It may be worth to consider for a moment the significance of the word "scholarly" as applied to architecture. If it be meant to express degree and refinement of design, and beauty of conception as well as execution, what need to depart from words more proper to executive art in the ordinary sense it applies to distinguished learning, especially in the kinds, such as literature, history, archaeology. Without doubt the architect's work is the better for a real grasp of the humanities, and the last-named, of course, an essential preparation for the practice of his art, far, the term has a very sound application indeed. But this is not the of architecture; nor is the most scholastic

arily the best architecture, as well-instances attest. It is difficult to, however, what other application it, ve, or to take it otherwise than at value as an academic term savouring the studio or the workshop than of hools, with their tendency to seek inspiration too exclusively in the art st ages. Scholarship is excellent, more than the learning of the s, architecture needs the skill of eative designer and the cunning r, the architectonic powers of sation and arrangement, direction control, and that practical and te knowledge of men and affairs ary to the artist who has to give and beautiful outward shape remembrance to modern needs and ements. However gifted by nature killed by training in these powers, architect cannot ignore the past, but im to bring it into right relation the present. Doing this he will o keep alive and foster that social ite interest and appreciation ut which a true architecture is sible. As artist, taking up the burden of his Art, he is making it truly educational than by attempts, ver "scholarly," to reproduce the y peculiar to past phases.

Cottages Guildford Safe.

THE storm of protest which was raised a few months ago in consequence of the threatened demolition of a group of XVth-century cottages at Guildford, to which issue was made more than once in *Builder*, has had a satisfactory result. The cottages occupy a commanding position on the Farnham-road, were included in a scheme for road-widening, the local authority having asked the Surrey County Council, who are to contribute towards the cost, an undertaking to carry out the work in a number of years. When it became known that the cottages were in imminent peril of being swept away, leading antiquarians and archaeologists familiar with the old-world charm of the buildings expressed their opinion in strongly-worded protest, and appealed to the authorities to adopt an alternative scheme for preserving the "neck of the bottle" at the junction. The immediate upshot of this protest was a conference between the county and local authorities, and in the result the County Council have decided to relieve the council of their obligation to proceed with the scheme, provided they undertake the widening of a dangerous corner leading on to High-street, the need of which has been accentuated by the enormous increase in through traffic. The scheme will involve an expenditure of over 10,000l., towards which the Road Board and County Council have each agreed to contribute 3,000l. The Guildford Town Council the same day accepted the offer, with the result that the cottages destruction scheme has been abandoned. It should, however, be borne in mind that the cottages are private property, and that there is nothing to prevent their owners from doing what they like with them. At the time of the agitation it was suggested that the societies interested should take

steps to secure the permanent preservation of the cottages to the nation—in the event of the scheme being abandoned—and it remains to be seen what their action will be. The Town Council do not intend to purchase the cottages, having already been mulcted in 450l. costs as a result of the preliminary negotiations necessitated by the original scheme.

The New Post Office Buildings and St. Paul's Bridge.

We publish this week a letter from Mr. Arthur Crow on the subject of the new Post Office buildings and St. Paul's Bridge. We feel that the subject is a most important one, affecting as it does the approaches to the new St. Paul's Bridge and the success or failure of a new street from a point of view of town planning. To secure this Mr. Crow contends that it is necessary to remove the whole of the narrow block of buildings between St. Paul's churchyard and Old Change and the small block of shops bounded by Cheap-side, Foster-lane, and the old loading-yard of the General Post Office. With regard to the first of these works, it is not proposed by the authorities to remove the whole of the narrow block of buildings, but to leave a tapering wedge-shaped block facing the bridge. This will carry the eye round to the left of the axial line, and the new road will terminate in a view of the shops at Sweeting's Corner. The Postmaster-General has intimated that he will be prepared to consider any scheme of improvements which the City authorities wish to submit, and Mr. Crow's suggestion is that the authorities should be asked to delay the commencement of the new Post Office for a few weeks so that the subject may be considered. We feel that this contention is reasonable and well justified by the important bearing of this improvement on the architecture of London, but, Mr. Crow's letter having reached us as we are going to press, we have no opportunity of criticising the proposals in detail. Next week, however, we intend to refer to them at length, illustrating the points raised by plans.

THE ROYAL ARCHÆOLOGICAL INSTITUTE AT NORTHAMPTON.

(Continued from page 136.)

The proceedings on Friday, July 26, began with a visit to Canons Ashby, where the charming house of the Drydens was inspected, under the guidance of Mr. Gotch. The various rooms are disposed about a small quadrangular court, with the hall on the north, the kitchen and offices on the east, the brewhouse, etc., on the south, and the dining-room and library, with staircase tower between, on the west. Over the library is the drawing-room with a fine coffered plaster ceiling. The house was begun in the middle of the XVth century and brought to its present form about a century later, but was somewhat modernised by Edward Dryden in 1708-10, when the garden walls, gate-piers, and other features of the delightful lay-out were added.

The church, which was next visited, was described by Mr. Hamilton Thompson as a fragment of a priory church of Austin canons, in which there were parochial rights. When all else was destroyed at the Suppression it thus happened that the three western bays of the nave, with two bays of the north aisle and a tower to the north, were preserved for the

parish. The two remaining arches of the XIIIth-century arcade are of so dignified a character that one regrets the disappearance of the rest, and the west front is enriched with some excellent wall arcading of the same date, which is copied on the base of the XIVth-century tower. The west window dates from about 1470, the east end from about 1540, while the south wall, against which the canons' cloister abutted, was rebuilt on the old lines in 1710.

Byfield Church, which was next visited, is remarkable for the fine and tall two-light, segmental-headed windows of its XIVth-century chancel, and for the pretty arrangement of the west front of the steeple, with its ball-flower enrichment. In the south-west corner of the chancel is a large two-light "low-side" window of late XVth-century date, which seems always to have been glazed.

The afternoon was given up to a visit to Fawsley. The ruined dower-house in the park was first inspected. It consists of a small, oblong, two-storied building, with a large octagonal vice on one side to the upper floor, all of good brickwork, *temp.* Henry VII., with enriched chimney stacks of East Anglian character. To this has been added, not long after its completion, a large T-shaped block, consisting of a second oblong, two-storied building, with a small intermediate hall (?), with chamber above, entered apparently from a porch. This addition is of stone, but owing to the disappearance of its internal divisions, and the rebuilding of several of its walls, its arrangements are somewhat uncertain.

Fawsley Church, which was described by Mr. Thompson, is of little interest architecturally. It contains, however, some good paving, *temp.* Henry VIII., with curiously-carved panels, and a number of fine monuments, including an alabaster tomb with effigies of Richard Knightley in collar of SS. (d. 1533), and his wife Joan, with male and female weepers along the sides, retaining much of the old colouring.

Fawsley House was lucidly described by its present owner, Lady Knightley of Fawsley. It consisted originally of ranges of early XVth-century buildings, disposed about a quadrangular court, of which the hall formed one side, but the former picturesque aspect of the house has been sorely obscured by the addition (by Salvin) of two dull and dreary modern wings one either side of the hall, and the obliteration of many of the internal arrangements. The hall has lost its porch, but retains a beautiful lofty bay window. Some interesting portions of the old buildings form the back of the house.

At the evening meeting Mr. J. A. Gotch read a paper with lantern illustrations on some of the great houses of Northamptonshire, a subject upon which no one has a better claim to speak with authority.

On Saturday, 27th, an excursion was first made to the picturesque church of Stanwick, with its unusual western steeple. This is five-sided at the ground level, but when clear of the roofs is carried up as an octagon, and surmounted by a spire, both being of XIIIth-century date. The chancel contains a richly-moulded recess behind the north jamb of the arch to the nave, and in the south (and only) aisle is a fine lavatory with two drains. The font is a rich one of the XIVth century, but has, unhappily, lost its shaft, and the bowl now rests upon the base.

Raunds Church, the next objective, was described (as was Stanwick Church) by Mr. Thompson. It is a very fine building presenting several curious problems, and seems to have been begun as an aisleless cruciform XIIIth-century structure, with a tower over the crossing. The tower was apparently superseded early in the XIIIth century by the present beautiful western steeple with its spire, and a south aisle added which absorbed the former transept. Late in the same century the chancel was lengthened, with a large south chapel in continuation of the south aisle. In the XIVth century a north aisle was added to the nave, but without reference to the spacing of the south arcade, and a new chancel arch built which abuts on the latter in an awkward fashion. During the XVth century the nave clearstory was built, sundry large windows inserted, and the lower story of the tower vaulted in stone. This last work involved the obscuring of the beautiful inner arch of the west window, which can now be seen only from above the vault. There is a good south porch with chamber over, but the old two-storied vestry north of the presbytery has been destroyed.

The church contains some interesting and well-preserved remains of distemper paintings, especially on the north wall of the nave, where figures of Pride and the Seven Deadly Sins, St. Christopher, and *les trois morts et les trois vifs* can still be made out. In the north aisle is another series of wall paintings of the story of St. Katherine. Within the tower arch is a XVth-century clock dial with paintings of supporting angels, and of the donor and his wife. There is a good screen across the south aisle, and the front, with its projecting ram's head, also deserves notice. Within the tower are preserved two of the old fire-hooks for pulling the thatch off burning buildings.

The journey was next continued to Higham Ferrers, where after luncheon the fine church and its surrounding buildings were inspected, and described by Mr. Thompson.

Higham Ferrers Church is remarkable for its unusual plan, which consists of two parallel chancels and naves separated by arcades, between a north and a south aisle. The latter has a south porch, and at the west end of the southern nave is a lofty tower and spire. This and the nave, with its aisle and chancel to which it is attached, are mainly of the XIIIth century, but the northern half of the building is chiefly of the XIVth century, when the present windows of the south chancel were inserted. The beautiful steeple was taken down and carefully rebuilt with much of the old material in 1631-2, and is remarkable for its rich recessed doorway. This is double, with the Tree of Jesse carved on the jambs and across the segmental heads, and has a pointed tympanum above, filled with sculptured medallions on either side of an ornamental bracket, and housing for a lost image of Our Lady and Child. The sculptures represent, on the north, the Salutation, the Annunciation, the Adoration of the Three Kings, Christ disputing with the Doctors, and His Baptism; and on the south, the Adoration of the Shepherds, the Crucifixion, the Vision of Zacharias, the Three Maries at the Sepulchre, and the harrowing of Hell. The XIVth-century additions to the church were apparently due to an unknown benefactor whose canopied tomb is placed in the wall between the two chancels. It now contains the marble slab and fine brass of Lawrence Seymour, rector, who died in 1337, but the rough edges of the slab show that it has been moved here from its original place in the floor. The south choir has its altar platform paved with old figured tiles, and has also a good rood screen, and a fine series of stalls with carved misericords, inserted when the church was made collegiate by Archbishop Chichele in 1425. Behind the north stalls is an original parclose. The north choir has also a good rood screen, and in the floor a considerable number of monumental brasses, chiefly of the Chichele family. Its east end is cut off by a wall, against which stood the altar, to form a vestry, entered from the south choir. The east ends of the aisles have the altar platforms partitioned off by wooden enterclosets of different dates, that to the south being *temp. Henry VIII.* The various wooden roofs are worthy of note, but the rood beam, which was in place half a century ago, has disappeared. The font is a good plain example of the XIIIth century.

The very interesting bede-house, which stands parallel with the church on the south, consists of a lofty hall with good west window, etc., with a square chapel opening out of it to the east and formerly divided from the hall by a screen. The bede-house dates from 1423, and was formerly the abode of twelve poor men, one of whom acted as Prior, but is now an empty shell with no remains of its ancient arrangements save the large chimney in the south wall. The chapel stands above a sub-vault, which was probably a bone-hole.

Just to the north-west of this church stands another building of Chichele's foundations, the so-called schoolhouse. This is three bays long, and is built as a chapel, with a drain for its altar in the south-east corner and a vice in the south wall to the rood loft, which subdivided the building. The west end seems to have contained a low ante-chapel lighted by a row of four small lights under the large window above. To the south of the school-house are the steps and part of the shaft of a rich XIVth-century cross.

Of the college buildings little remains beyond the front of the gatehouse, in the main street, somewhat north-west of the church.

Rushden Church, which was the last item in the day's programme, was described by Mr.

Thompson as being almost entirely of the XIIIth century. It consists of a chancel and nave, both with aisles, north and south transept chapels and porches, and an exceptionally beautiful western tower with crocketed spire of the XIVth century. The nave clearstory and the curious transverse tracered arch belong to the XVth century, when the chancel aisles were rebuilt. The church contains much excellent old scrollwork and richly carved roofs, as well as a mediæval wooden pulpit and some remains of old glass. The east end of the chancel north aisle is cut off by a wall, like Higham Ferrers, to form a vestry entered from the chancel.

At the evening meeting Sir W. Ryland Adkins, K.C., M.P., read a paper on the "Story of Northamptonshire."

Monday (29th) began with a visit to Lowick Church, with its striking west tower and octagonal lantern. Mr. Thompson showed that with the exception of some earlier work in the chancel the whole church had been rebuilt between 1369 and 1415. The nave and aisles were probably due to Sir Henry Greene (ob. 1399); the north chapel was perhaps completed by Ralph Greene (ob. 1418); and the chancel by Ralph Greene (ob. 1418), rector, 1406-15. The steeple belongs apparently to the earlier rebuilding, but the lantern is later. A south chapel was added, probably, by Henry Greene (ob. 1467-8), and contains his tomb and brass. The chancel and north chapel windows contain a lot of heraldic glass, while the curious transomed windows of the north aisle, infilled as to their upper lights with pieces of a splendid early XIVth-century Jesse Tree, with ruby background, removed hither from some large window of that date, now destroyed—perhaps one formerly in the east front. Mr. Hope pointed out that the figures in the Jesse Tree were the work of three distinct though probably contemporary glaziers, who each used a different class of lettering for his inscriptions—lettering that suggested a date c. 1345. Mr. Hope also spoke about the two fine alabaster tombs in the church. That of Ralph Greene (ob. 1418) and Katherine his wife between the chancel and north chapel was especially noteworthy, because the contract for its making was known. By this, which was dated February 14, 1418-19, Thomas Prentys and Robert Sutton, of Chellaston, in the county of Derby, "kervens," undertook to make a tomb of the stone called alabaster, upon which shall be made two images of alabaster, the one of an esquire armed at all points, with his helm under his head and a bear at his feet; the other of his lady, holding one another by the hand, with two tabernacles, called "gables," at their heads, and on the sides of the tomb angels holding shields. The whole was to be set under and within an arch of alabaster with pendants and knots and an ornamented cresting. Images, tomb, and arch were all to be gilded, painted, and arranged with colours well and sufficiently, and for the whole work the aforesaid "kervens" were to receive 40l. and undertake to finish it within little more than a year. The monument has lost the alabaster arch and almost every trace of its colour and gilding, but is otherwise in beautiful order, and Mr. Hope indicated the special features by which other tombs, of which there are a great many in England that emanated from the Chellaston works, might be recognised. He also claimed a Derbyshire origin for the other monument, that of Henry Stafford, Earl of Wiltshire (ob. 1499), in the south chapel, on account of the little bedesmen crouched under the feet, and pointed out the cordon of Stafford knots and wheel-naves that encircled the shields about the tomb, and the collar of the muzzled bear at the feet of the effigy. He also referred to the delicately wrought collar of linked SS. shown about the Earl's neck, and cited the cumulative evidence that the SS. collar signified the favourite "word," sovereignty, of Henry IV., which he adopted while still only Earl of Derby in 1385, and was painted on the tester of his tomb at Canterbury. From Lowick the journey was continued to Drayton House, when the members of the Institute were hospitably received by the President. of the meeting, Mr. S. G. Stopford Sackville, who himself acted as guide over his beautiful and famous home.

Though outwardly largely a work of the XVth and XVIth centuries, the main block still incorporates the great hall and the fine sub-vault of the great chamber of the manor house of Simon of Drayton, who had licence to crenellate it in 1328; the outer wall of the court

before the hall is also his work. The hall (to the north) was rebuilt in the XVth century, and in 1584 the third Lord Mordaunt added north-east wing, with the long gallery on third floor and a vaulted ceiling in the bay together with the towers flanking the front and the intermediate blocks. In the XVIIth century the second Earl of Mordaunt laid out the gardens, built the bathing-house in the east garden, and moved the main entrance to the south front of the house. After the marriage of the Earl's daughter, the Duchess of Norfolk, to Sir John Gernon, 1701, the stately entrance façade was added, a number of other changes made in the house, including the ample spiral stair to the gallery and the grand staircase behind it. Sir John's second wife, Lady Elizabeth, after her death in 1769, added the chapel and buildings along the south side of the house, and the colonnades at its ends. The ordinarily picturesque appearance of the house, its beautiful surroundings, and its wood furniture, china, pictures, and other objects all tend to make Drayton House one of the monuments of its kind in this country.

After luncheon at Thrapstone a visit was made to the interesting church of Woodliff, which consisted at first of an aisleless chancel and nave with western tower, all of XIIIth century, but towards 1200 a north aisle was added, both nave and chancel. Somewhat later the tower was raised and a spire set upon it, a new chancel of at least equal length, and east of the older one, the north aisle was added, and a south aisle built to correspond. The tower was also added on the south side, having the east of it a vaulted undercroft of three bays for a dwelling-house above, which occupied also over the porch, and was reached by a stair west of it from within the church. In a late XVth century reconstruction the north aisle only the westernmost bay of the middle now remains, as a dark recess opening into the aisle, and all the upper works have been removed. Among other features of interest the wooden effigies of a knight and his lady, and the six-sided font; the XIIIth-century south door is also noteworthy for its excellent beauty.

The Church of St. Peter, at Irthlingborough, which was also visited, resembles Woodliff in the similar unusual provision of a dwelling-house in immediate connexion with it. In this case it was built west of the church, incorporating the tower with its singular octagonal plan, and, as explained by Mr. Thompson, for the accommodation of the members of a priory of priests founded here in 1375 by John de Walsingham, and completed by his widow in 1388. The sub-vaults of the building remain, to the east of the steeple, and owing to a recent rebuilding of the latter other traces have been obliterated. The hall seems to have stood on the south side of the church, but not unlike that of Rushden, and contains several charming windows and other features of interest, including the effigies of a lady and of Master John Pryn, his wife. Under the south transept is a bone-hole.

At the evening meeting a paper was read by Mr. T. J. George on the "Earthwork Northamptonshire."

(Our report will be continued next week.)

GENERAL NEWS.

St. Paul's Cathedral.

Under the directions and superintendence of Mr. Mervyn Macartney, Architect to the Dean and Chapter, a new installation for protecting the fabric from fire is being carried out by Messrs. Merryweather & Sons.

Science Museum.

Captain H. G. Lyons, F.R.S., has been appointed Assistant Director of the Science Museum by the Board of Education.

Sub-Inspectorships of Mines and Quarries.

Appointments of fifteen sub-inspectors of Mines and Quarries are about to be made by the Home Office. They will be awarded after limited competition, and applications for nomination should be made, before August 10, on printed forms supplied by the Secretary, Home Office, London. The salary is 150l., rising by 5l. to 200l. per annum.

Mr. W. K. Shirley and the Earldom of Derby. Consequently upon the death, on July 20, of Sir Sewallis E. Shirley, tenth Earl of Derby, the earldom devolved upon his son, the present Marquis of Salisbury.

(Continued from page 139.)

The improvement of the housing conditions of the working classes, the abolition of slums, and precautionary measures, by means of town-planning schemes, which would preclude the possibility of their recurrence, were objects that might well be common ground for all students of sociology, and for all who had at heart the uplifting of the race. Having touched on the question of labour unrest and the Insurance Act, Mr. Smith said that he did not doubt that the problem of rural housing was becoming particularly acute, and that all unnecessary restrictions must be removed, and all possible facilities rendered to enable efficient and sanitary housing conditions to

At a sitting of the Court on August 1, Sir P. Kempe, D.C.L., the newly-appointed Chancellor of the Diocese of London, agreed to the faculties in respect of two petitions concerning the churches of St. Michael, Cornhill, and St. James's, Ratcliffe. In the former certain alterations will be made in St. Michael's-alley—formerly included in the

be provided in the rural districts. New legislation was also thought to be called for by the importance of housing conditions upon the industrial unrest. It was urged, as he understood it, that by-laws operating in England, framed under sect. 157, Public Health Act, 1875, were too stringent and too rigid. It was quite probable that this might be the case, for, whilst too easy departure from carefully-conceived by-laws was to be deprecated, it was obvious that by-laws which might be quite justifiable and desirable in a manufacturing burgh, where there was a great intensity of building of the tenement type, might be unreasonable and unnecessary in a residential or agricultural village, sparsely populated with cottages detached or arranged in short blocks. There was already power given under sect. 44 of the Housing and Town Planning Act of 1909 to revoke unreasonable by-laws in connexion with the erection of dwellings for the working classes. There was also given to local authorities, under sect. 55 (2) of the same Act, somewhat drastic suspensory powers in connexion with by-laws where the local authority prepared or adopted a town-planning scheme. This power might be of very great use, but, in order that it might be made available, it was necessary that a town-planning scheme be prepared and approved, whereof suspension of by-laws would form part, and would be shown to be in the circumstances, and having regard to the general scheme, reasonable and desirable. In circumstances such as these there is permitted the full consideration of special conditions and local circumstances which would be denied with by-laws of rigid application. Some might think that suspensory powers might be granted without the necessity of preparing a town-planning scheme, whilst others would apprehend thereby confusion and resulting detriment to the public health and safety.

Modification of the Model Building By-laws.

Mr. Halsey Ricardo, F.R.I.B.A., in a paper on the above subject, confined himself generally to rural by-laws. He said that by-laws were not enacted to check building, but to secure good building. It was a matter of common knowledge that they had failed to secure the latter. In the country, except for the matter of sewage disposal and the protection of the water supply, one might argue that no building by-laws were requisite. Each cottage, or group of cottages, should stand on an adequate area of land, and the owner should be responsible for their proper construction, and for any strictures that the Medical Officer of Health might have to pass on them. The danger from fire was not a great one; the precautions under the by-laws were not really adequate, or easy to enforce, for the occupant could, and did, stultify some of them habitually when furnishing his rooms. The Public Health Act was to see that he was neither a danger nor a nuisance to his neighbours, and as long as this could be secured efficiently, the rest might be said to be the owner's business. However, the Local Government Board did not take this view; and had promulgated a series of model by-laws for rural districts, which were in force throughout nearly half the country—laws which, when once adopted, the district councils were powerless to abrogate, and which the Local Government Board declined to modify to suit individual requirements. Moreover, the Board enjoined on such local councils as might be desirous of having building by-laws, a further embroidery of restrictions, specifications, and demands, till the original purpose of the model by-laws was quite overlaid by the numberless provisions and safeguards, appropriate for the most part to urban requirements, or to districts that were in the process of becoming urban. And the local councils were eager to meet this demand from the Local Government Board, on the ground that it relieved them and their district surveyor from a great deal of responsibility; they had the comfort of knowing that these laws were in pretty general use, and that seemed an evidence of their suitability; they adopted a plausible theory that a network of cast-iron regulations protected the individual from many petty injustices, and put the community on an equal plane of health protection. This anodyne to the conscience was illusive; the enforcing of regulations to their logical extremities,

regardless of the local conditions and requirements, resulted in harshness and absurdities. There could never be an equal plane of health protection realised. Human nature was as various as the soil it lived upon; the more precise and detailed they made the restrictions, the more they discovered the essential differences that there were both in persons and in things. Of course, it might be urged, if each case was to be treated upon its merits, under a set of general regulations, it would throw a great deal of responsibility on the district surveyor, and on the council itself, and no one proposing to build would know beforehand exactly where he stood, and what the decision he was awaiting might be. But they could safely assume that common sense would guide these decisions, and that the worst such uncertainty entailed was delay. Meanwhile, under the present arrangement of local by-laws enforced by the county councils, a system had grown up of unnecessarily costly building; this was a vested interest the councils were naturally anxious to preserve. Under their own by-laws they had been penalised in their own efforts; they had been made to conform, regardless of suitability, to their own regulations; they had subscribed painfully to a costly ideal of building, and they did not want the competition of a cheaper form of house. That anybody should be enabled to build, subject to sanitary safeguards, but without restriction as regards construction, would appear to them as an intolerable surrender of the restrictions under which they had worked, and to which they had submitted.

There was practically no appeal from the decisions of the county councils. Literally it might appear to be possible, but no individual, at any rate, would be prepared to devote the time and the money to carry up the appeal to the Local Government Board. Their decisions, then, were virtually final, and confined within the four corners of their by-laws. But these councils were not agreed as to what they considered to be the principles of health and construction. They were required to define, for example, the minimum height of rooms; and for rooms on the ground floor there was a consensus of opinion that they should be at least 8 ft. high. But when they came to rooms in the roof, or partially in the roof, some councils required that the room should nowhere be less than 5 ft. in height, and 8 ft. to the extent of half the superficial area of the floor; whilst others (such as Godalming) were content with 7 ft. in height from floor to ceiling, to the extent of two-thirds the area of the floor, with a minimum of 4 ft. at the sides. On the other hand, Midhurst, for example (in the by-laws dated 1895), required the ground-floor rooms to be 8 ft. 6 in. high, the bedrooms 8 ft. 6 in., and the rooms partially or wholly in the roof to be 9 ft. for two-thirds the superficial area of the floor. Some councils seemed to insist on the ground floors having boarded floors on joists; others permitted what was generally the more satisfactory method of having a concrete floor, to which the boards were nailed direct, although this was not contemplated by the model by-laws. The provision for space around cottages was shockingly inadequate; it was not nearly sufficient for the disposal of the refuse of the house. It was a minimum that possibly had to be accepted in a congested town, but could never be excusable in a rural district. The model by-laws required that "every person who shall erect a new domestic building shall construct in every habitable room" one or more windows, the sum of which should be equal to one-tenth of the floor area, and that one half at least "of such window" made to open. This regulation appeared to be accepted by all the various local councils who had adopted by-laws without question, and also, he thought, was, of course, essential to every habitable room, but regard must be given to the source of light available for such purpose. The quality of light depended on the aspect of the window, its position in the house, and its position in the room. It was obvious that the quantity of light given by an attic window that had an unobstructed view commanding the south differs materially from that given by a window on the ground floor looking into a backyard to the north. Also the position of the window in the room

mattered greatly. A window that opened immediately under the eaves of the roof, low down near the floor could not give room as efficiently its quantum of light window whose head was a few inches from the ceiling. No general statement of position could meet the case, and to fix a minimum of one-tenth the floor area was at most they could only say in general that ground-floor rooms required window area than first-floor rooms, since outlook was generally more obstructed on the ground floor; and that not only the window area should be provided, but the requisite, since windows make the room in summer and cold in winter, any excess which was prejudicial to their effect. The model by-laws declined to differ between an earth-closet and a privy, local councils, as a rule, made the distinction. Some allowed an earth-closet with house; some forbade, and stipulated should be at least 10 ft. away. Now, this might in some cases be a valuable caution to take in poor cottages, but it was an extremely arbitrary interference in the case of superior buildings, for the no question that a properly-managed system was more sanitary than a water-closet. Again, wastes from baths and were far better dealt with above ground being made to travel through pipes, cesspool, which was to be constructed in accordance with the model by-laws to be "impervious to liquid." In other words, they required a costly system of traps, pipes, and recirculation to enable them to keep their sewage in the house, and then in that state to bale it out on the ground; whereas if to go there, it was better to put it before it went bad. About the provision of a pure-water supply the model by-laws were silent, except for ensuring that the water when on the site, shall be guarded against contamination from the house drainage; it ought to be made compulsory that the water supply should be permitted to be without proper provision for this end. The model by-laws were wise in insisting on dry walls, and leaving the builder to provide in respects unfettered as to size, material, strength, etc. But the county councils in their local by-laws, had refined and had gone into great particularity in requirements and specifications on all heads. Their regulations ignored the cottaged local methods and tradition; they refused to permit timber construction, apparently, the erection of mud or brick walls, and they ruled thatch out of doors as a roof covering. Now, timber construction, in some districts, was a very convenient method of building a house; it could be made perfectly snug and airtight; it was sufficiently durable; the danger to life from fire was not a serious one, or really greater than the danger from the erections, permissible under the model by-laws, of so-called "incombustible materials." The same could be said of thatch. As for covering it was far superior to slates in respect of comfort, since it kept the house warm in winter and cool in summer. One's own experience was that it was better for a thatched roof to be set on fire than to suppose it was a vain thing to the county councils to discourage the use of hollow walls above ground. He considered them a faulty construction, leading to all sorts of subsequent disaster. It was better, and not much more expensive, to have the walls solid, and jacket them with a waterproof outer coat of cement, or a rough-cast. If the councils were given the opportunity, they would insist on minute details of construction, and when they specified the scantling of timbers and floor joists, and they took away from smoke flues, they should require their insistence still farther. They required that the walls over the mantelpiece and at the sides of the chimney breasts should be 9 in. thick where the flues occur; that the external faces of the chimney-stacks should emerge from the roof, should be 9 in. thick; that all skirtings should be made of cement, and where the plaster of cost may render this impracticable, plaster must be carried down behind the wooden skirtings flush with their base, in the usual building methods, the specification afforded a run for vermin, and in the fire added materially to its peril.

ing, where plastered wood partitions and the scantlings of the roof rafters and joists, in several cases regardless of the nature of the wood to be used. It would be better, if they must be particular, to content themselves with the sectional area; but why do so at all, it was, by prescribing the minimum, was really too little for inferior materials. The by-laws set a kind of standard, in masonry and carpentry, so that any work which exceeded the minimum was to his client to have committed an offence. On the other hand, by insisting on footings to every wall, where concrete was supplied, they created in cases an expensive obstruction of no sectional value. If the concrete was enough, the walls might just as well be of their natural thickness, and it was cheaper to build the walls in concrete below the ground level than in masonry above. The footings took up a lot of valuable floor space, and were a permanent feature. His conclusion, then, was that, in the model by-laws issued by the Government Board for rural districts, required amending in the article on window area, and bringing up to the matter of its provisions for drainage and sanitation of buildings, were in the main sufficient; and if they were accepted by the county councils, any glossary there would not have its dissatisfaction and outcry. It was to have made the position of the surveyor more responsible, but this from responsibility was not a whole element, and it led in many cases to slip and absurdities. And with all these unfair prescriptions and restrictions, buildings were being erected all over the country, which, he believed, would be impossible if the surveyors had a freer hand in their examination of the plans submitted for proposed buildings. The question of providing housing for transitory labour seems an important one, and the provision of erecting cheap temporary buildings, dry and sanitary, had an especial interest.

H. D. Searles-Wood, F.R.I.B.A., who was unable to remain at the Congress, commended the following notes on the paper: "The model by-laws issued by the Local Government Board for use in rural districts deal with (a) structure of walls and foundations for purposes of health, and not with (b) sanitary matters. Even if surveyors have not secured good building they have checked bad building, and this is their main object. There are no fire clauses in the rural model by-laws. The Public Health Act has a far wider scope than the author indicates. In the matter of houses and buildings the principal object is to protect the public. District councils are powerless to abrogate their by-laws. The Government Board does not decline to issue by-laws to suit individual requirements, as is seen in the circular letter of 18, 1906. The Local Government Board can enforce unnecessary restrictions, specifications, and demands on local authorities. In regard to the statement that 'the councils are eager to meet this demand the Local Government Board,' there is no mandate from the Local Government Board. The councils have no powers to make laws. There are no restrictions as regards construction in rural model by-laws. There is no power of appeal to the Local Government Board, and the Local Government Board has no power to give a decision. A magistrate's decision is final unless carried to a higher court. The Local Government Board has, however, very frequently appealed to, and have secured modification in numerous cases. In consequence, Councils are not required to define minimum height of rooms; purely optional. The clauses relating to the number of rooms in the Midhurst by-laws were introduced in 1902, and another by-law substituted required 8 ft. and 7 ft. of superficial area of floor. Solid floors are provided for model by-laws. It would be inconsistent purposes of health" to require a larger of space round cottages in rural than in other districts. The fault, if any, is in the Act. With regard to the requirement of more windows, the sum of which shall

be equal to one-tenth of the floor area, that is not excessive under any circumstances. Too much is better than too little. The fashion for small windows is largely disappearing. The model by-laws (urban) allow an earth-closet within a building, and differentiate between the earth-closets and privies. There is no power to enforce the use of movable receptacles or of earth. A distance of 10 ft. for privies from a house is not a hardship. It would obviously be undesirable to allow open drains in small backyards or open cesspools. There is now power under the Act to make by-laws as to water supply, and hence their omission. The Public Health Act gives sufficient power to prevent the occupation of houses without a proper water supply. There is nothing in the rural model by-laws to prevent timber buildings being erected, or the use of thatch. It is impossible to prohibit the use of hollow walls. With regard to the suggestion that the councils should require walls where the flues occur, etc., to be 9 in. thick, this would rather add to the cost of cottage building. The by-laws always define the timber for which the scantlings are given. The sectional area is not a sufficient method. The strength varies according to depth and width. There are no clauses as to footings in rural model by-laws. Footings are not prescribed to be of brickwork, and might be of concrete. The by-laws require only 4 in. of concrete under buildings, which is hardly sufficient to carry a heavy wall. There are clauses specially prepared to deal with housing provided for transitory labour, and local authorities have power, under the Public Health Act, 1907, to license temporary buildings for this and other purposes.

Mr. Saxon Snell, F.R.I.B.A., remarked that they all knew the Local Government Board rules were minimum rules, and Mr. Searles-Wood's point was that there was no reason why in country districts there should not be a great deal more land than was laid down in the by-laws to the houses.

Mr. G. W. Lacey (Borough Engineer, Oswestry) said that Mr. Searles-Wood's criticism of the paper had practically cut the ground from the feet of other speakers. He agreed with the author that rural conditions should be taken more into account, and it was within his knowledge that the by-laws in some rural districts were more stringent than those of adjoining urban districts. Still, from an administrative point of view they must have by-laws, and if Mr. Ricardo's suggestion was adopted of leaving a good deal of detail to the architect and builder, he was afraid there would be considerable difficulties in administration. The question of cheaper construction was an important one in view of the enhanced price of materials. It might be advisable, perhaps, to try and cheapen construction in rural districts, but they must remember that cheap building meant heavy maintenance cost, and probably the old adage was true, and the best was the cheapest in the end. There must be a minimum fixed in the by-laws, and the danger was lest it should be fixed too low. He considered that the laws regarding air space about buildings needed to be remodelled. Houses ought not to be allowed to be built in long rows without breaks for the circulation of air.

Mr. W. B. Pindar (Rural District Councils Association) pointed out that the author had an extremely hazy idea of the administration of the building by-laws in rural districts. He understood that Mr. Ricardo did not complain so much about the model by-laws, but to the fact that, as adopted in the various rural districts, they were much more stringent than the model laws. It was a treat for him to attend a meeting where the rural councils were given credit for being somewhat in advance of the absolute statutory requirements, as the general complaint was that they were slack and behind the times. With regard to air space, the land to be attached to a house was not for the disposal of refuse, but to give free circulation of air. The water supply was dealt with in the Public Health Amendment Act of 1878, and it was illegal to occupy a house without a proper water supply. He thought the complaint of the by-laws restricting the building of houses had been grossly exaggerated, for there were at present about 200 rural districts in England and Wales where there were no building by-laws,

and he had heard there was a greater scarcity of houses in those districts than where there were by-laws. In such districts architects had an absolutely free hand, and a wide field for experiment both in design and in the use of material.

Dr. Temple Anderson (York) strongly supported the author's views as to the disposal of the sewage from houses on the land adjoining them in country districts, and held that the great waste of manure was one of the greatest national dangers. He agreed that in big cities the by-laws were necessary.

Mr. Munce (Belfast) asked why the Conference did not agree as to which were good by-laws, and then consider what could be done to amend the others. Some people seemed to think that no one had brains except architects. In Ireland they discussed these things quietly with the officers of the Local Government Board, and always found them most courteous.

Mr. Cresswell (Carshalton) considered there was nothing wrong with the model by-laws, and, as he understood it, Mr. Ricardo himself did not object to them. It was recognised that the by-laws were not suitable to every locality, and hence each authority had the right to make, as it were, its own by-laws, modelled on those issued by the Local Government Board, and approved by the Board. As an architect, he would be sorry to think his brother architects would at any time endeavour to go below the by-laws. If he was worth his salt at all he would endeavour to go above them, and, in fact, he had always found that architects did. He agreed that hollow walls were not nearly so good as solid ones, and he also supported what the author said about cesspools. A case came within his experience of two adjoining districts, in one of which a cesspool with open joints was allowed to be put, whilst in the other the procedure was that referred to by the author.

Mr. Halsey Ricardo, in reply, enlarged upon his contention with regard to the disposal of the drainage of houses in country districts.

South Yorkshire Coalfield and the Housing Problem.

Mr. Arthur Dunne (Medical Officer of Health for the Doncaster Rural and the Bentley Urban Districts) discussed the problem of housing the immigrant population on the South Yorkshire coalfield, which is developing so rapidly that it is estimated in ten years 45,000 additional men and boys will be required in the district. Having touched on the nature of temporary dwellings, he said the housing of the permanent colliery population had of recent years attracted considerable attention owing to the fact that Sir Arthur Markham, Bart., M.P., had built for the employees and their families at the Brodsworth Main Colliery, a model village called Woodlands. Though this model village had largely occupied the attention of those interested, there were several other model villages built or under construction at Edlington, Bentley, Askern, and Owston, which embraced most of the good features of Woodlands, and others which were even better. As, however, Woodlands was a happy example of the way in which the great colliery companies were providing villages for their employees in this area of the South Yorkshire coalfield, a description of it would give the chief points of all of them. The model village lay four miles north-west of Doncaster on the Great North Road; it is situated in the parish of Adwick-le-Street. It was built on a limestone plateau, 140 ft. above sea level. The present village comprised 650 houses, and the number of houses to the acre varied from five to eight in the two portions of the village. The first portion of the village was erected in June, 1907. Here the houses were built round a large village green. The Park, as it was called, with its fine old timber and 12 acres of grass, formed a very pleasing feature of the village. In the extension of the village to the north of the park, the streets were laid out in broad avenues and crescents, along which trees had been planted. Between the adjacent crescents there were large open greens. The only criticism one would offer was that, with so much space, it was a pity that no small garden spaces had been added to these houses at the back. The houses were built in the half-timbered style,

with pebble dash and red tiles to the roof. There were three types of houses with respect to accommodation:—(1) Three bedrooms, large living-room, scullery, and larder; rent 5s. 3d. per week. (2) Three bedrooms, living-room, parlour, larder, scullery, and bath; rent 6s. per week. (3) Three bedrooms, bathroom (with hot and cold water), living-room, parlour, and scullery. Rent 6s. 6d. per week. All the houses had water laid on to them, and were provided with water-closets and sanitary ashbins. The conformation of the site of the colliery village facilitated the disposal of the sewage, which was dealt with at the sewage outfall works at a spot remote from the village. The company undertook the scavenging of the village, and employed men solely for this purpose. At the census of 1911 Woodlands had a population of 3,181, giving a population of 49 per house. It was unfortunate that the deliberation and discussion which were essential before the local authority could obtain sanction for schemes for the purposes of providing sewage disposal works and works of public water supplies were outdistanced by the rapidity with which these large collieries were being developed, and the attendant districts around each of them. These districts presented unusual opportunities for putting into force the town-planning sections of the Housing, Town Planning, etc., Act, 1909. No scheme had, however, been yet submitted to the Local Government Board. The development was taking place at such an extraordinarily rapid rate that it could not be wondered that the administrative machinery, which, under ordinary circumstances, was quite fitted to cope with the demands on a local rural sanitary authority, had been left somewhat behind in the race. Mr. Dunne added that the district afforded a unique opportunity to architects. The Archbishop of York was already on the site, and had got sites for churches.

Mr. Brodie (Blackpool) said he felt rather envious at the splendid problem which had to be solved. They had a condition of things to which the only parallel was in the gold-mining districts in the colonies. It was a unique opportunity for putting into practice the theories of town planning which they had spent so many words upon. They had heard how the Archbishop of York had tackled his part of the problem, and they, as laymen, ought not to be behind the church. He hoped the local authorities would be equal to their responsibilities, and that some future Congress would be held on the site, so that they could see what had been achieved.

Mr. W. P. Costain (Great Crosby), having been over the district, endorsed the views of the author as to the necessity for something being done. In some of the villages they saw the midden privies in all their hideousness, but at the village of Woodlands everything seemed to be of the highest order.

Dr. T. E. Francis (Medical Officer of Health, Llanelly) said in South Wales colliery developments had also been very great. The South Wales coalfield had developed slowly, but they had failed to take full advantage of their opportunities, as was seen in the present condition of the colliery towns and villages. He suggested that progress would be easier in the future if there was a consolidation, with amendments of the Public Health Acts, and it would be helpful if the law was uniform in England, Wales, Scotland, and Ireland. Secondly, there should be a simplification and shortening of the procedure in regard to the Town Planning Act. There was also need of uniformity in the by-laws of the various authorities throughout the kingdom as far as was compatible with the local conditions, and he suggested that it might be possible to take some by-laws upon which there was general agreement,

and insert them in a Consolidated Health Act.

Dr. Dunne, in reply, said that at the meeting it was suggested that the author should draw up a town-planning scheme that was where they stood at the time. He thought that each surveyor, see to town planning in his own area, they tried to drive too many horses team they generally got into the ditch.

(Our Report will be concluded next week.)

PUBLIC LIBRARY, BROMLEY, KENT.

The extensions of this library have been completed and were opened to the public by the Mayor of Bromley on July 26.

The first portion of the present library, opened by Mr. Andrew Carnegie, who gave the funds in 1906, and consisted of the main room and home-reading department, entrance-hall and small lecture-hall or reading-room.

The work just completed consists of a zinc-room adjoining the reading-room, a juvenile library, with librarians' ante-rooms on the south side of the home-reading department, and a large reference library by 35 ft., with a storage basement of the same size below, on the north side of the central hall.

On the first floor a second lecture or reading hall is arranged in conjunction with the main hall, in such a way that they can be either as separate rooms or as a combined hall of nearly 500.

The library is fortunate in its situation, while it is in the centre of the town it has extensive public gardens in the rear, with an opening outlook across the Shortlands Valley.

The windows of the home-reading department and of the reference library are supplied by large lantern lights in the centre, the roofs of these departments are fireproof.

Public Library, Bromley, Kent.

is necessary in order to form a separate entity
for insurance purposes, it is hoped that
support may be relied upon in furthering
an effort which should prove of benefit to those
in the professions who come within the pro-
visions of the Act, by asking clerks and others
who are eligible to join. There is nothing
to prevent persons who may have already
enrolled themselves in a non-professional
society from transferring their membership,
and, for the reasons stated herein, there would
seem to be definite advantages to be gained
by their so doing. All persons engaged in
architects and surveyors' offices and earning
less than 160*l.* per annum are eligible for
membership.

It is of importance, owing to the shortness of

ARCHITECTS' AND SURVEYORS' APPROVED SOCIETY UNDER THE NATIONAL INSURANCE ACT, 1911.

Architectural Association, in conjunction
the Royal Institute of British Architects
the Surveyors' Institution, have had under
eration how best the interests of their
ers and those in their employ who come
in the category of insured persons under
national Insurance Act may be promoted.
consultation with insurance experts, they
come to the conclusion that the formation
special "Approved Society" for Architects
Surveyors' Assistants and Clerks would
advantageous to those concerned, for
principal reasons, viz. :—

That their average health, as a class, is
That the proportion of persons passing out
category of insured persons is higher than

been decided to found such an approved
y. As a membership of at least 5,000

time, that applications should be made not
later than September 16 next.

We may add that the following letter has
been sent to us, and we have much pleasure in
giving it publicity :—

DEAR SIR,—We enclose a circular with
reference to the formation of an "Architects
and Surveyors' Approved Society" under the
Insurance Act, 1911. The proposal is sup-
ported by the following members of the two
professions :—

Sir Aston Webb, C.V.O., C.B., R.A., Sir
Ernest George, A.R.A., Sir Alexander Stenning,
F.R.I.B.A., F.S.I., W. Edgar Horne, M.P.,
F.S.I., Leslie R. Vigers, F.S.I., G. Corderov,
F.S.I.; and Professor Reginald Blomfield,
A.R.A., F.S.A., President of the Royal Institute
of British Architects; A. W. S. Cross, M.A.,
F.R.I.B.A., George Hubbard, F.S.A., F.R.I.B.A.,
Ernest Newton, A.R.A., E. Guy Dawber,
F.R.I.B.A., Vice-Presidents of the Royal
Institute of British Architects; Hon. Edward
Gerald Strutt, F.S.I., President of the Sur-
veyors' Institution; John Farrer, F.S.I.,
W. Edward Woolley, F.S.I., H. Chatfield
Clarke, F.S.I., F.R.I.B.A., Vice-Presidents of
the Surveyors' Institution; Gerald C. Horsley,
F.R.I.B.A., President of the Architectural
Association; W. Curtis Green, F.R.I.B.A.,
Maurice E. Webb, M.A., Vice-Presidents of the
Architectural Association.

We hope that you will give us every assistance
in the matter.

Yours faithfully,

F. R. YERBURY,
Secretary Architectural
Association.

IAN MACALISTER,
Secretary Royal Institute
of British Architects.

A. GODDARD,
Secretary Surveyors'
Institution.

NOTE.—All communications for the present
to be addressed to the Hon. Secretary, 18,
Tufon-street, Westminster, S.W.

COMPETITION NEWS.

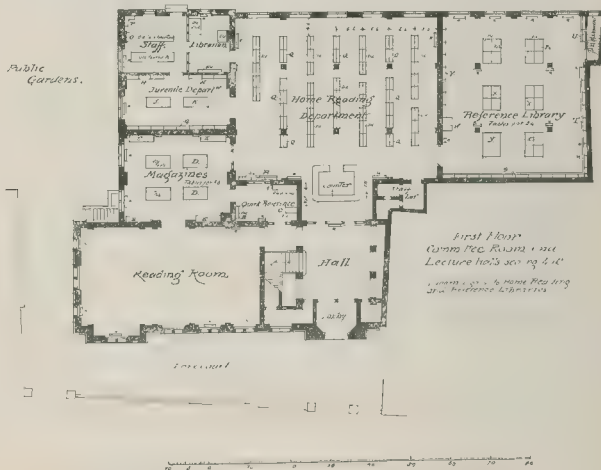

A list of current Competitions is printed on
page 189.

Prix de Rome d'Architecture.

The Grand Prix de Rome d'Architecture
has been awarded to M. Jacques, Edouard
Harold Debat-Ponsan, pupil of MM. Laloux et
Tronchet. Born in 1882, the son of the well-
known painter of "En Plein Air" and other
works. Monsieur Debat-Ponsan, entered the
Ecole des Beaux Arts in 1903. The premier
second Grand Prix has been won by M. Louis
Grégoire and the deuxième second Grand Prix
goes to M. Henri-Roger Expert.

Competitions for Designs for Royal Palace and Law Courts, Sofia, Bulgaria.

With reference to the notice on p. 12 of the
Board of Trade Journal of July 4 relative to a

Public Library, Bromley, Kent : Ground Floor Plan.

competition of designs for (1) a new Royal Palace and (2) new Law Courts at Sofia, his Majesty's Legation at that city have now forwarded a copy of a revised programme in connexion therewith, which takes the place of that originally issued. Architects wishing to compete must submit their designs, not later than December 1 next, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, etc., may be obtained on request. A copy of the revised programme (in French), together with drawings, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Farmhouse at Earlswood.

The first premiated design in this competition was by Mr. W. Newton Dunn, of Glenfeulin, Reigate, and 1 and 2, Bucklersbury, Cheapside, E.C. The competition was promoted by the Borough of Reigate.

Reigate Lodge Estate.

At the meeting of the Reigate Town Council on July 22, the Mayor (Councillor F. E. Lemon) presiding, the Town Planning Committee reported that Mr. Raymond Unwin, the assessor for the competitive designs for the laying out of a portion of the Reigate Lodge Estate, had awarded the first premium to Mr. Vincent Hooper, of Messrs. T. K. & V. Hooper, A.A.R.L.B.A., architects, Redhill; and a second to Mr. Reginald Dann, son of Mr. Arthur Dann, of "Kilronan," Furze-field-road, Reigate. Forty-five designs were sent in.

Competition for Designs for Monument, Ottawa.

With reference to the notice on p. 105 of the *Board of Trade Journal* of April 18 relative to a competition for designs for a monument to be erected at Ottawa to his late Majesty King Edward VII., at a cost not exceeding \$35,000 (about 7,200*l.*), his Majesty's Trade Commissioner for Canada now reports that the date for the receipt of designs has been extended to November 1. Designs in the form of sketch models in plaster on a scale of 1½ in. to the foot should be sent to Mr. Eric Brown, Director of the National Art Gallery, Ottawa, Canada. The design may take the form of a portrait, statue, or a symbolic memorial, and will be judged by the Advisory Arts Council for the Government of the Dominion of Canada. Communications regarding the competition should be addressed to the Secretary, Public Works Department, Ottawa.

Extension of the City of Düsseldorf.

In our issue of September 29, 1911, we published a translation of the conditions of the competition for a town-planning scheme at Düsseldorf. The Prize Committee for judging the plans sent in have awarded prizes as follows:—

First prize to the authors of the design submitted under the title of "Berge romerkye," namely, Professor Ing. Bruno Schmitz, Charlottenberg, and Professor Dr. Ing. Blum, Hanover.

Second prize to the authors of "Am grünen Rhein," namely, Professor Bruno Möhring, Berlin; Herr Fiehl, Town Commissioner for Public Buildings, Bonn; and Herr Rogg, Government Architect, Düsseldorf.

Third prize to the authors of "Und neues Leben," namely, Herr Wöhler, architect, Düsseldorf; Herr Langen, Government Architect, Berlin-Grünwald; and Herr Stahl, Director of Public Works, Düsseldorf.

Fourth prize to the authors of "Jan Wellem," namely, Herr Stubben, Chief Surveyor of Buildings, Berlin-Grünwald; Herr Paffendorf, architect, Cologne; and Herr Strauch, Engineer to the Diplomatic Corps, Berlin.

Fifth prize to the author of "Heimat," namely, Herr von Endt, architect, Düsseldorf. Various other plans have been purchased by the Prize Committee.

Swimming-Bath at Balham.

The premiums offered by the Metropolitan Borough of Wandsworth in the competition for a swimming-bath at Balham are one hundred and five, fifty, and thirty guineas. No assessor has been appointed yet.

Statue to King Edward.

Twelve sculptors have been invited to submit sketch models for a statue to King Edward VII. to be placed in the forecourt of the Hearts of Oak building in the Euston-road.

BOOKS.

Butterworth's Workmen's Compensation Cases. Vol. V. Quarterly Advance Sheets. Part III. Edited by Douglas Knocker, M.B. (London), Barrister-at-Law. (London: Butterworth & Co. 1912. Pp. 130. 7s. 6d. net.)

This instalment of advance sheets of these well-known reports brings the reports of the cases decided under the Workmen's Compensation Act down to June last. When the original Workmen's Compensation Act was extended by the Act of 1906 it was anticipated that the wider extension of the principle of workmen's compensation would result in a lessening of litigation, since many of the artificial restrictions imposed by the Act of 1897 were removed. We cannot but feel that such a result could have been attained had the legislation made better use of the experience gained by the nine years in which the original Act was in force. As it is, the steady flow of litigation continues, as is evidenced by the matter contained in these quarterly advance sheets. The merits of these reports are so well recognised that they speak for themselves. We know of no other legal subject in which the public are given such opportunities of following the latest decisions as are provided by these carefully-edited reports brought so closely up to date.

The Cathedrals of England and Wales, being a Fourth Edition of "English Cathedrals Illustrated." By FRANCIS BOND, M.A. (B.T. Batsford, 94, High Holborn. 7s. 6d. net.)

We take this to be a story of our cathedrals rather than a text-book; a readable and handy volume for those visiting cathedral cities. Mr. Bond's special enthusiasms will surely add to the interest of these occasions. The text has undergone considerable revision since it appeared as "English Cathedrals Illustrated," in fact it has been for the most part rewritten in order to incorporate the results of modern research, which have tended again and again to throw new light on wrong deductions. The illustrations, too, have been thoroughly revised, and a new feature of great value is the series of ground plans of the cathedrals illustrated, all of which have been reduced to a uniform scale. The modern cathedrals of Birmingham, Liverpool, and Truro are included, and the book is as comprehensive as it is enlightening.

We gather, however, that Mr. Bond's predilections favour the mediæval rather than the classic in architecture. He is obliged, apparently, to reduce the plan of St. Paul's to Gothic terms before he can discuss it at all. Yet it was surely the mediæval builder who was the borrower. Wren was only getting back his own. And we do not agree that he should have omitted the attic or "traverse of a clearstory." Much of the vault in St. Peter's is hidden behind the projection of the cornice, and has the appearance of a segmental rather than a barrel vault. Possibly Wren realised the dwarfing effect of the cornice upon his ceiling. Mr. Bond is, indeed, so severely critical at times that one is inclined to recall Lamb's joke:—"Here's Coleridge says he could have written Shakespeare, if he had the mind."

The New Land Taxes and Mineral Rights Duty. The Land Union's Handbook on Provisional Valuations, being general advice to owners of land and house property in dealing with valuations under the Finance (1909-10) Act, 1910, as amended by the Revenue Act, 1911. With Statutes and Forms. (London: Vacher & Sons, Ltd. Pp. 186. 3s. net.)

We have set out the title page of this work in full, for at a time when everyone is inventing some new form of taxing the land the expression "The New Land Taxes" might be misleading. The original MS. was prepared by Mr. Ernest Watson, F.S.I., but in its present form as a handbook additional matter has been added by the Land Union, who have acquired the rights of publication. The work is not controversial in its character, nor is it a legal text-book, but it is intended to provide property owners with a practical handbook.

In the Appendix is printed a full text of the Acts the various provisions of which are explained in the body of the book with marginal references, but not the least valuable part of the work is Appendix II., which contains many valuable notes and suggestions, and the

decisions which have been given on them. These decisions cannot be made too widely known, and should be carefully studied. We have frequently pointed out, on great drawbacks attending such measures as the Finance Act is the impossibility of authoritative decisions. Most Acts of Government were interpreted by the Courts administered according to the legal tradition, but under the Finance Act the decisions obtained appear of no binding authority, the same mistake in valuing other property being perpetrated over and over again. The decisions are only of value in so far as they can study them and found their objections upon them, hence the value of inclusion in the volume before us.

A study of its pages shows how very far a thing "increment value duty" is in from what it was announced in theory when the new taxation was introduced, and at the very moderate price at which it issued should supply a felt want. However, might be somewhat improved.

DANISH ARCHITECTURE. Edited by Varming. (Copenhagen: Ersler & Hasselmann.)

CORRESPONDENCE.

Public Offices (Sites) Bill.

SIR,—Referring to the letter in your issue of July 5 from Mr. Howley Sim, we have inquiries as to the proposed new building towards the Embankment, and have in the plans deposited in the Private Bill with Public Offices (Sites) Bill as amended by the Committee on July 4, and are pleased to say that the promoters have altered their view and have fixed a new line, a line behind that of Whitehall-court and near the river (175 ft. from boundary at north end and 165 ft. at south end).

This is very satisfactory and is evidence of the fact that public opinion may sometimes deter even a Government Department from its first intentions.

The question of the proposed road is in the article and drawing in your issue of June 7 is now being considered by this committee, and it found to be desirable and practical representations will be made in the next quarter.

H. J. LEAMING,
Hon. Sec. London School of Architecture.

St. Paul's Bridge and G.P.O. Ball.

SIR,—A few months ago London classes were eager and persistent in demands that the impressive dome of St. Paul should form a fitting architectural termination to the work of public utility which is being carried out. Under a happier inspiration at the time of the inception of the scheme, great composition might have been produced. The opportunity, realised at too late a date, however, fled, and the vision has vanished dream.

May there not be an awakening to the possibilities that are still within our reach, and to the eventualities which may await us if we do not avail ourselves of the existing opportunity?

St. Paul's Bridge, as finally approved by Parliament, will lead into the City at the end of the Cathedral, and its northern approach will occupy the space between Old Church and St. Paul's Churchyard, covering the ground upon which St. Paul's School formerly stood. Continuing in a straight line into the City, the axis of the bridge and approach would be produced, pass about centrally through the south front of the new building to be erected on the site of the old Post Office, which is being demolished.

There is, therefore, still an opportunity of forming an architectural termination to the new thoroughfare, only less noble and impressive than that which would have been afforded by the dome of St. Paul's. To secure this, two things are necessary, viz., (1) To provide the whole of the narrow block of land between St. Paul's Churchyard and Old Church, and (2) to remove the small block of land bounded by Cheapside, Foster-lane, and the old loading yard of the G.P.O.

with regard to the first of these works, it is proposed to remove the whole of the new block of buildings, but to leave at the northern end, next Cheapside, a long, tapering, wedge-shaped strip of buildings with the thin end facing the bridge, so that, approaching from the Surrey side of the river, the view would be that of the apse of St. Paul's on the left, balanced by the knife-edge of a York Watrion building on the right. This wedge-shaped line of buildings will carry the ground to the left of the axial line, where it encounters, as a terminal feature, the shops Sweeting's corner, backed up by the top of the Post Office, ornamented with the gables of the houses below.

The bridge and the new Post Office may be brought into architectural relationship, to form parts of a complete and homogeneous group, but to consummate such an idea action must be taken at once.

The Postmaster-General, in reply to a question in the House of Commons, stated that he was asked to consider any scheme of improvements that the City Corporation might submit. He said, however, cannot be expected to open indefinitely, and even now, during recess, the offer should be accepted on behalf of the people of London. The matter is one of public interest, and the fact that the rainy season makes it impossible for any final recommendations to be made by the Corporation should not prevent the immediate acceptance of the Postmaster-General's offer. In the absence of any such proposals, the Government may properly naturally assume that the matter is one of indifference. Such, I am sure, is not the case, as if arrangements for commencing the construction of the new Post Office buildings could be delayed for a few weeks a scheme of improvements could be drawn up for consideration by various authorities concerned immediately the recess is over.

It is understood that the services of Sir John Emerson have been retained as architectural adviser in connexion with the new scheme. The thought occurs to me that the likely means of securing a harmonious relationship between the bridge, the Post Office, and the connecting range of buildings in Old London, would be for the City to ask Sir William Emerson to work out a scheme of improvements, in collaboration with Sir Henry Tanner, dividing the whole area between the bridge and the Post Office.

In this way some appropriate setting to Sir Christopher Wren's glorious conception might be achieved. The scheme would, naturally, include the buildings at Nicholson's end of Paternoster-row, which should be set back at some future time, in line with the telegraph office on the west of St. Martin's-le-Grand. A broader and more dignified range of buildings would then form a fitting architectural finish to the west end of Cheapside. The setting back of the new Post Office in line with the telegraph office, and the removal of Sweeting's block, would open out Wren's Church of St. Vedast, a beautiful terminal feature to Newgate-street would thus be preserved.

The opening out of this area would be of considerable assistance in the regulation of the traffic, which will naturally become more congested when the St. Paul's Bridge is built. The Peel statue, with the attendant flower-vases, would be removed to a large central square, some 90 ft. or 90 ft. in diameter. Provision would be made for the formation, at some future time, of the relief road to London Wall from Liverpool-street. The position is unique, such a by-pass road. The Chiswell-street, which has been suggested as an alternative, could not possibly do the same work that a street in this position would accomplish.

The formation of the new road at the east end of St. Paul's will make it quite possible to divert the portion of the Strand and Ludgate-hill which runs along the proposed road, and so relieve the Bank area, as well as Old London-street, Threadneedle-street, and Bishopsgate. At the present time seventy-three omnibuses coming into the Bank area from the west go either direct to Liverpool-street by Moorgate-street and Moorgate-street, or pass Liverpool-street via Bishopsgate. With a system of interchange tickets the whole of the buses could pass to Liverpool-street set along the new road. There would still remain the London Bridge, Stratford, and the plan of buses available for those who wanted to

alight in Cheapside or at the Bank. Passengers could change either at St. Paul's or at the Post Office.

The whole subject is one demanding the most complete and careful consideration. The opportunity is before us, the invitation is open. Shall we avail ourselves of it or let it pass?

ARTHUR CROW.

A Possible Site for the University of London.

SIR.—With reference to your article in the issue of July 28, on the Foundling Hospital site, I should like to bring to your notice another site which should be considered.

The western slope of Pentonville-hill, which includes the area between Baker-street and Pentonville-road, extending east almost to the "Angel," and west practically to King's Cross-road, is a district which seems particularly suitable and within which a site might be found. The situation is high and healthy, and is almost as accessible as the Foundling Hospital.

It is a particularly open area, and includes a number of squares—Lloyd, Granville, Holford, Claremont, and Myddelton—and Percy-circus, with the large open space containing the New River reservoirs. Being ample and architectural, such a site is worthy of a great effort. It is residential and very sparsely covered, so that a large population would not be displaced. The class of property is not valuable, and the leases of a portion appear to be nearly up, while others are probably two-thirds run. An Act of Parliament would be necessary for its acquisition; but why should not Parliament be asked to give the land at least for a national, or rather an Imperial University, as London University should be? O. B. I. T.

The Single Tax.

SIR.—As this is a subject which deeply affects the prosperity of the building trade, it will doubtless be of interest to your readers.

As to the ultimate ideals, whatever may be

the intentions of a few visionaries, their effect will undoubtedly be to rob Peter without any certainty of paying Paul. The relief is to be "gradual," the new impositions are to be immediate and drastic. And at what cost is this relief to be obtained? Every retired tradesman, clerk, or doctor, every spinster lady, widow, or fatherless family that depends upon freehold property for subsistence, is to be ruthlessly expropriated, contracts are to be broken, and all faith in the stability of our institutions shattered. These investors have been the best customers of builders in past times, and the ultimate source from which profits and wages in the building and allied trades are drawn.

The idea that the value of a property depends principally upon surrounding activities is far from the truth. The builder's own activity is a most important element. If this is skillfully directed the property will rise in value; not otherwise. This fact comes out very strongly when a piece of agricultural land on the coast, or at some distance from town, is "developed" and made valuable by advertising and judicious expenditure. But the same principle applies everywhere in some degree, and the profits on investment in houses have never been large when balanced against the losses that continually occur.

H. CLORISTON.

ILLUSTRATIONS.

Port of London Offices.

R. WRAY'S original design for the new head offices of the Port of London Authority was one of the six selected by Sir Aston Webb, R.A., to be carried out in detail for the final competition. We have already illustrated Mr. T. Edwin Cooper's successful design, and the designs of several of the other competitors. Our

Port of London Offices: Block Plan. Competitive Design by Mr. Ernest W. Wray.

reproductions of the drawings of Mr. Wray are, therefore, of interest in comparison. In our review of the competition the following lines appeared:—

"Mr. Ernest Wray has produced a scheme based on a general acceptance of the present frontage to Trinity-square, but the offices, unlike the winning scheme, occupy a rectangular block, leaving somewhat awkward sites for development, terminated at three points by acute angles. This, we should imagine, would, apart from any question of the merits of the plan itself, place it out of court. A vestibule leads to a Salle d'Attente, and this again to the staircase hall, beyond which are placed the Dock and Warehouse Offices and Port Rates Office, which occupy the back part of the block, and from which access is obtained to the back entrance. The Chief Collector's and Deposit Offices are placed in front of the two departments referred to, and the Post and Telegraphists' Offices occupy the front of the building on either side of the entrance. The centre of each side of the block is marked by subsidiary entrances and staircases. The upper floors are well and simply laid out, and the lighting of the various rooms is everywhere good and sufficient. Externally the building is treated quietly and simply, a low tower surmounting the principal staircase, and a colonnade marking the front to Trinity-square. The design shows traces of Greek feeling, and is quiet and unostentatious."

Portland Council Offices.

THIS design, by Messrs. Speir & Beavan, of Cardiff, was successful in the competition held in the early part of the year. Mr. A. Needham Wilson, A.R.I.B.A., was the assessor.

The architects write as follows:—

"The site selected is situated in the New-road, joining the upper and lower portions of the island, and overlooking Lyme Bay and the Chesil Beach. The very sharp slope to the rear—practically 1 in. 3—and the immediate drop of the site from the roadway naturally suggest the treatment followed, viz., that of a long, narrow building, as being most adaptable to the circumstances. The rear elevation of the building is so conspicuously situated as to

demand treatment of equal importance to that of the road front.

The principal entrance, which would, generally speaking, be used for Council and Committee purposes, is centrally placed, and gives access to the main floor comprising the Council chamber, 45 ft. 6 in. by 28 ft., and 19 ft. high to the centre of the curved ceiling, committee-room, and clerks' offices, with a waiting-hall for deputations, and the usual offices. The wall adjoining New-road, being partly a retaining wall, is of additional thickness, and double windows are provided to the Council chamber to assist in deadening the noise of the heavy traction traffic from the quarries on the upper part of the island. Advantage is taken of the thick wall to form recesses and seats in the waiting-hall.

The entrance to the offices will be from the lower end of the building, and on a landing midway between the two floors. A very heavy retaining wall is provided flanking a corridor 7 ft. in width, from which all the offices other than the clerks' department open directly. The sites of the room allotted to the various officials were left in the architects' hands.

The buildings will be erected in Portland stone walling, generally of hammer-dressed rubble work with fair-faced dressings as indicated. The turret will be of wood, lead-covered, and serves to ventilate the Council chamber. Heating by low-pressure hot water, and ventilation on the "natural" system.

The estimated cost of the building is approximately 40,000*l.*"

FIFTY YEARS AGO.

From the *Builder* of August 9, 1862.

Paris.

ON August 8 the inhabitants of Paris are promised the demolition of three theatres—the Cirque Impériale, the Folies-Dramatique, and La Gaîté. Shortly after, the houses expropriated for the completion of the Boulevard du Prince Eugène will be cleared away. Another notice announces the fall of the Couvent des Barnabites, on the line of

the Boulevard de Sebastopol, opposite Palais de Justice. In the Avenue de St. Cloud demolitions are taking place, to engage some of the fine hotels of the Avenue de l'Impératrice and circular street surrounds the Place de l'Etoile. The Boulevard du Roi de Rome, which was some ten or twelve metres below the surrounding surface, and terminated by a flight of thirty steps, is now in course of excavation throughout its entire length. Hundreds of labourers are employed levelling and raising the heavy escarpments of sand, gravel, the earth from which is carted to the low ground of the Seine.

** The Folies-Dramatique and La Gaîté, whose demolition is here alluded to, are memorable for the original production of "La Fille de Madam Angot," "Orphée aux Enfers" respectively, and such light opera that took London by storm in the early seventies. "La Fille de Madam Angot" was carried to the Philharmonic near the Angel, and Islington for months became nightly a part of the end. Offenbach was at one time director of the Gaîté. This theatre, established in 1760, and was destroyed in 1835, the new building which replaced it, having, in its turn, to give way to the demands of the new Boulevard du Prince Eugène, as stated.

The Cirque Impériale, now known as the Châtelet, possessed the interest of having been opened, in 1780, by "un Anglais" named Astley, who ran a programme, including "un spectacle voltigeux," by which we understand rope dancing. Astley's Theatre, in Westminster Bridge-road—now, too, a thing of the past—and the tragedy of "Mazeppa" which drew crowded houses during its days, will be within the recollection of our readers.—Ep.

Fig. 1. Royal Insurance Building, Lombard-street.
Messrs. Gordon & Gunton, F.F.E.I.B.A., Architects.

ROYAL INSURANCE OFFICE BUILDING, LOMBARD STREET, E.C.

new building constructed as the headquarters of the Royal Insurance Company, Ltd., from the designs of Gordon & Gunton, the architects, is on the south side of Lombard-street, between Clement's-lane and Nicholas-lane. The building has a length of 94 ft., in addition to the frontage, 15 ft. and 8 ft. long respectively; the frontage is 97 ft. long, and the frontage is 33 ft. long. Thus the length of the frontage is 247 ft. The building is of L shape, and behind it is that by the National Bank of Scotland. On the narrowness of the street it is not to take photographs showing the main front in a satisfactory manner, two views reproduced above give a general idea of the building and its effective in the architectural perspective of

readers will see for themselves (Fig. 1). The building has been designed in the Italian style, the composition being of strength and dignity, and bearing of French influence in part of the

the level of the first-floor window-sills are faced with grey Aberdeen granite, by Messrs. J. Fyfe, Ltd., of Aberdeen, the same level with Portland stone. The domed turrets at the ends of the

Lombard-street façade the masonry is surmounted by a mansard roof covered with Westmorland green slate, this roof being continued along the ends of the building in Clement's-lane and Nicholas-lane.

The whole of the carving was executed by Messrs. Gilbert Seale & Son, of Camberwell.

The construction embodies the steel-frame principle recently sanctioned in economical forms by the 1909 amendment of the London Building Acts. The steel frame is of British steel throughout, and was erected by the Aston Construction Company, Ltd., of London. It is cased with concrete and clothed with brickwork and masonry, but the entire weight of these materials and all other dead and live loads are carried by the steel skeleton, which includes some 800 tons of steel, and was erected in six months.

One important result attending the adoption of this system has been considerable increase of floor areas and interior space generally, as compared with those that would have been permitted in the unregenerate days of the London Building Acts.

The architects have also made use of reinforced concrete, as designed by the Considère Construction Company, Ltd., of Westminster, in the form of retaining walls and floors.

To illustrate the subjoined notes we reproduce, in Figs. 2 and 3, two of the architects' drawings,

one being a plan of the ground floor and the other including three sections of the building.

It will be noticed that the premises comprise seven stories in all with a mezzanine floor between ground floor and the first floor. The building is 73 ft. high above street level, and 96 ft. high from foundation level, measurement being taken in each case to the top of the flat roof.

The sub-basement and basement stories are bounded on the three streets mentioned by retaining walls constructed under the kerb line of the roadways so as to permit the ground beneath the footpaths to be excavated, and thereby to increase the accommodation in the two lower stories of the building.

The retaining walls are about 23 ft. high by 21 in. thick in the sub-basement, and 10½ in. thick in the basement, the profile being as shown in Fig. 3.

By adopting reinforced concrete instead of brick or plain concrete for these walls the architects have been able to add a strip from 5 ft. to 6 ft. wide along the whole front of the building. As this strip applies to the two stories mentioned it represents the additional area of nearly 2,470 sq. ft., which is worth a great deal of money at the high price of land in the City.

In order to provide support for the exterior lines of steel stanchions carrying the front walls of the building and a large proportion of the

Fig. 2. Royal Insurance Building: Ground Floor Plan.

floor loads the base of the retaining wall was constructed to act as a girder foundation, as illustrated on page 720 of our issue for June 9, 1911.

The section there given includes a profile

of the retaining wall, and shows the arrangement of the steelwork in the two basement stories. The stanchions have heavy brackets riveted to them below ground-floor level for supporting the granite piers in the front walls,

an arrangement which obviated carrying the masonry down to the ground with consequent loss of valuable space. Reinforced concrete was also em-

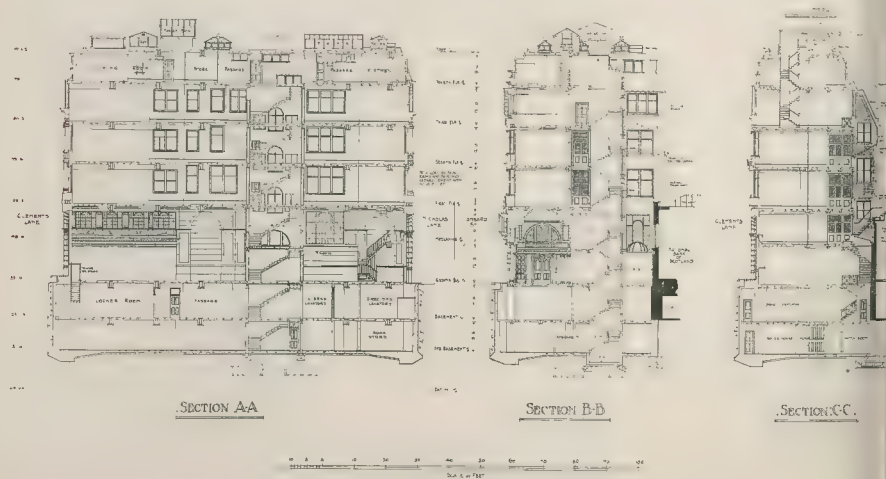

Fig. 3. Royal Insurance Building: Longitudinal and Cross Sections.

of footings for all the interior thereby saving a considerable of excavation and materials, as the concrete footings are far less bulky than of plain concrete or steel grillages in concrete.

retaining walls, as well as the walls on the north side of the building, were lined with asphalt by the Limmer Asphalte Company, Ltd., of Westminster, with that the lower portion of the may be compared to a large water-tight compartment, or tank, affording perfect protection against the penetration of moisture, and the basement floors were carefully treated.

basement affords ample space along the street side for the storage of books. In the book store a reinforced concrete strong-room has been constructed, compartments, each 10 ft. 6 in. by 6 ft. 6 in. A hoist is provided placing the book compartments with the offices on the ground floor. The store is also accessible by a staircase leading down from the street. It should be noted that this store is isolated from the remainder of the building by a fire-resisting wall.

adjacent part of the same story are part of the passenger lift walls, the rest of the main staircase, and a room at the head of an artesian well, sunk by Messrs. Williams & Co., of Bow. The well is furnished with an automatic pump and will enable the company to make considerable annual saving by the excessive rates charged to command professional firms in London owing to the artificial method imposed upon the water supply by the London Water Board by legislation.

The well is 450 ft. deep, and the water is pumped into tanks on the roof having a storage capacity of 15,000 gallons. The end of the sub-basement in Clement's-lane is situated the boiler-house, engineers' workshop for two passenger lifts, on vacuum, cleaner plant, supplied by Messrs. Vacuum Cleaner Company, Ltd., and a paper store.

basement story is well lighted by pavement and reflectors. At the Nicholas-lane end is the Board-room of Messrs. Farner & Brindley, with lavatories for staff and staff. The middle part is devoted to storage purposes, and at the Clement's-lane corner further lavatory accommodation is provided for clerks, with an adjoining range of lockers.

remainder of this story along Clement's-lane is occupied by a stationery store, copying-room, and a lavatory, and a room for ventilation apparatus. The entrance opens upon the street by a boldly proportioned doorway. This entrance opens upon the street and the gallery at mezzanine level.

terior of the lobby is in marble executed by Messrs. Farner & Brindley, of Westminster. The pillars are in Greek style, the caps and bases in bronze, the architraves to the doors in choice marble, the cornices and the dome in quarry, the archivolts in choice Ponzonzo marble, the soffits in the same material with Zudda panels. The paving is in black and

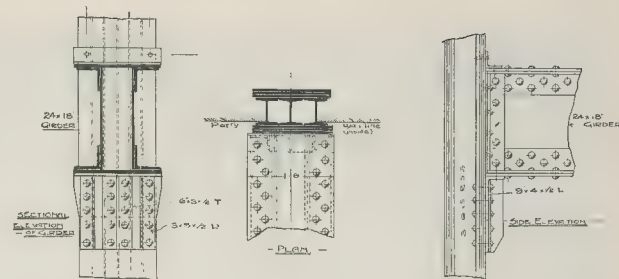

Fig. 5. Royal Insurance Building : Detail of Stanchion in Party Wall.

white marble laid to the geometrical pattern of which part may be seen in Fig. 6.

The main staircase is lined throughout with second statutory marble by the firm mentioned, the ornamental iron double lift fronts and the main staircase lift well enclosure with moulded bronze handrailing, having been executed by Messrs. W. T. Allen & Co., of Queen Victoria-street.

At the right hand of the entrance lobby are private offices for the directors, manager, and clerks, a handsome private staircase (see Section AA, Fig. 3) leading from the clerks' office to the mezzanine floor. The ornamental iron balustrading with moulded bronze handrails for this staircase were executed by Messrs. W. T. Allen & Co.

Turning to the left from the entrance lobby the general public office is entered, this being a spacious hall lined with marble and admirably lighted by bronze-framed windows of exceptional size (Fig. 7). The walls have a dado of genuine Verde Antico marble, from the ancient quarries of Thessaly, with a plinth of black and white marble, and the lining above the dado is of second statutory, with panels of choice Ponzonzo marble. The space for use by the public between the counters is paved in black and white marble. This marble work was executed by Messrs. Farner & Brindley.

Fig. 7 also illustrates the decorative treatment of the panelled ceiling, the ornamental plaster work here and elsewhere in the building having been done by the Bromsgrove Guild.

At the far end of the office there are two passenger lifts for the use of the staff, a goods hoist, and a staircase providing communication between all floors from the sub-basement to the mezzanine, and finishing with a fire-escape flight to a flat roof at first-floor level.

The ornamental iron lift fronts and stair balustrading were supplied by Messrs. W. T. Allen & Co., and all the lifts and hoists in the building were furnished by Messrs. R. Waygood & Co., Ltd. The four passenger lifts are operated by electric motors, and are fitted with the usual safety appliances and car switch control. Each car holds seven persons and is arranged to travel at the rate of 220 ft. per minute. The total travel is 85 ft. The goods hoists are of the direct-acting hydraulic type, capable of dealing with loads up to 10 cwt., one travelling from sub-basement to street level and the other from sub-basement to ground floor.

The purposes to which the upper floors are devoted may be briefly summarised as follows:

Mezzanine Floor.—Secretarial department, including a suite of five offices, with inquiry and waiting rooms and an adjoining board-room. These are at the Clement's-lane end of the building. At the Nicholas-lane end other offices are provided above the managerial department.

First Floor.—Sub-divided and arranged for use as offices according to requirements.

Second Floor.—Accident and fidelity guarantee offices at Clement's-lane end; general and private offices at Nicholas-lane end.

Third Floor.—Commencing at the Clement's-lane end, offices are provided for inspectors, profits department, country agents and country branches department, loss department, accounts and renewals department, classification department, medical officers' room, general and private offices.

Fourth Floor.—On this floor are dining-rooms for clerks, secretaries, and heads of departments, a well-appointed kitchen department, living-rooms and domestic offices for the caretaker, and extensive ranges of lavatories for all grades of the office staff.

Roof.—On this are six water tanks, two motor-houses for lifts, outlets for various ventilation shafts, and two escape stairs to the roofs of adjoining buildings.

In designing the upper portion of the building the architects made every effort to secure the maximum amount of floor area on every story, and to provide for the admission of daylight in the most effective manner possible.

The first of these objects is attained in part by the reduced wall thickness permitted by adoption of the steel frame type of construction and in part by other means. For example, the building is carried up sheer from the pavement, without plinth or set-backs, as in the old building, the outside face of the wall at third-floor level being linable with that at the ground floor. The steel stanchions were specially designed so that they should not cause projections beyond the face of the walls, and those coming against party walls are of special shape, so as to permit them to be completely embedded.

Bay windows have been constructed wherever possible on the upper floors, and the chamfered angles at Clement's-lane and Nicholas-lane serve a useful purpose in admitting light from the east and west, particularly from the latter direction.

Light is admitted at the back of the building by ordinary windows where possible, and also by domes, lean-to roofing, and roof lanterns. Two barrel-shaped dome lights, with barrel ends, a large lean-to roof light, and seven roof lanterns were glazed by the British Challenge Glazing Company, Ltd. In the domes the glass is stained Decouvert, in the lean-to the wired polished plate has been used, and in the roof lanterns the patent glazing of the firm with lead-covered steel bars was adopted.

Lead-glazing of distinctive design for some of the principal windows was executed by Messrs. W. James & Co., of Willesden Junction, the large size of many of the windows having necessitated special treatment, provided for by the patented system of strengthened leaded glazing, which is a speciality of this firm.

The floors used throughout the building are of reinforced concrete filled in between rows of hollow tiles, and were specially designed by

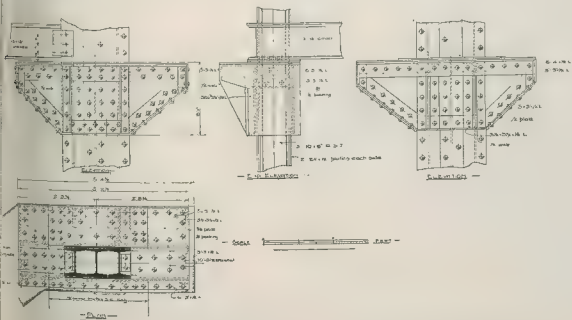

Fig. 4. Royal Insurance Building : Detail of Bracket under Pier.

Fig. 6. Royal Insurance Building, Lombard-street: Entrance Hall.

Messrs. Gordon & Gunton, F.R.I.B.A., Architects.

the Considère Construction Company, Ltd., the total finished thickness being only 9½ in. By using these thin floors considerable space has been saved and added to the height of the various stories.

There are no intermediate supports to the main floors, the spans being independent of columns and carried by heavy girders from wall to wall. These girders average 40 ft. long between supports, and are of considerable size, those in the mezzanine floor weighing 16 tons each.

The floor girders were kept as shallow as possible, one twenty-fourth of the span representing the depth in all cases.

We are informed that before the Considère type of floor was adopted two 15-ft. spans continuous over a central support were made and tested in the presence of Mr. H. Percy Gordon, of Messrs. Gordon & Gunton, the

architects, and Mr. Elliott, representing Messrs. Trollope & Colls, the building contractors. It is stated that even when loaded to destruction no cracks were developed over the joists which formed the centre support between the two spans, a fact pointing to the suitability of the floor for granolithic, terrazzo, or mosaic covering.

Except in places where marble paving and other special floor surfaces have been laid, the floors are covered, to the extent of some 4,000 sq. yds., by Duffy's patent "Immovable Acme" woodblock flooring in pitch-pine, laid by the Acme Flooring and Paving Company (1904), Ltd.

In addition to the work previously mentioned, the Limmer Asphalte Paving Company covered the whole of the roof and the domes under the stonework with their Seyssel asphalt, ¾ in. thick in two coats, the area in all being one acre approximately.

Among other firms by which materials were supplied are the Brick Company (glazed bricks), Messrs. Durrant & Co., Ltd. (tiles and terrazzo), and the Iron Company (London), Ltd. (Birmingham). The building is heated throughout by a low-pressure hot-water system of accelerated circulation. The boiler is of a sectional type in duplicate, and radiators are provided with fresh air drawn from the roof for ventilation.

The ground-floor basement and the first and second stories are ventilated by a combined plenum and exhaust system. The air is drawn in from the roof of the building and after having been washed and warmed, is distributed through main ducts. Vitiating air is extracted by shafts by the aid of electric fans placed above the roof.

SANATORIUM MODIFICATION, SURREY.

re County Council at their last
sidered a Report on the treatment of
s under the provisions of the National
Act, and they decided to authorise
Health and Housing Committee to
p to 5,000. during the next three
the provision, equipment, and
four chief dispensaries and a county
dial laboratory, and also the hiring
sanatorium and hospital accommo-
dation permanent arrangements. In
time the scheme which was adopted
Council contemplates the provision of
accommodation, and the establish-
ment of tuberculosis dispensaries in convenient
with sub-dispensaries serving the
districts attached to each centre.
ed to the cost of the scheme, the
elay on the adaptation and the
of houses and provision and apparatus
for chief dispensaries is estimated at
of sixteen sub-dispensaries 800. It

is proposed to establish a laboratory, but this
matter is to remain in abeyance for a time.
Omitting the cost of this, Dr. Jones summarises
the capital outlay for the whole scheme as
26,900., and the annual cost as 22,680. A
contract was sealed with Praed Road Construc-
tion Syndicate, at 2,010., for laying 1,197 yds.
of main road at Ham with Mexphalt asphalt.

CONSTRUCTION NOTES.

M. CAMILLE MATIGNON describes
the spontaneous and pro-
gressive destruction of certain
Lead Objects.

objects made of lead. For
example, ancient lead objects preserved in
museums often gradually crumble to a fine
powder consisting essentially of the carbonate
of lead. It has been found that when such
destruction has taken place, chlorides are also
present in the powder. Experiments with lead
which had been immersed in a 30 per cent.
solution of sea salt, and then dried so that
crystals of salt hung to it, proved that pro-
gressive destruction took place over a period of
three years of testing. A blank experiment
with lead which had not been dipped into such
a solution showed no destruction over the same
period of time. The author offers the following
series of actions as the most likely explanation
of the destruction referred to, and the results of
his experiments. The lead under the combined
action of the oxygen and carbon dioxide of the
air, in the presence of common salt, produces
sodium carbonate and lead chloride; these
last two interacting to produce lead carbonate
and reproducing the common salt.

In such a course a little of the extraneous
ingredient, common salt, may have a prolonged
effect, a result not without analogy in other
chemical interactions. Inasmuch as sea-spray

is carried in the air for long distances from the
seashore, having been detected by the usual
tests for common salt, this is a factor that may
often have to be reckoned with in the durability
of lead-covered roofs.

Coating lead objects which are in the process
of destruction with a collodion varnish retards,
but does not do away with, the destructive
process; and even washing them with boiling
water until the wash-water does not give the
test for chlorides is of no effect.

Messrs. Clay & Sons' New Premises.

We are informed that the
whole of the electro-copper
fire-resisting glazing, covering
some thousands of square
feet, in this building was
supplied by Messrs. Hayward Brothers &
Eckstein, Ltd. (See the *Builder*, July 26, 1912.)

The glazing in question, termed "Copper-
lite" by the patentees, was tested in February
last by the British Fire Prevention Committee,
the object of the first test having been to record
the effect of a fire of 60 minutes' duration on
three windows, the temperature to reach
1,500 deg. but not to exceed 1,650 deg. Fahr.,
followed by the application of water for two
minutes on the fire side of the windows.

Although the glass was cracked, it remained
in position, and the glazing proved its efficacy
as temporary protection by preventing the
passage of fire from one side to the other, and
two of the windows also proved capable of
intercepting water.

A second test of three similar windows was
undertaken to record the effect of a fire of
ninety minutes' duration, the temperature to
reach 1,600 deg. but not to exceed 1,800 deg.
Fahr., followed by the application of water for
two minutes on the fire side. This test was
equally satisfactory, and the windows were
classified as affording partial protection.

THE BUILDING TRADE

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS OF GREAT BRITAIN AND IRELAND:

SUMMER MEETING AT NOTTINGHAM.

THE half-yearly general meeting of this Federation was held on Tuesday, Wednesday, and Thursday of last week at Nottingham. On Tuesday afternoon the Executive Council met in private, and in the evening there was a dinner at the Victoria Station Hotel. The general meeting was held on Wednesday at the Exchange Hall, and in the afternoon the delegates and their wives paid a visit to Nottingham Castle at the invitation of Sheriff Pycroft, while on Thursday there was a picnic to Sherwood Forest, lunch and tea being taken en route.

Mr. James Wright, the President, was in the chair at the general meeting, at which there was a good attendance of delegates, the following representatives being present from South Africa.—Mr. P. Prentice (President), Mr. J. T. Brown (Secretary), and Messrs. Douglas, Evans, Kelly, Wilkinson, Mathew, and Alderson.

At the opening of the proceedings, Sheriff John Pycroft, in the unavoidable absence of the Mayor, Councillor Edwin Mellor, extended a civic welcome to the delegates to Nottingham. In the course of his remarks he said the Federation was one of the most important bodies in the kingdom, as it embraced in its ranks not only builders, but plumbers, stone-masons, and other allied trades. To a certain extent he considered that combination was good both for employers and employees, especially if conducted in a reasonable and straightforward way. He was sure they all deeply deplored the labour unrest that existed, and they all hoped the time was not far distant when things would settle down. He believed that employers generally were quite willing to give their employees a living wage, but the great difficulty was to say what was a fair minimum. He heartily welcomed the Federation to Nottingham, and trusted the delegates would derive pleasure as well as profit from their visit.

Councillor E. A. Atkey also addressed a few words of welcome.

The President, having suitably acknowledged the kind words of Sheriff Pycroft, said it was his pleasure to extend a hearty welcome to their friends from South Africa. He believed he was correct in saying that the South African Building Trades Federation had only been formed about seven years, and that was the fifth occasion upon which they had sent representatives to their summer meeting. It was a great pleasure to know that the builders in South Africa had formed a united Federation, based mainly on the principles of the National Federation.

Mr. J. Prentice said that as President of the South African Federation he could assure them that they took it as a very high compliment to the builders of that colony that the English Federation should welcome them in the fashion they had. He regarded it as a great privilege to be among such a body of business men, and he was sure he and his colleagues would learn much which they could take back with them. Those living in England did not recognise the great changes that were taking place in the old country in the same way as did they who only visited here occasionally. Coming to this country after an absence of something like twenty years, he could see the great and drastic changes that were taking place. He was not going to say whether all those changes were for the better or not, but he thought they would all agree that there was too much aggressive legislation, which interfered with the freedom of employer and employee. A progressive sentiment prevailed at that gathering, and he was glad to say the same spirit was abroad in South Africa. In that country they had got the cream of the trade in their organisation, and he had no doubt that was the case in this country with the National Federation.

Mr. Douglas also thanked the Conference for the welcome afforded to himself and his

colleagues from South Africa, and said they would go back helped in their work of trade organisation. They had an annual Congress of members of the building trades in that colony, and they had been successful in securing many benefits to the trade in general.

Mr. J. T. Brown also briefly thanked the Conference for its words of welcome.

Mr. A. G. White (Secretary) then read the sixty-sixth half-yearly report. This stated that two meetings of the National Board of Conciliation had been held since the last report. The chief matters decided were: An appeal from Leeds, which resulted in favour of the employers; an appeal from Birmingham as to the interpretation of the rule relating to demolition work, when it was decided that such work was builders' labourers' work down to floor level, but not the removal of material or excavation. Two meetings had been held of the National Joint Committee of Appeal under their agreement with the N.A.O.P.; in the matter of an appeal from Birmingham an advance was granted the plasterers to 10½d. per hour, and the rules settled except as to the overtime rule, which was referred back for further consideration locally; the parties, however, failed to agree, and the matter was eventually settled by the National Joint Committee. In an appeal from York on the walking time rule a decision was given that the rule must remain unaltered until fresh notice. A meeting of the National Demarcation Committee was also held, and deal with an appeal from Manchester. The case was a difficult one on account of the sharp conflict between the interests involved. Eventually a unanimous decision was arrived at by which the floating of any work which may have to receive a finishing substance (except asphalt) was agreed to be plasterers' work, all granolithic work to be done optionally by plasterers or concretors, all vertical or soffit work to be done by plasterers, floors finished for paving blocks in engineering works, etc., to be concretors' work. The Midland Central Board heard two cases, one went to the National for final settlement, the other granted an advance of wages to the carpenters and joiners at Sutton Coldfield (9d. to 9½d.). Some trouble had been experienced at Bristol, where the plasterers struck on the question of wages, having refused the offer of a halfpenny. The employers stood firm, and eventually the men agreed to accept the offer, it being understood that they were to be allowed to raise the question of a further advance later on. From reports received it was apparent that a general rise of wages of about a halfpenny per hour was in progress. In some few cases 1d. had been conceded, and in others only a ½d. The National Insurance Act continued to demand a great deal of time and attention from the Federation. The regulations issued for the carrying out of the detailed administration had been carefully examined, and where deemed likely to prove irksome to their members amendments had been secured. Especial attention had to be given to the question of responsibility for the contributions of sub-contractors. There was an inclination to place this responsibility upon the sole contractors, but eventually it had been arranged that unless the sole contractor was entitled to the exclusive services of the sub-contractor's men the latter remained responsible for the contributions of his men. The numerous applications to the umpire for decisions as to whether certain classes of men were of a class in respect of which contributions should be paid had needed constant supervision, much correspondence, and numerous attendances before the umpire in order to prevent the exclusion of classes of men in the service of firms or public bodies not engaged in the building trade, but engaged, all the same, on work commonly carried on by building trade firms. It was obvious that unless the workmen employed by such private firms or public authorities were brought under the Act a most unfair kind of competition would arise, to the detriment of the building trade, and the efforts of the representatives of the Federation had been fairly successful in averting this. There were, however, still many decisions to be given, and continued vigilance would be necessary.

The President, in proposing the adoption of

the report, said he thought they were all with him that it covered a great deal, and he could assure them that the President tended to become very exacting, and took up a great deal of time. Since they did him the honour of attending to that office he had attended to forty meetings of various kinds, two of which were held in London. He also attended the annual dinners at Sheffield, Bristol, Bath, Leicester, Eaton, and wherever he had been warmly received, and the utmost had been shown towards the Federation was at the Town Planning Conference he made a remark to the effect that he did not think they were giving sufficient attention to the difficulty that existed in the housing of the poorest workers in large centres, and he suggested that the matter should be approached in the municipalities might be subsidised, the purpose of providing cheaper dwellings for lower-paid workers. He had a great deal to say regarding the suggestion of Smethurst, who was a member of the Federation. He had also attended the Mansion House on profit-sharing partnership, at which Earl Grey was present, and he was bound to say that the impression he gathered was that the great opening for the adoption of profit-sharing. His Lordship pointed out that the matter positively be made to pay because he told by large employers of labour, quite possible for many workers to get 20 per cent. more work than the injury to themselves. It was a great importance, and one which the Federation might give a little attention to, and, if thought desirable, a committee appointed to make inquiries at another meeting. The report came to the great demands that had been made on the officials of the Federation by the Act, and they had offered strenuously to the exemption from the unemployment of the Act of men in the service of public bodies who, although not engaged in building trade, were engaged on work commonly carried on by building trades. He was sorry to say that according to the report of Trade figures there did not seem much prospect of improvement in the future. With regard to the general question among the labouring classes he observed for one moment that the workers were something with discontent, and on the eve of a great industrial strike. He had too much respect for public confidence in the British workingman to make such a statement. There was no doubt the price of food had risen considerably the last few years, but it was also true that it had been from a state of abjectness, and if they would go back to the condition they would find that food was cheaper to-day than they were thirty years ago. Turning to the fact that they often heard great complaints of defects for including an increasingly large number of prime-cost items in their contracts, he said he only wished to say that the Federation would be able in the future to do something to remedy this. His opinion was that the remedy was in their own hands, and that the way the practice was to put plenty of goods on them charge the architects 10 per cent. everything they included in the contract and if that did not reduce it less than 15 per cent. One of their members had said that they would find it difficult to get all builders to do it. He quite agreed that it would be difficult, but he thought the Federation had overcome greater difficulties than that, and if they would only he was sure they could get over that kind. Another question was the Workmen's Compensation Act, and the burden it was casting upon the trade. He had not got definite information, but he was sure he was well within the mark when he said that the premiums for the Act had doubled within the last few years.

HOUSING IN RURAL DISTRICTS.

In the House of Commons, on July 30, Mr. Charles Bathurst asked the Prime Minister whether Lord Strachie gave utterance to the views of the Government when he recently stated at the annual meeting of the Rural District Councils' Association that the Housing, Town Planning, etc., Act, 1909, did not meet the wants of purely agricultural districts, and that it was desirable to apply the principles of the Labourers (Ireland) Act, 1906, to England, in order to accelerate the provision by such Councils of additional cottage accommodation for agricultural labourers; and, if so, whether, in view of the urgency of the matter, it is proposed to introduce this session legislation of the character indicated? Mr. Asquith, in reply, said that Lord Strachie was expressing his own views in the matter. The Government do not propose to introduce this session legislation of the kind suggested.

On the same day Mr. Charles Bathurst again asked whether attention had been called to the annual Report of the Medical Officer of Health for the Market Bosworth Rural District Council; whether, according to such Report, out of 558 dwelling-houses inspected in that area in 1911, defects were found in 355, and five closing orders were made, ten dwelling-houses closed, and three demolished, whilst the excess in the number of births over deaths was 373; and what action, in view of these facts and the decision of the Rural District Council in question not to take action in supplying the housing deficiency in their area, was intended to be taken? Mr. Burns, replying, said that his attention had been called to the Report mentioned, and he was in communication with the District Council on the subject. Lord Henry Cavendish-Pentland asked what action is being taken by the Rural District Council of Bridlington to provide accommodation in their district under the provisions of the Housing Acts, in view of the fact that the Sanitary Inspector reports that eighty-six cottages are too antiquated and worn out to be servicable, whilst he reports that thirty-five further dwellings are such as cannot, without danger, be occupied any longer, and they should be properly vacated before another winter season; and whether, under these circumstances, the President will inquire into the case, and take action if the Rural District Council has not yet taken steps to remedy the deficiency? Mr. Burns, in connection with the previous reports of the Medical Officer of the district, I addressed communications to the Rural District Council as to the need for the provision of houses under Part III. of the Housing of the Working Class Act, 1890. The further consideration of the question was reserved pending a survey of the district by the local Sanitary Inspector. That survey has recently been completed, and the report of the inspector from which the figures mentioned in the question are taken is under the consideration of the Council. A copy of the report was sent to me a few days ago, and the matter is engaging the further attention of my housing department.

GENERAL BUILDING NEWS.

CONGREGATIONAL CHURCH, PENGE.

This church is being erected at a cost of about 9,000*l.* by Messrs. Jones & Andrews, contractors, of Beckenham. The building will have accommodation for 600 people, and the nave will be 80 ft. long. The architect is Mr. P. Morley Horder, F.R.I.B.A., of London.

CHURCH EXTENSION, HALE.

Messrs. Martin Stone & Sons, of Altrincham, are the contractors for the extensions which are being carried out to the Congregational church in Ashley-road. The estimated cost of the work is 9,000*l.*, and the architects are Messrs. France & Laycock, of Manchester.

MEMORIAL CROSS, WINTERBOURNE.

A memorial cross has been erected at the parish church of All Saints, Winterbourne Down, at an estimated cost of 150*l.* The cross is composed of blue pennant stone and is 13 ft. high. The work was executed by Messrs. Harry Hems & Sons, of Exeter.

WATERWORKS, LOCH BRADAN.

The new waterworks which have been constructed at Loch Bradan for the supply of water to Troil, Prestwich, and the surrounding district were built from plans prepared by Mr. John Eaglesham, C.E., engineer, of Ayr, and the contractors were:—Constructing dam and laying first section of conduit, Messrs. Neil MacLeod & Sons, Edinburgh; providing and laying cast-iron piping of second, third, and fourth sections, Messrs. D. Y. Stewart &

Co., Ltd., Glasgow, concrete tubes for conduit, Messrs. John Ellis & Sons, Ltd., Leicester; valves and fittings, Messrs. Glenfield & Kennedy, Kilmarnock. The cost of the work is estimated at 90,000*l.*

WORKHOUSE INFIRMARY, BANGOR.

Bangor Guardians have decided to accept the tender of Messrs. Thornton & Sons, of Liverpool, for the erection of their new infirmary, the amount of the tender being 17,589*l.* The building will provide accommodation for 114 beds, and the architect for the work is Mr. F. Bellis, of Bangor.

POLICE-STATION, READING.

Mr. Slingsby Stallwood, F.S.A., is the architect for this new building which was opened on Thursday last week. The contractors for the work are:—For the building work, Mr. McCarthy E. Fitt; hot-water work, Mr. James T. Spencer; electric lighting, Messrs. Haughan & Co. Mr. James Tegg was clerk of the works.

WORKMEN'S DWELLINGS, THETFORD.

The Thetford Town Council are about to erect fifty cottages in Bury-road from plans prepared by Mr. Stanley J. Wearing, A.R.I.B.A., architect, of Norwich. The builder is Mr. E. Clark, of Melton Mowbray.

NEW BUILDINGS IN LONDON.

Seven houses, near Headstone-lane Station, Hatch End, Hendon, N.W.; Mr. Edward Mackie, estate agent, L. and N.W. Railway Company, Euston Station, Drummond-street, N.W. Theatre, West-street, Shaftesbury-avenue, W.C.; Mr. J. Herbert Jay, managing director, Ambassadors' Syndicate, Ltd. Enlargement of school, Victoria-road, Peckham (370*l.*); Messrs. G. Parker & Sons, builders, 124, Sumner-road, Peckham, S.E.

TREDEGAR HOUSE, BOW-ROAD, E.

Mr. Rowland Plumble, F.R.I.B.A., was the honorary architect of Tredegar House, the London Hospital Training School for Nurses, which was opened in Bow-road by Queen Alexandra on July 19. The buildings have been erected at a cost of 12,000*l.*, and afford accommodation for thirty nurses in training. We understand that Mr. Plumble contributed 5,000*l.* towards the building fund.

TRADE NEWS.

Mr. J. S. Alder, of 1, Arundel-street, Strand, is the architect for additional classrooms at St. Barnabas Church Hall, Homerton, now being erected by Messrs. E. A. Roome & Co., of 36, Basinghall-street, E.C.

Mr. B. E. Nightingale, Lambeth, has obtained the contract for building some large private residences at Chapel-road, Tadmort, Surrey.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Queen's road Church, Broadstairs.

Messrs. S. H. Morden & Co., of 11, Tothill-street, Westminster, have opened offices at Broad Sanctuary-chambers, 11, Tothill-street, Westminster, and have been appointed sole London agent to the firm of Musgraves (Liverpool), Ltd., and Newcastle-on-Tyne, sanitary engineers and manufacturers of "Invicta" porcelain enamelled fireclay ware and other sanitary appliances for use in hospitals, schools, etc.

The New Isolation Hospital, Staines, Middlesex, is being supplied with Shorland's patent warm-air ventilating Manchester stoves with descending smoke-flues, patent exhaust roof ventilators, and special inlet ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Construction.

Hackney, Central.—Temporary coffee-stall in front of No. 345, Kingsland-road, Hackney (Mr. W. J. Jordan).—Consent.

Paddington, South.—Iron and glass covered way in front of No. 38a, Porchester-terrace, Hyde Park (Mr. A. B. Gutmann).—Consent.

Mile End.—Projecting crane at Crown Works, on the north-eastern side of Bancroft-road, Mile End (Mr. J. M. Knight for Mr. H. Roberts).—Consent.

Norwood.—Temporary wood and iron building in front of No. 12B, Norwood-road (Mr. E. Carr for Mr. W. Haley).—Consent.

Probably that was so, and in face of causes to which they were now being subjected it was a seriously increasing fact that the Federation was not without the ability to do something in the near future at the cost of the administration.

He believed he was correct in saying for every 100*l.* they paid in compensation they had to pay about 50*l.* in expenditure, although the Act was good in principle, it was not possible to administer it so cheaply.

Mr. Easton seconded the motion. He reported the meeting would not be without the expression of subsidising for housing purposes. He (the President) did not believe in that policy, for the fact that in his experience he had found it to be a benefit to anyone. It might be in theory, but when it came to practice they found that a municipality, through a committee who were mostly amateurs, could not build any cheaper than enterprise.

Mr. Easton said he hoped he did not intend that he was in favour of subsidising. All he wanted to convey was that he thought it would be well if either a municipality or anybody else could borrow money for the specific purpose of building for the very poor.

Mr. Easton said that those who advocate the principle enunciated by the President was a perversion of proper economy, but they felt that the method in which the people of the country were being treated was a menace to those who were better off. (Mr. Smethurst) had a scheme of good builders should be able to get cheap land for the purpose. Mr. Whittall (Birmingham) said that the municipality had to contend with this in municipal housing was the selection of sites. It was very nice to say that it was to provide for the housing of the poor, but the plain fact was that the municipality had that class of persons in its midst, for the very good reason that they got no rents from them. The class they got was those who were paid very little and by providing cheap dwellings at a small expense they were simply subsidising employees. Their experience was that wages followed house rents, and house rent went up so would wages. To get real social improvement was to get to be paid a reasonable and not a small amount.

Mr. Hope (Sunderland) referred to the fact that the Board of the Compensation Act, said that one of the objects of the insurance companies was to have no maximum limit for anything but an accident.

Mr. Woods (Bolton) said he hoped that as a result of the President with regard to the insurance would not blind them to the fact that there was a very big movement in the building trade amongst the employers to form one combined federation, and they could attack in one large body in detail. They in Lancashire and in other parts of the country had not come to the point of coming for many years, and were only surprised it had not come earlier. His purpose in rising was to say that the National Federation should try to get various associations to use that power to get all members of the trade together, and he would like to see London and the other sub-contractors and members of the trade in their organisation.

Mr. Easton said he agreed with Mr. Woods in the fact that the workmen in the trade were seeking to combine in order to act as an incentive to all others to join their local association. The report was adopted.

Work will be concluded next week.)

MUSIC HALL, GUILDFORD.

Proposed to erect a hippodrome, to accommodate for 1,500 people. Mr. J. H. Holmes-street, Cavendish-street, has been appointed architect for

ORIA AND ALBERT MUSEUM.

to the annual Report, lately presented to Parliament, the number of this Museum at South Kensington near 1911 was 316,673 on week-days "students' days," 125,191 on days to which an admission charge is made (on which the main building holds students' tickets), and (Sundays, giving a grand total of 1,000,000). The Department of Architecture has the plaster models by Alfred Stevens moved out of the Square in the Central Hall and the adjoining galleries where they are seen to advantage. The plaster models by Alfred Stevens connected with the Museum are exhibited for comparison with the models of cast-brass figures has been strengthened by the addition of several interesting pieces, such as a useful adjunct to the small original objects which represent this branch of the industry. A reproduction of the XVth-century Gothic iron screen of the Church has been added to the collection. Reproductions of ironwork. It is time to exhibit reproductions of all important medieval iron screens in this country.

One year Mr. J. H. Fitzhenry made notice to the already long list of objects he has so generously made to the Museum. These may be mentioned as interesting architectural specimens, including a plaster and pillar in carved limestone, French work of the first half of the XVth century. A fine example of French work of the middle of the XVth century, carved by a donor who wishes to be remembered. This is a life-size stone figure of the Virgin and Child in singularly good preservation, almost all the original colour being preserved. It is said to have been the work of the artist who carved the Petite Chapelle St. George near the Royal Abbeceourt. The type is one, in which the Child holds a lily in his left hand, and blesses with his right hand. An unfinished cartoon for a figure of the Virgin and Child, carved by Pierre Pavis de Chavannes, presented by the National Art Collection. This cartoon is painted in oils on canvas and represents a seated female figure distributing gifts to child-angels, on either side of her; the composition is intended to fill a semicircular lunette, 12 ft. 4 in. Until this gift was received, the Museum possessed no specimen of the work of this influence on modern decoration so great. An oval mirror in a carved frame, with a figure of the Virgin and Child, presented by Sir E. Stern. The mirror was made for Frederick Prince of Wales (1684-1748), whose name is on the building and decoration of houses and other English houses of the 17th and 18th centuries, and illustrates the characteristics of the style of that period.

During the year the Department of Architecture and Sculpture was fortunate in purchasing two admirable examples of the art, viz., a figure of the Virgin from Ecouen, carved in a soft stone, and a cluster of five pillars, Fontainebleau, with stone capitals and grey marble shafts. The statue is a style certain reliefs which were under the supervision of Pierre and Jean de la Roche, and probably of the same period. The cluster of five pillars have been found in the course of excavations outside the west door of the church of Grez-sur-Loing (Seine-et-Marne), probably dates from early in the 15th century. Several interesting acquisitions have been made for the collection of sculpture, among which should be mentioned a fine stone relief of the Virgin and Child, a contemporary reproduction of a Minoan relief ascribed to Mino de the only XVth-century Florentine of importance hitherto unrepresented in this Museum. A recent acquisition is that of a large sketch model, namely in plaster, of a group of figures, purchased from the estates of Mr. James Gamble and the late Thomas, two of Stevens's surviving works during 1911. The first collection

tion comprises a number of valuable studies for architectural and industrial work designed or carried out for the Wellington Monument in St. Paul's Cathedral, Dorchester House, and other undertakings. The chief interest of the second collection lies in the five splendid models of sculpture designed to form part of his proposed scheme for the decoration of the dome of St. Paul's.

In the Department of Woodwork purchases have mainly been made with a view to filling gaps in the collection of English furniture. Among the more important are the chair of the President of Lyons Inn, a former Inn of Chancery, and an English wooden bedstead of the time of Queen Anne. The chair, which is of mahogany, and is carved on the back with scroll and rococo ornament, is a fine example of the type of chair made by Chippendale and his contemporaries for civic ceremonies about the middle of the XVIIIth century. The bedstead has hangings of rose-coloured watered moreen, trimmed with green and yellow galon.

The following articles have been loaned to the Museum by the King, viz., eleven examples of Nepalese (Néwar) carving, in red birchwood, XIXth century, including model of the Hindu Temple of Krishna at Patan, Nepal; chimney-pieces from Khatmandu; two picture-frames from Khatmandu (containing coloured photographs of temples at Bhatgaon and of street architecture in Khatmandu); pair of vases from Khatmandu; miniature lattice, copied from a lattice-window in Khatmandu; miniature windows, copied from windows in Khatmandu.

QUESTIONS IN PARLIAMENT.

Erection of Government Buildings in Dublin.

On July 29 Mr. Brady asked, in the House of Commons, when it is proposed to resume and complete the construction of the new Government buildings in Upper Merrion-street, Dublin. Mr. Masterman, in reply, said that the commencement of actual building operations on the site is contingent on the vacating of certain of the houses thereon at present used as offices. It is expected that these offices will be vacated in January next, after which building operations will be proceeded with on the site. Tenders for the new buildings are being invited at once, and the declared contractor will be required to proceed with the preparation of the stonework, joinery, and steelwork as soon as the contract is signed.

Insurance Act and the Cement Trade.

In the House of Commons on July 29, Mr. John Ward asked the Secretary to the Treasury whether his attention had been drawn to a ballot now being taken by the Associated Portland Cement Combine of their workmen asking them to transfer from any approved society they may have voluntarily joined under the National Insurance Act to an approved society about to be established by this cement trust; whether it is the intention of the Insurance Commissioners to give their approval to a society made up of persons coerced to transfer from their own properly constituted societies, and what action, if any, does he propose to take to prevent intimidation of this kind? Mr. Masterman, in reply, said that he was informed that the firm in question had decided not to form an approved society for the purposes of the National Insurance Act. The remaining questions, therefore, did not arise.

Designs for Jam Sahib of Nawanagar's Palace.

Mr. George Greenwood, in the House of Commons on July 29, asked the Under-Secretary of State for India whether his attention had been called to a claim of the Compagnie, of 47, Graham-street, Sloane-square, S.W., against his Highness the Jam Sahib of Nawanagar, for 900l. in respect of work done and designs supplied to his order in connexion with his Highness's proposed summer palace; whether he is aware that correspondence has taken place between the early part of 1908 and the present time between his Highness's agents, private secretary, and solicitors on the one side, and the company and their solicitors on the other side, and that such correspondence discloses the fact that his Highness has repudiated the claim in question, and whether any steps have been taken by the Secretary of State in the case?

Mr. Montagu, in a written reply, stated that

the attention of the Secretary of State has been drawn to the correspondence referred to, the effect of which is as stated. His Highness the Jam Sahib has not asked the Secretary of State to advise him, and it has not hitherto been the practice of the India Office to intervene between ruling chiefs and their private creditors.

The Old Post Office Site.

Captain Jessel asked the Postmaster-General whether the old Post Office buildings at the corner of Newgate-street and St. Martin's-le-Grand are to be pulled down, if so, whether it is proposed to erect new buildings on the present building line, and whether the opportunities for future street improvements at this important corner have been considered. Mr. H. Samuel replied that the old Post Office, which is being pulled down, is not at the corner of Newgate-street, but is bounded by St. Martin's-le-Grand, Gresham-street and Foster-lane. New buildings are to be erected on the site. It would be for the Corporation of London to make any suggestion with regard to street improvements, and if they desire to do so he should be prepared to confer with them.

LUNATIC ASYLUM BUILDINGS.

In their sixty-sixth Report just presented to Parliament, the Commissioners in Lunacy state that the suggestions and instructions issued by the Board with reference to sites, general arrangement of buildings, construction of buildings, plans and particulars, and estimates of cost of asylums have recently been carefully revised. In them prominence has again been given to the fact that, while not desirous of in any way discouraging the evolution of new designs for buildings that may possibly tend to the recovery and more successful treatment of patients, the Commissioners will insist upon the strictest economy, consistent with suitability for purpose and good workmanship, being exercised both in construction and equipment. The Commissioners have also pointed out that elaboration of design for merely architectural effect will not be sanctioned, and that decorative stonework or other expensive material introduced for that purpose will prejudice the approval of the plans by the Home Secretary.

A large number of building schemes, varying much in magnitude and importance, have been under consideration during the past year. Of these eighty-six, representing a total estimated expenditure of 295,900l. 17s. 6d., were finally dealt with.

The arrangement, understood to be tentative in character for three years, whereby the Commissioners have had in their office the entire services of an experienced architect and some additional clerical help to assist them in dealing with plans, estimates, and contracts relating to building schemes, and with the highly technical and important questions related thereto, has proved most successful—the completeness of criticism, formerly impossible, having tended to promote greater suitability of design and construction, and to the advancement of public economy—and it is with satisfaction that the Commissioners are able to report that the Treasury has sanctioned its continuance on a permanent basis.

In the case of the London County Manor Asylum the Commissioners declined to recommend a scheme for the enlargement and alteration of the recreation hall, with a view to making it suitable for religious services as well as for entertainments, on the grounds that the Asylum ought to be provided with a separate building to be used exclusively for religious services, and that there ought to be no further extension of the present quasi-temporary building. The whole question of the provision of chapel accommodation at asylums where it is at present deficient is receiving careful consideration.

In several instances the approved additions to existing asylums consisted either in the provision of cottages for married attendants or an extension of the Asylum estate. Few things tend more to make male attendants contented and settled and to become efficient in their work than the knowledge that when they marry they will be able to obtain suitable houses in close proximity to the Asylum. Where, therefore, suitable cottages are not available, they ought to be provided by the Committee. As regards the extension of asylum estates, it is considered important, both in the interest of the patients and for economic administration, that, as far as

Messrs. Mabbett & Edge, auctioneers, 10, Grosvenor-square, W., will sell by auction on Saturday, August 17, at 11 o'clock, a freehold seaside building land on the Downs, Bexhill. An advertisement containing further particulars appears in this issue.

At their last meeting, the County Council approved a scheme for widening West High-street to be let on a building lease to A. C. Ebbutt, the lessee to consent to be passed by the Corporation, for not less than 1,000l. Plans have been submitted for Mr. P. Richardson, 30, Addison-street, for the erection of six houses in 1912.

The tender of Messrs. H. Elliott & Co. has been accepted at 256l. 7s. 6d. for the footway bridge over the River Rye.

Repairs are to be carried out on the carriageways in Greenwich-street, estimated cost of 133l.

The tender of Mr. H. Farrow has been accepted at 9,318l. 14s. 6d. for carrying out works in Brent-street, Green, and North End-road; as has also the tender of Messrs. C. W. Halls & Co. for the erection of a mortuary for the Council offices. Mr. Farrow, at 211l. 8s., has further been accepted for the erection of a shed at the depot. Sanction has been received from the Local Government Board to the effect of 2,562l. for improvement works in the Lawrence-street, Mill Hill, and plans have been passed:—(1) Streather, twenty-two houses, avenue, Golder's Green; Mr. J. D. Green, St. George's-road, Green; Mr. S. Johnson, three houses, Mr. Frank Secar, six shops, Brent; Messrs. Michell & Aldous, alterations of "Waies" public-house, the Burnt, J. King, three houses, the Park, &c.

At the last meeting of the Council, the Report of the Fire Committee was adopted. In this Committee recommended purchase of the station for the erection of a station office, residence, and separate residential quarters, at an estimated cost of 5,610l. proposed to carry out alterations to the station and South Haringay fire-stations, at an estimated cost of 170l. and 420l.

The tender of Messrs. Gabriel, Burtons has been accepted, at 57,000l. for the supply of 57,000 creosoted blocks for the paving of a portion of the roads. The tender for the carriage-ways of Brecknock and York, total estimated cost of 654l. The barrel sewer in Grafton-road is to be replaced by a new 9-in. stoneware pipe in its place, at an estimated cost of 1,150l. The electric lighting in Ball's Pond-road, St. Paul's, and New North-road, will have decided to repave with the margins of the roads mentioned. The tender of Messrs. E. C. E. for the improvement of the transverse sections of the roads, at a cost of 11,500l. For these works, the Committee have accepted the offer of Messrs. William & Co., Ltd., Hamilton House, E.C.

The tender of Messrs. Champlin, has been accepted, at 502l. for alterations at the North Kensington Library. The wood-paving at the entrance of Queen's Gate-place is to be extended for a distance of about 100 ft. at an estimated cost of 75l. At an estimated cost of 332l., the kerb and footway in a portion of Sydney-place is to be replaced. The asphalt paving in the Portobello-road is to be extended at an estimated cost of 191l.

The footways in portions of two streets are to be repaired at an estimated cost of 1,150l. The following plans have been submitted:—(1) Messrs. E. C. E. for the improvement of the transverse sections of the roads, at a cost of 11,500l. For these works, the Committee have accepted the offer of Messrs. William & Co., Ltd., Hamilton House, E.C.

The tender of Messrs. Champlin, has been accepted, at 502l. for alterations at the North Kensington Library. The wood-paving at the entrance of Queen's Gate-place is to be extended for a distance of about 100 ft. at an estimated cost of 75l. At an estimated cost of 332l., the kerb and footway in a portion of Sydney-place is to be replaced. The asphalt paving in the Portobello-road is to be extended at an estimated cost of 191l.

THE BUILDER.

have been passed for Mr. W. A. Goring for the erection of three houses, Fox-lane, Palmer's Green, and twelve houses, St. George's-road, Southgate; as have also plans submitted by Mr. A. Sykes for the erection of five shops and houses at the Market Green-lane, Palmer's Green.

Wandsworth.—The tender of Mr. T. Adams, at 2,208l., has been accepted by the Borough Council for flagging the footways in Grove-road, Balham, with Croft adamant artificial stone. The Borough Engineer has been instructed to carry out the work of constructing a sewer in a portion of Wimbledon Park-road, Southfield, at a cost of 386l. Plans have been passed for Mr. W. Pinney, Messrs. Holloway Brothers (London), Ltd., and Messrs. W. & E. Hunt, for the erection of an electric theatre in High-street, Wandsworth; eight houses in Magdalen and Ellerton roads, Springfield; and additions to Nos. 1 to 25, The Boulevard, Balham High-road, respectively.

Watford (Rural).—The District Council have received sanction from the Local Government Board to the borrowing of 1,900l. for street works at Aldenham. The sewer in Rastbury-road, Northwood, is to be extended at an approximate cost of 280l.

Watford (Urban).—Plans have been passed for the erection of a mortuary and additions to the boiler-house at the Watford Workhouse, for the Guardians. Mrs. Howell has lodged plans for the erection of a house and laundry in Sydney-road.

Wimbledon.—A portion of the footpath on the north side of Worple-road is to be paved with concrete slabs at a cost not to exceed 294l. Another portion is to be similarly paved at a cost of 310l. The following plans have been passed:—Messrs. Everitt & Sons, additions to the King of Denmark Inn, etc., The Ridgway; Mr. W. Rogers, alterations and additions to No. 10, Church-road; Mr. P. D. Clapham, additions to Southdown Laundry, Kingston-road; Messrs. Gripper & Stevenson, garage, Belvedere-avenue. Plans have been lodged by Mr. R. A. Hinds for the erection of three shops in Coombe-lane; also by Mr. R. J. Thomson for shops and houses in High-street.

Wood Green.—The Urban District Council have instructed their Surveyor to prepare plans, etc., and tenders are to be invited for culverting sections one and three of the Muswell Stream. Tenders are also to be invited and application is to be made to the Local Government Board for sanction to borrow 1,401l., the estimated cost for carrying out private street improvements in portions of Alexandra Park-road.

OBITUARY.

Mr. R. Clutton, F.S.I.

The death, on August 2, is announced of Mr. Robert Clutton, aged sixty-nine years, of No. 5, Great College-street, Westminster, and No. 5, Vicerage-gate, Kensington. Mr. Clutton, a son of the late Mr. John Clutton, principal founder and first President of the Surveyors' Institution, 1866, joined the Institution in that year, and was elected a Fellow six years afterwards. He and his elder brother, Robert George Clutton, F.S.I. (who died in March, 1907), were members of the firm of Messrs. Clutton, surveyors and agents to the Ecclesiastical Commissioners, the Commissioners of Woods and Forests, and many private owners of landed estates. His services were often employed in arbitration cases in respect of the compulsory acquisition of property.

FOREIGN AND COLONIAL.

Improvements in Lyons.

Progress (reports the British Consul. Mr. E. Vicars) continues to be made with the immense programme of public works on which the municipality of Lyons embarked some five years ago, and to meet the cost of which a loan of 1,400,000l. was raised at 3 per cent. interest. The new slaughter-houses and cattle market, though begun in 1909, are not expected to be completed for at least another two years; they are to cost 528,000l. Of the three new bridges included in the municipal programme one—the Pont de l'Homme de la Roche, over the Saône—was formally opened on March 31, 1912; the other bridge over the Saône, the Pont de la Feuillée, is in process of construction; but the remaining one—that of the Hôtel Dieu over the Rhône, which is to take the place of an existing suspension bridge—has not yet been begun, though a light temporary structure of wood capable of carrying vehicular traffic has been built, at a cost of 7,000l., to enable the present one to be abolished, so that

the beginning of this work (estimated to cost 72,000l.) will not be long delayed. A second bridge over the Rhône is also projected, to connect the right bank with the new slaughter-house quarter. This structure, to be called the Pont de l'Abattoir, will be of reinforced concrete throughout—the first of its kind in Lyons—and is estimated to cost 64,000l. It is intended to invite tenders for this work, but these municipal contracts, even when they are nominally open to the whole world, are but rarely given to any but French firms. The new ornatorium is being pushed on, and the extensive additions to the town water-works and supply source, estimated to cost over 80,000l., are being carried out. A new general hospital is to be built to take the place of the Hôtel Dieu, a venerable building on the right bank of the Rhône. For more than ten years the municipality has been engaged in building a great retaining wall of masonry, to render secure the rocky cliff side of the Saône, supporting the picturesque hanging gardens of the Chartreux. This has now been completed at a cost of 20,000l. The town engineers are engaged in evolving a complete drainage system for Lyons, the cost of which is vaguely spoken of as likely to be between 800,000l. and 1,200,000l.

A Growing City.

São Paulo, the capital of the State of the same name, in Brazil, continues its extraordinary march of progress. During the past year there were constructed over 4,000 new houses, all of which were occupied as soon as finished. So rapid is the increase in population that the demand for houses is greatly in excess of the supply, with the result that rents have reached fantastic figures. The population of the city of São Paulo at the present time is estimated at 380,000, and it is expected that within the next fifteen years it will reach 1,000,000. Value of land in the city has increased enormously. At the present time the value of sites in the business area ranges from 100l. upwards per square metre, and in the outlying districts, building plots sell for 7s. to 10s. per square metre. During 1911 a company was formed in London with a capital of 2,000,000l. for the purpose of acquiring and developing lands within the municipal area of the capital. Another company has lately been formed with a capital of 340,000l. for the purpose of constructing two large hotels upon the most modern lines, one in the city of São Paulo and one at Guarajá, the favourite seaside resort near Santos. Work in connexion with these hotels will be commenced forthwith. The magnificent opera house, constructed by the São Paulo municipality, was completed during the past year. It has been decided to pull down the old cathedral and to construct upon the site thereof a new edifice, which for size and magnificence will rank amongst the finest in the world. It is to cost 400,000l., the money being found principally by private subscription, aided by a substantial donation from the State. The municipality have commenced operations in connexion with an immense scheme of city improvements, as suggested by M. Bouvard, architect for the city of Paris, who was invited to draw up plans. In accordance with this scheme, the existing viaduct which spans the valley between the old city and the modern extensions will be replaced by a new and more solid structure. Three additional viaducts will be built, the principal thoroughfares will be asphalted, several of the existing streets will be constructed, so as to traverse the city in all directions. Furthermore, the valley to be spanned by the viaducts will be drained and levelled and converted into a public garden. The cost of the projected scheme is estimated at 4,000,000l., towards which amount the State has already contributed 700,000l. It speaks well (remarks the British Consul in reporting upon the project) for the credit of the municipality of the capital that proposals upon very favourable terms have been received from several financial houses in Europe for the large amount required in connexion with the scheme.

Material and Equipment for Warehouses, Canada.

H.M. Trade Commissioner for Canada reports that, according to the *Montreal Gazette* of July 3, a company has been formed, with a total authorised capital of 6,500,000 dollars (about 1,335,000l.), for the establishment of a chain of terminal warehouses from Montreal to the Pacific Coast, in connexion with the Grand Trunk and Grand Trunk Pacific railway systems. The first chain of warehouses will include Montreal, Toronto, Fort William, Winnipeg, Calgary, Edmonton, Vancouver, and Prince Rupert, and as soon as this chain is established steps will be taken to extend it by the construction of additional warehouses

at other places where they are needed. It is stated that contracts have been entered into by which the Grand Trunk and Grand Trunk Pacific railways agree to entrust the new company with all their warehousing business for a period of thirty years. The names of the companies, etc., to which the foregoing notices relate may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Ferro-Concrete Sheds, Austria-Hungary.

The *Zentral-Anzeiger für das öffentliche Lieferungswesen* (Vienna) of July 21 announces that the municipal authorities of Vienna have approved the plans for the erection of a tramway depot at a cost of 1,750,000 kronen (about 75,000*l.*). This station will comprise a ferro-concrete shed capable of accommodating 296 cars, and, it is claimed, will be the largest tramway depot in the world.

Buildings, etc., Hungary.

The same issue of the *Zentral-Anzeiger* states that the municipal authorities of Debreczen (Hungary) are at present negotiating for the issue of a loan of 100,000,000 kronen, which will be applied in part as follows:—Erection of university buildings, 6,000,000 kronen; erection of a hospital, 3,000,000 kronen; rebuilding or renovating the municipal theatre, 2,000,000 kronen; building new town hall, 4,000,000 kronen; street paving, 5,000,000 kronen; central cemetery and crematorium, 1,700,000 kronen; erection of a market hall, 2,600,000 kronen; building of barracks, 6,000,000 kronen; erection of other new buildings, 3,000,000 kronen. (24 kronen = 1*l.*)

Customs Warehouse, Canada.

H.M. Trade Commissioner for Canada reports that sealed tenders for the construction of a Customs Examining Warehouse at Montreal will be received, up to 4 p.m. on August 8,* by the Secretary, Department of Public Works, Ottawa. A copy of the specification and form of tender may be seen by British contractors at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C. H.M. Trade Commissioner states that, although it does not appear probable that any firm in the United Kingdom will be in a position to tender for the work as a whole, there may be openings for the supply of materials, such as cast-iron pipes, steel structural work, etc.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless they have been acknowledged by them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiered Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 6 p.m. on Wednesday. (N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.)

* Denotes accepted. † Denotes provisionally accepted.

their forms scarcely veiled by the draperies which fall down in delicate lines, like falling snow to their feet; how nobly they stand whilst the centuries pass slowly by as a lingering procession—lingering lest they lose such beauty! Mutilation has not stolen their dower of grace, nor the fraying finger of time. They are still surprising as they stand, almost Sphinx-like, so exquisitely poised that any movement would rob them of something of that completeness, that perfection, which was the aim of Attic work.

There is a fragment of a small bas-relief of a charioteer, also in the British Museum. The figure leans forward to keep his balance, whilst his long robe trails out behind, blown from his figure by the wind of the chariot's headlong progress. It is a great moment petrified, the joy of rapid movement, almost of flight, expressed in marble. There is nothing else like it, if it be not the relief of "mænads dancing," in which the fall of drapery is similar, and conveys another idea of motion. Again, the "winged Victory" of the Louvre seems poised ready for flight into the Empyrean.

These blossoms and numberless others may be gathered from Attic soil; for it is as rich as any fabled garden of the Hesperides, different only in this—there is no let or hindrance to the ardent seeker.

Greece and Italy are inseparably linked together, and it has been said that the short age of Pericles and the XVth and XVIth centuries in Italy were the most fruitful for art in the history of the world. Both were periods of transition or awakening, if you will, from the petrified civilisation of Egypt, from the bondage of mediæval ideas. What Mr. L. March Phillips said of the first equally applies to both. He writes:—"It is, in all truth, a moment of birth, comparable almost to the moment, as the great Florentine has conceived it, when the first of our race felt the touch of the divine finger and opened heavy eyes in which the light of intelligence and recognition for the first time was kindled." So we shall find also many delightful flowers of art in Italy. The painting of Botticelli, for example, with the fair Simonetta as central figure, as the sea-born goddess, as the Virgin, as Judith—*La bella Simonetta*, with the

strange and wistful smile, who died in early youth and was borne to her grave with her beautiful face exposed.

For example, the delicate sepulchral sculpture of Mino da Fiesole; the modelled *tondos* of Luca della Robbia, whose light and colour seem to bring down the sky into the dark recesses of Florentine streets; Cronaca's church of San Salvatore del Monte outside Florence, which Michelangelo, for its quietness and grace and unadorned beauty, was wont to call "his fair country-maiden."

These be flowers of high culture, but there are others of a wilder growth, yet beautiful as the dog-rose of an English hedge-row. Some of these, and not the least interesting, are to be found in the Renaissance monuments in our own churches. They do not possess, it is true, the pure artistry of similar Italian work, but they have a quiet and reposeful quality all their own. Nothing could well be more peaceful than these seemly gems of architecture, with their carving and ornaments finely coloured and gilded, with their effigies of the long since dead cut "in monumental alabaster."

Architecture has for its chief use the housing of the living in their varied and manifold activities, it has also always been of service to religion and to the dead. It is this last aspect that at present engages us. Certainly no more fragrant flowers of art have ever blossomed than these dedicated to the memory of our ancestors. Egyptian foolishness conceived a pyramid, and the Greeks, with their bright humanity, expressed the sadness of parting, of "farewell." The Renaissance, with all its pseudo-Paganism, could not, if it would, be rid of Christianity, and its monuments speak of peace and rest. In their presence death is no dread contingency, it seems well to lie stretched out through the centuries free of the turmoil we call life.

In all European countries the Renaissance produced these monuments, many of singular beauty, but all possessed of a fine and notable character. In Italy, at least, the classical stories were carved side by side with those of Christianity. Browning, in "The Bishop Orders His Tomb," shows how Italian prelates viewed art—how sacred and profane things had to be blended together by the unifying power of art. Just as Botticelli depicted the foam-born goddess with draperies and emblems of a Gothic origin, just as Michelangelo in the Doni Madonna introduces "the unveiled human form, the sleepy-looking fauns of a Dionysiac revel, into the presence of the Madonna," so the sculptor endeavoured to reconcile Paganism with Christianity, to carve, indeed, as Browning says:—

"The bas-relief in bronze ye promised me,
Those Pans and Nymphs ye wot of, and I
perchance
Some tripod, thyrsus, with a vase or so,
The Saviour at his sermon on the mount,
St. Praxed in a glory, and one Pan
Ready to twich the Nymph's last garment off,
And Moses with the tables."

And we find in painting, on two opposite walls of the Vatican, Raphael's "Disputa" (which has been defined as the Glorification of the Christian Faith) and "The School of Athens." Whatever antagonism there may be between these and similar, or perhaps

better, dissimilar, themes, the effect of the work of Mino and Luca della Robbia and others of the Italian artists is one of infinite peace and rest. As Walter Pater writes in his gracious way:—"Their noblest works are the careful sepulchral portraits of particular persons—the monument of Conte Ugo in the Badia of Florence, of the youthful Medea Colleoni, with the wonderful, long throat, in the chapel on the cool north side of the Church of Santa Maria Maggiore at Bergamo—monuments such as abound in the churches of Rome, inexhaustible in suggestions of repose, of a subdued Sabbatic joy, a kind of sacred grace and refinement." English sepulchral monuments never reached the pitch of the Italian ones, never attained to the calm perfection of the work of Mino, yet they were beautiful in their own way and full of a spirit of peace and contentment. Before the time of Nicholas Stone, effigies of knights and ladies, prelates and laymen had been executed by thousands of unknown mediæval craftsmen in stiff but not unbeautiful attitudes of rest. Until at last the figures took on the semblance of life or the stately repose of the dead. There they lie through the still centuries listening to "the blessed mutter of the mass."

In a way Nicholas Stone sums up the period when the first flush of the Renaissance in architecture lighted up England. He was born towards the end of the XVIth century, and his working life roughly coincided with the first half of the XVIIth century. It is probable that if he had studied in Italy his work would have developed along different lines. He did not, however, visit that country, and his work shows a strong Flemish tendency, the legacy of some early years spent in Amsterdam. Early in the XVIIth century he took a workshop in Long Acre, and from that time until his death he worked unweariedly at sepulchral monuments, which vary from elaborate pieces of architecture, like the Tanfield tomb at Burford, to simple mural tablets like that to "Mr. Law" at the Charterhouse. Unfettered as he was by a knowledge of the exquisite beauty and finish of Italian tombs, and which we may assume was beyond his scope, he was also free of all its conflicting Paganism and Christianity. We took so much from the Low Countries in the early years of the Renaissance that we have come to consider certain grotesque elements as typically English. They were, however, sympathetic to our tradition of virility. Something too of that morbid contemplation of death in the midst of life which renders some aspects of mediævalism so repellent still remained in art and sounds a very unharmonious note in some of Stone's lovely compositions. Even as late as Roubilac this *macabre* element was present, witness his fine work in Westminster Abbey where a skeleton leans out and stretches upwards from the door of the tomb to the living figure standing above. Contrast this with the great design by Bartholomé in Père Lachaise, which possesses a tragic note almost Greek in its poignancy and beauty. The poor drooping figures pass through a square opening to the unknown. It suggests "Farewell," that saddest of all tombstone inscriptions,

It would not be reasonable to comparisons between, say, Fiesole and Nicholas Stone, gulf separates them. In the garden there will be found rare culture, blooms of so exquisite fragrance and form that it is possible for nature to compass again, and in the more open space free of God's wind and rain and flowers of more robust complexity perfect in form, but with so much beauty of the wind-blown cloud may stand for Mino's works, our Stone's.

And Nicholas Stone, in the sepulchral sculpture, must stand in this country. His figures of contemporary costume, armoured softer garments of courtesy, and great part of exceeding beauty, certain nobility in the cast of a dignity in their mien, is characteristic of his standing figures, as in the bearers of the Sutton monument in Charterhouse. But his greater are the effigies lying stretched out, are all touched with one known quality of gentleness. How he disposes the mort clothes, how he makes of the pillows and all the usually dedicated to woe! In the classical figure he was not so sure, a certain stiffness is characteristic of the pose, although the drapery skilfully arranged. His imitation of Michelangelo in the tombs of Sir Francis and Francis Holles at Westminster, however fine they may be, are far from the grandeur and fundity of the great Florentine in the field Church, in Suffolk, possibly an example of his work that in no way is unsurpassed. In a niche a little way above the square kneeling position, is the figure of a woman lies smiling, clasping a child in her arms. The whole effect is so beautiful, the figures so elegantly carved, that one is held as if by a strange charm. There is no discomfort, no charnel house to the moral, no horrid gaping skull to look into darkness. They lived so long they loved, gleamed for a little like the sunlit foam upon the waves and passed away. And now in the country church they lie together, and wife and child in attitude for ever. All this sculptor possesses something of the effect of this tomb. Many are much more elaborate, more interesting, but naturally, for Stone knew upon how to set his figures in their settings. And what is possible in monumental work, he has put out designs in the colours of marbles. His carved and armorial bearings are another in the interest his work inspires are carved with a fine sense of decorative importance and display equal skill.

With beginnings like these—flowers of art—is it not astonishing that this branch of sculpture should be out or that it should have been relegated to the Euston Road? There are fine sculptors in plenty, but they somehow but rarely touches the

have the execrable monument with his sentimental and his appalling vulgarity. Such, if it does not hold an ent, holds nothing but glaring slabs and ridiculous brass lettering which no one could at effort, even if he had a use before it. Surely it is time survival in taste should touch and lift them out of the so which they are fallen. primary in Italy to write upon the entrance to the Campo words, "Scupla del Migliori Art at least should endeavour not so, to make the cypress osom out again in delicate flowers of art, to make the old once more those lovely be dead, to make, indeed, all re she shows her gracious a school for great thoughts."

ST. PAUL'S BRIDGE, THE POST OFFICE, AND THE TRAFFIC PROBLEM.

last week's issue we published a letter from Mr. Arthur Crow dealing with the important issues which demand settlement in view of the fact proposed to start building on the old Post Office site next few weeks. We now order to illustrate this subject, portion of the City of London, and on this a new road which Mr. Crow suggests to relieve the traffic neighbourhood of the Bank. A new road would form in continuance of Newgate-street, cutting through Aldermanbury, and relieving traffic from Liverpool-street necessity of traversing the heart of London in taking direction, and correspondingly

affording relief to the crowded area round the Bank and the Royal Exchange.

The relation of this question to the approaches to St. Paul's Bridge is shown in a second plan, which we illustrate herewith, in which Mr. Crow has indicated how the space immediately east of St. Paul's Cathedral might be dealt with.

As the first of these proposals, that of a new road, can hardly be said to be yet within the range of practical politics, we should be inclined to lay down as an axiom that any treatment of the approaches to St. Paul's Bridge should be capable of being considered as an independent problem, which, to be sound, must be defensible both from the point of view of the architectural amenities of the situation and also from a practical point of view. If such a scheme fits in and forms a convenient section of a greater improvement, viz., a road diverting traffic from a congested centre, such would form an additional merit, but in the first case we should deal with the smaller problem separately.

From a traffic standpoint there seems to us to be much to be said for the provision of a greater amount of space at the junction of such thoroughfares as St. Paul's-churchyard, Cheapside, Newgate-street, and St. Martin's-le-Grand, and, although the scheme destroys a valuable corner block at the junction of St. Martin's-le-Grand and Cheapside, we consider the loss is more than counterbalanced by the gain, while it may be pointed out it increases the value of the frontage to Foster-lane, which adjoins the Church of St. Vedast, and which would, if this scheme were carried out, front on to the new open space formed. Architecturally the scheme would open up to view the Church and steeple of St. Vedast, one of the most charming of Wren's smaller designs. The destruction of the narrow wedge-shaped block between St. Paul's-churchyard and Old Change seems abundantly justified commercially by the greater value which would be given to the buildings facing

on to the widened road formed, while architecturally no worse or more unharmonious group can be imagined than the great mass of the apse of St. Paul's and the end view of the narrow wedge of commercial buildings which would be otherwise left. We now learn that the London County Council have considered and agreed to the abolition of this block, so that Mr. Crow's suggestion in this respect is embodied in the agreed scheme.

The third element to be considered is that if the scheme were carried out the end of the vista which would face the approach from the bridge would be an elevation of the new Post Office buildings rather than a group of mean-looking commercial buildings fronting on to an irregular or broken curve. The exact alignment of this new frontage would naturally largely depend on the probability or otherwise that some such new thoroughfare as Mr. Crow has suggested may in the future be carried out; but we consider that as to the general desirability and feasibility of carrying out the scheme there can hardly be an adverse opinion. Nor can there be any doubt as to the desirability of bringing about a conference for joint consideration between the Corporation and Government authorities, and that these bodies should ask their expert advisers to consider the questions raised before the new Post Office building is started would seem to be but common sense.

It may be urged that if these buildings are set forward in line with the edge of St. Vedast (practically the boundary of the site), even if the shops on the corner are done away with and a suitable end façade designed, this would, though meeting present wants, doom St. Vedast to destruction if a new road eastward at this point has subsequently to be made. So that we feel the frontage line proposed to be a reasonable one looked at from all points of view. If the scheme as here shown should be too

A Proposed New Road in the City, shown by Dotted Lines. (From the Ordnance Survey Map.)

NOTES.

St. Paul's Bridge, the Post Office, and the Traffic Problem: Proposed New Road.

costly to be at present contemplated in its entirety, it would be quite possible to leave the shops at the corner for the present, designing the end of the new Post Office buildings so that it may be subsequently opened up to view.

It is unfortunate in this, as in other cases, that it should be necessary to ask for changes in schemes which have no doubt been carefully and thoroughly considered, like the plans for Sir Henry Tanner's new buildings at St. Martin's-le-Grand. This is, however, due to no fault of the designer. All that architects have been asked to do for years is to fill in a given site in the best way possible. That has been the extent and limit of their duties. It is now being more widely recognised every day that we must act collectively as a profession in order to do our best to ensure that areas and public places are dealt with collectively on broad and well-considered lines, and that public authorities should take advice on these subjects and form schemes which can be carried out with benefit to the public. But in the transition stage, which we have reached, it obviously must be necessary in many cases to act later when we should have acted sooner, frequently thereby causing no little inconvenience to individuals.

It is certain that until the principles which should govern the lay-out of cities and groups of buildings have received more attention, and our experience has in a measure become codified, it will frequently be necessary to consider and reject schemes which enthusiasts may bring forward without due consideration of practical requirements

or of cost. But the suggestions we illustrate to-day are not in this category; we think they would commend themselves to good business men who had mastered the facts.

With regard to the larger question of an additional road for traffic diversion, we would say that there are very great reasons for considering that such a road must in the near future be made, and on the face of it Mr. Crow's suggestions seem to us to be reasonable. We may add that a rough estimate of the cost of such road as far as freehold interests are concerned places its cost at 3,000,000*l.*, reduced to a net cost of about 1,500,000*l.*, by the resale of portions of the sites acquired and the increment which would be added to the value of property facing on such a new thoroughfare.

Mr. Crow would further propose to widen Newgate-street along its southern side so as to render it a reasonable continuation of Holborn-viaduct instead of a bottle neck between it and Cheap-side. He points out that such an improvement would be made without disturbing the frontages to the Central Criminal Courts and the new Post Office frontage to Newgate-street. This, however, is a question which has not to be dealt with immediately, but it may well be considered in its relation to the changes which have to be made adjoining St. Paul's Cathedral.

THE MANSION HOUSE.

Some necessary sanitary repairs and improvements are about to be effected in the Mansion House at a computed outlay of about 700*l.* It is further proposed to expend 1,400*l.* upon the construction in duplicate of an artesian well.

The Monumental Mason. OUR leader touches upon

of widespread one that is suffering from the well-directed thought being upon it. All through the age of the artist has been bestowed memorials of the dead, mighty alike. The greatest artists that the simplest monument of them meant an opportunity of their best, to enrich the treasury of the world with another art." With our cruder lighter rougher materials, our own not vied out-of-doors with monuments proper to the memorials have been set up in countless under a brilliant sky, notably in and Italy. But we had, in our traditional types of monuments headstone of appropriate beautiful lettering, from old England to the other, down to the end of the XIXth century, many a hallowed acre reared may we ask, "Is it not astonishing this branch of art should have been a long-suffering people, we are the last, at the mercy of the mason, who, all unconscious of the meaning of the word "monument" piles upon us heaps of vulgar form of dishonoured marble and granite. To the architect, the mason or the trained craftsman no doubt has been given the opportunity of something, and he has often on occasion, but for various reasons people at large are at the mercy of onslaughts of the monuments who pursues "the bereaved" execrable designs at a time when they are least able to make protest, they knew how to make it. Some ago we stated, "It is evident that scarcely any article of everyday use has been neglected by the designer," and we believe that the happy outcomes of the interest and appreciation of the arts and the arts which is one of the encouraging outlooks in England. But monuments and headstones are articles of everyday use. They are more than that: they are for all time to be handled with greater respect and care for that, if for no other reason, for one memorial that does not exist there are thousands set up every day inspired from no better source than an illustrated catalogue, prepared by "designers" who cannot set eyes upon even our own examples of the craft, let alone our neighbours across the Channel. They have travelled, however, than the nearest XVIIIth-century yard, and come away unmoved, gives further proof, if any was needed, that the lessons to be learned have not been heeded. There is a certain elevation in the standard of taste" without doubt, but it must call for improvement in other matters, and they will call the will be answered by the trained artists who are not only anxious to answer the call.

We publish in this issue the first of a series of articles by Mr. Martin, A.R.I.B.A., formerly Lecturer to the Universities of Leeds. Mr. Briggs has been subject of Baroque architecture many years, and some of his work was published in 1910 in his "The Heel of Italy." He will give to our readers his observations on this fascinating and condemned phase of design. Baroque has been gained first in the country of Europe, and we feel sure, will be found in the dictionaries, "rough, grotesque, in bad taste," definitions as applied to architecture are often entirely misapplied. Much more finely-conceived architecture comes under the name of Baroque than is acknowledged in England to-day. It will be illustrated by photographs and sketches, and the style in the countries of Europe will be

The old cottages at Guildford have been saved, as announced in the last week, but another street scheme still threatens to deface the charming old-world thoroughfare, Lyne Regis, and the fossil shop at its corner, with other interesting buildings. It forms another "neck of a bottle" explained by us in former issues in this case also there are schemes which could be preserved and which would preserve the most characteristic features of the ancient borough. Unfortunately the Corporation have somewhat tied their hands by entering into contracts for the purchase of buildings, but this might yet be matters, as the sanitary commission these old houses could be seen. The leases do not terminate in a few months it appears that judgement might yet be come in this very small section of the street which many of the people are anxious to see retained.

This is a busy week for those members of the Architectural Association who are availing themselves of the advantages of an organised corner of England rich in architectural interest. With Shrewsbury, the surrounding country explored, and already Much with its delightful Prior's bright Hussey with its manor Moreton Corbet with its castle have been visited. The very nature of our visits of beautiful historic associations. Owing to our columns we are to defer our account of the till next week, when we hope, to reproduce many excellent made on the spot by Mr. Sutton who has undertaken the pleasant, possibly onerous task this year.

THE ROYAL ARCHÆOLOGICAL INSTITUTE AT NORTHAMPTON.

(Continued from page 168.)

TUESDAY, July 30, began with an excursion to Fotheringay, where Mr. W. H. St. John Hope first described the church. It had, he pointed out, been an ordinary parish church from before the Domesday Survey, but was made collegiate in 1411 by Edward Duke of York, who built a splendid choir in place of the old chancel for the dean, precentor, and eleven other fellows, the eight clerks, and the thirteen choristers of the new foundation. The present nave and its aisles with the north porch, the western steeple, and its eight-sided lantern, and a destroyed south porch, were built by William Horwode, of Fotheringay, precursor, in accordance with a contract entered into between him and two commissioners acting on behalf of Richard of York, dated September 24, 1434. By this contract Horwode undertook "to make up a new body of a kirk joining to the Quire of the College of Fotheringay, of the same height and breadth that the said Quire is of; and in length xxiiij fete from the said Quire downward within the walles." In the aisles were to be windows agreeing or "according in all Poynts unto the wyndows of the said Quire, sawi (that) they shall no bowtels haf at all." The contract specifies also the making of west windows to the aisles and nave, and the embattling of their walls, and of "six mighty Botrasses of freestone clen hewyn"; also of a clearstory "groundid upon mighty Pillars with four responents." The pillars were to carry "five arches abot the steupill and abot every Arche a wyndow . . .

of four lyghts according in all points to the wyndows of the clearstory of the said Quire." For the support of the roof there were to be built over the aisles "six mighty Arches butting on either side to the clearestory," and two other mighty arches "butting on either side to the said steupill." The steeple was to be built within the church "upon three strong and mighty arches [?] and vawthid with stoon," and to be square below, but with its upper part "chaungid and turnyd in vijj panes" with "clearestoryl wyndows . . . eche wyndow of three lyghts." All the carriage and "stufte, that ys to say, stone, lyme, sonde, ropes, boltes, ladders, tymbre, scaffolds, gynnes, and all manere of stufte that length to the said werke" were to be found by the Duke of York, who was also to pay William Horwode 300*l.* in all for carrying out his contract. Various discrepancies between the contract (which referred only to the masonry work) and the building, Mr. Hope thought might partly be due to the corrupt text, which was known only from the version printed by Dugdale, and one important section was both defective and apparently misplaced. The choir was unroofed after the suppression of the college and eventually cleared away, with the exception of the arches (now walled up) at its western end between it and Horwode's new body. That into the choir has over it the mark of the roof of the old nave, and above, a window that looked westward from the choir over it. The nave,

aisles, and steeple escaped destruction through forming the parish church. The nave is four bays long, with a narrow easternmost bay filled on either side with "two perpeyn walle . . . of freestone, clen wrought, that is to say, on on either side of the myddle Quere dore; and in either wall three lyghts and lavatories in either side of the wall, which shall serve for four autors, that is to say, on on either side of the middel dore of the said Quere, and on on either side of the said isles." Against the walls now stand two interesting monuments, set over the bones and gravestones of Edward Duke of York and his son Richard, the builders of the choir and nave, by Queen Elizabeth, who removed their remains out of the ruined choir. The aisles are seven bays long, and overlap the steeple, which has on the corners of the square belfry octagonal turrets carrying crested helms of the Duke of York, and on the top of the lantern a great copper vane formed of his badge, the falcon and fetterlock. The church contains a good font of the date of the nave and a beautiful contemporary pulpit (with a Jacobean canopy over the original one) with the arms, etc., of King Edward IV., and has a good series of open wooden roofs. The college cloister and buildings stood to the south of the destroyed choir, and have likewise utterly perished.

From the church the party walked to the Castle, which Mr. Hope described as a good example of the mount-and-bailey castles planted all over the county by the Normans; in this case to control the passage of the Nene. Its defences were still of timber in 1216, but by 1341 the great tower had been built in stone and cement, and the Castle also contained two chapels, a great hall, two lodgings, a kitchen and an oven, and a gatehouse with chamber over, in front of which was a drawbridge. Edmund of Langley is said to have rebuilt the great tower in form of a fetterlock, but Mr. Hope said he was not aware of the fetterlock being one of his badges. Leland ascribes the "refreshing" of certain "very fair lodgings" in the Castle to "Catarine of Spain," and these probably formed the apartments of Mary Queen of Scots for the few months previous to her beheading in the great hall on February 1, 1586-7. The whole of the castle buildings have gradually disappeared, and the only monument of them is a fallen block of rubble from the great tower. Mr. Hope spoke strongly against the proposal to enclose this with an elaborate railing, for which quite a large sum had already been subscribed by well-meaning but foolish persons, and suggested that the money could be spent with far greater advantage in excavating the site of the great hall in which Queen Mary died, and other of the castle buildings.

Tansor Church was next visited and described by Mr. Hamilton Thompson as an interesting example of development of plan from an aisleless chancel and nave to a building with aisles and a western tower. In the chancel are seven stalls with curved misericords, believed to have come from the destroyed choir of Fotheringay College, and with much probability, since they exhibit the falcons and fetterlocks of the house of York.

The journey was then resumed to Oundle for luncheon, and afterwards to Warrington, where Mr. Thompson called attention to the many features of interest in the parish church. It consists of a chancel, nave with aisles and clearstory and vaulted north and south porches, and a western tower and spire, all of excellent work of the middle of the XIIIth century, to which date belongs also the singular separtite vaulted ceiling of wood over the nave. Part of the XVth-century rood screen remains, together with a wooden pulpit of the same date, with paintings of Our Lord and the four doctors, which have been ignorantly "restored." The east end of the north aisle is shut off by a curious enterclose of Renaissance woodwork.

Polebrook Church was the next objective, and was shown by Mr. Thompson to have been cruciform originally, with a tower over the crossing, and perhaps aisles to the nave. Early in the XIIIth century the tower was replaced by a new one with spire at the south-west corner of the church, since there was no room west of the nave, and the remainder of the building, with the exception of the north arcade and chancel arch, was also reconstructed, and north and south porches added. The arcaded walls of the enlarged north transept are noteworthy; also the early XIIth-century font, the rood screen, and the Jacobean pulpit with its hour-glass and stand. A long

Polebrook Church.

discussion was raised by Sir Henry Howarth, who questioned the pre-existence, both here and in other churches visited during the meeting, of towers over a crossing which have now disappeared. Mr. Thompson and others quoted numerous examples in favour of such towers and the proofs of their existence, but the President remained unconvinced.

After tea at Oundle the fine church of that town was visited. This, until late in the XIVth century, undoubtedly had a tower over the crossing, as Mr. Thompson pointed out, but in the XIIIth-century chancel, aisles, and transepts were all enlarged, and subsequently the tower was replaced by the present beautiful XIVth-century steeple, with its crocketed spire at the west end. Late in the XVth century the vaulted south porch, with its upper chamber, was built, and later still the large two-storied vestry on the north of the presbytery. The rood screen has been cut down, but the piers towards the chancel aisles remain, as well as the fine XVth-century pulpit and a gospel eagle lectern of latten. Beneath the south transept is a large bone-hole.

In the evening the annual general meeting of the Institute, for members only, was held, and subsequently Mr. C. A. Markham read a paper on the Ancient Roads and Bridges in Northamptonshire.

Wednesday, the 31st, the last day of the meeting, was likewise the wettest. Brixworth Church was first visited, under the guidance of Mr. Thompson, who cited reasons for its ascription to so early a date as c. 680, and pointed out the evidence for the triple arch that originally divided the nave and presbytery. The church seems to have been burnt by the Danes in the IXth century, and was afterwards patched up for use again by pulling down the aisles and walling up the arches, and carrying up the western porch as a tower, which was subsequently raised and a circular vase added west of it. The polygonal apse at the east end appears, like Wing, to have had a vaulted ambulatory about it, but there are no definite signs of a crypt or *confessio*. The lofty clearstory, with its large window openings, is noteworthy, and there are some interesting remains of the XVth-century rood screen, but not in place. The south chapel and the spire date from the XIVth century.

The journey was then continued to Holdenby House, which Mr. Gotch described as "only a memory" of the largest Elizabethan mansion that had been built in England. It was erected about 1580 by Sir Christopher Hatton from the designs of John Thorpe, and consisted originally of two huge courts divided by the great hall and entered from a great courtyard, with gatehouse and flanking arches, as at Kirby. About 1608 the house passed into the possession of the Crown, and eventually became one of the places of detention for King Charles I. After his execution it was sold, and shortly afterwards hurried into decay. All that is now left of the former glory of the place is a portion of the kitchen wing, which has been converted into a house, the two arches of the courtyard, and some traces of the terraced garden.

The parish church, which stands just to the south of the house, is noteworthy for the fine Renaissance screen, which came from the chapel of the destroyed mansion, and is shown on Thorpe's plan.

After luncheon at Northampton a visit was paid to Earl's Barton Church, with its remarkable Saxon tower. The chief peculiarities of this were indicated by Mr. Thompson, who also called attention to the Norman arcading on the chancel walls and the re-use of parts of it to

form later sedilia. Mr. Hope also added some remarks about the Castle mount hard by, and in reference to the low side windows quoted entries relating to the making of one in the royal chapel in Windsor Castle, on an upper floor, early in the XIIIth century, and of another in the great hall of the Castle (now destroyed) when it was fitted up as a temporary chapel for the dean and chapter in the reign of Richard II.

The journey was then continued to Castle Ashby, where the great mansion of the Comptons, begun probably between 1583 and 1589 and finished in 1624, was described by Mr. Gotch. The ranges of chambers are disposed about a courtyard, but have internally undergone much renovation. Externally the house is remarkable for the Latin texts forming the balustrades of the parapets and for its fine gardens and lay-out.

The day's proceedings closed with a visit to Cogenhoe Church, which was described by the Rev. R. M. Serjeantson, and then the Northampton meeting came to an end.

The meeting, except for the showery weather, was in every way a success, about one hundred tickets having been disposed of, and all credit is due to the Honorary Secretaries of the meeting, Mr. E. L. Guilford and Mr. G. D. Hardinge-Tyler, for the way in which they carried out the arrangements of a very full programme.

THE ROYAL SANITARY INSTITUTE: CONGRESS AT YORK.

(Continued from last week, page 172.)

Ventilation and Warming of Churches.

IN the absence of Mr. J. Osborne Smith, F.R.I.N.S.A., his paper on the above subject was read by Mr. Saxon Snell. Having dealt with the present prevailing unhealthy state of things in churches, he said the requirements necessary to make the interior of churches healthy for use and occupation might be briefly stated thus:—(1) Ample means of cross-ventilation from openings in opposite sides of the building below or near the breathing line, in order to get rid of foul air at the very spot where it is generated. Cross-ventilation is also desirable high up near the flat ceilings, or in the sloping roof spaces, the openings being arranged to check or divert downward currents. (2) The inlets for fresh air to be as short as possible, capable of being readily cleaned, well distributed, and allowing at least 1 ft. super. of clear opening to about ten people. (3) Adequate means for warming incoming air, so that it may be not only warm, but also pure and fresh as possible at the breathing line during services.

Warming and drying air is a source of comfort, especially in a damp climate, but the drying can be so easily overdone as to be inconvenient. High temperatures should be avoided, and provision should be made for supplying additional vapour to the internal air when required. (4) Warmth just below open roofs, clearstories, and tall windows to prevent down-draughts. (5) Jointless solid floors, which can be readily kept clean. (6) Seats and fittings which do not obstruct the passage of light and air, or hinder the cleaning of floors. (7) Means for preventing the deposit and movement of dust. In cold weather, warmth, genial, all-pervading warmth, is desirable inside churches during occupation; the cold, bracing, breezy air, which is so enjoyable when one is moving

about, is not welcome inside, where people are sitting. Provision, therefore, made for:—(1) Warming incoming services, as well as the inside occupation. (2) Preventing the cold wind currents from windows, hopper lights to direct currents up from entrances by double doors, wards, and closed by checkspring, placing radiators or stoves near the (3) Preventing down-draughts by water pipes in roof spaces and by story and other windows. (4) Warming apparatus, well distributed, excessive temperatures either in warm-air flues.

The author laid down the following of warming:—(1) Large close inlets for fresh air are very useful. Underground stoves, the heat, through grating at floor level, but the air is often too dry and dusty. (3) Warm-air apparatus, by which air is admitted either from the outside to a furnace-room or large pipes, and discharged into the through vertical or horizontal grates, is usually an efficient arrangement. Warming air is liable to be constantly passing through flues and over pipes, cleaned only at rare intervals, pressure hot-water apparatus, with having fresh-air inlets. This is generally satisfactory when accessible for cleaning, and radiators in suitable positions. (5) Low-pressure apparatus with pipes in the reasons previously stated, an insanitary method. It is also due to the non-conducting accumulating on the pipes. (6) pressure apparatus, with small-bore outer walls or in channels, in coils skirting of raised wood floor on wheel seats. A useful and economical distributing warmth when pipes above the floors. By all these means air can be admitted to be warmed entering the building, but in many cases has not been done. Hot water radiators which fresh air can be admitted smooth, cleanable ducts above them, cleanly and cheap; effective boilers quite reasonable in price. Therefore, no good reason for placing in underground cellars or channels, allowing the bracing air to be cooled by passing through long dusty flues, water pipes or radiators can readily above the floor and under upper and roofs.

Physics of Air in Relation to Ventilation.

Mr. A. Saxon Snell, F.R.I.B., paper on the above subject, of the following is an extract:—"The movements of air and its behaviour under varied conditions have been observed and recorded by scientists, the results of intricate and costly experiments they have discovered difficulties and expressed them in algebraic and mathematical formulæ of fearsome length and complication. Others (calling themselves 'practical' scientists) have invented systems more or less, upon those laws. In their work, too, is not without too often they are handicapped by blindness to the defects of their

Brixworth Church.

Earl's Barton Church.

to affect those who attempt these things which are, in their nature, impurities, than that which is so supplied by nature. But conditions and ordinary people with a passion for purity suggest that purity (according to the only essential quality in air) of air is affected by so many and circumstances that it is impossible to design a system of ventilation which will automatically adjust itself to all circumstances. The means to be used are as simple as possible, and the occupying the building to make use of these means. In public places where numbers of people congregate, the control of the means of ventilation must necessarily be limited to persons, who would be guided by the Ventilation of the Houses of Commons. The ventilation of the Houses of Commons, for instance, is under the control of special officers, who must always be ready to deal with extraordinary conditions. For those who have comparatively simple problems of ventilation, scientific formulae are likely to be of little use. The fascination of proof by experiment is to be resisted. A general understanding of the physics of ventilation is more helpful and instructive. Of course, when we are confronted with abnormal conditions, we have to use abnormal means.

Means generally involve machinery, and the expenditure of energy other than that which is supplied by nature. The object of this short paper is to suggest a sense all enclosed spaces are for purposes of ventilation; and the fascination of machinery upon the mind is to be resisted. We are inclined to fly to it, and to rely upon natural ventilation. The object of this short paper is to suggest a sense all enclosed spaces are for purposes of ventilation; and the fascination of machinery upon the mind is to be resisted. We are inclined to fly to it, and to rely upon natural ventilation. The object of this short paper is to suggest a sense all enclosed spaces are for purposes of ventilation; and the fascination of machinery upon the mind is to be resisted. We are inclined to fly to it, and to rely upon natural ventilation.

Mr. H. Davies (York), speaking as a member of a number of air tests made in schools and factories, and the testing for carbon-dioxide was not. Architects, however, had to buildings not simply from the point of ventilation, and where they had to it could not be dealt with by ventilation. Further, if they trusted ventilation, especially in a factory, they were bound to have a very extensive system. As they knew, the Staffordshire schools was designed for cross-ventilation, but in the central-hall type of system. The difficulty was that if in one of the classrooms opened the door of the room the system was put to an end. If, however, they stopped the windows were opened, the rest of the building would not be interfered with for the co-operation of architects in the matter of ventilation.

Mr. Snell said he cordially agreed that the architect and the doctor and the chemist should co-operate in this matter. With regard to a factory of the description referred to by Mr. Davies, he would call that an abnormal building. He was not saying that mechanical ventilation was no good, and he agreed that it was good where the conditions required it. But do what they could with mechanical ventilation, it was not so good or so economical as natural ventilation.

Northumberland Schools.

Mr. G. Topham Forrest, Lic.R.I.B.A. (Education Architect, Northumberland County Council), described three Northumberland examples of experimental schools. In the case of the Choppingham School, he said, opened about a month ago, the street or road adjacent to the school site formed what was known as a "barrier" between two collieries of different ownership, so that the school was placed in as treacherous a position as possibly could be chosen. It was customary, he knew, for architects to lay a large raft of reinforced concrete over the whole building area. He was of opinion, however, that this was a wrong form of construction to adopt, and certainly in the case of this school such a treatment would not have materially assisted in minimising the risk of subsidence. Some other means, therefore, had to be adopted, more economical and efficient. From observations and experimental tests carried out, he came to the conclusion that some system of reinforced brickwork would meet the case, as this mode of construction would render the walls monolithic, and make the building infinitely stronger than if built with ordinary walls. Briefly, the system was to reinforce the mortar course with a wire mesh of best quality mild steel wire, galvanised, and having tensional wires running its entire length. This action of the wire mesh, when resisting tensional stresses was to reduce the sectional area, and this tended to close the meshes and compress the mortar, so that the latter developed its greatest strength—i.e., resistance to compression. The resistance arrested the tensional stresses in the wire, and was arrested by being held firmly by the bricks above and below it. With the mesh embedded in the mortar joint, the latter became the strength of the wall, and not a filling only, and the continuous bond rendered the wall monolithic. Reinforced brick walls, by reason of their resistance to tensional and lateral stresses, did not require to be of the same thickness as ordinary brick walls, whose strength was only in proportion to their weight. Heavy brick walls were only as strong as their foundations for weight-carrying purposes, and, should the foundations settle unevenly, cracks would appear throughout the building, but by reinforcing the walls with this 10 or 15 ft. could be taken away from underneath the building, and the walls would still remain intact and span across like a girder. He applied this form of construction to the Choppingham School, which was, he believed, the first complete school of its kind in the country. When the plans were in the first place submitted to the Board of Education they would not give their sanction to them. The Board eventually gave their sanction to the plans, and a loan was granted to the Education Committee extending over a period of thirty years. There were two departments, infants and mixed, each being a separate building. The former was built to accommodate 168 children, and the latter 400. It was with regard to the mixed department that the experiment had been tried. The school was built in three sections completely independent of each other, with the foundations and walls reinforced, the foundations on the Hennebique system, and the walls of the superstructure reinforced with wire mesh of best-quality mild steel wire, galvanised, and having tensional wires running its entire length. The school was built with a 9-in. cavity wall in place of the ordinary 14-in., and consisted of: a 4½-in. outer wall, 1½-in. cavity wall, and 3-in. brick on edge inside. For the classroom walls he had used a 9-in. cavity wall, consisting of two brick-on-edge walls with a 3-in. cavity between, and the partition walls were 3-in. brick on edge reinforced. The cost of the school worked out at 117. 16s. a school place, which was practically the cost of the better-class schools

in Northumberland. When they took into account the fact that building was about 30 per cent. dearer with them than it was in the West Riding, he considered that this school was remarkably cheap, bearing in mind the methods taken to strengthen it. All the walls were built in cement mortar gauged 2 to 1, and every precaution had been taken to ensure the safety of the children. Fire hydrants with long lengths of hose were fitted up inside the building, one in the infants' school and one in the mixed department; and emergency exits were provided, each fitted with panic bolts exactly similar to a theatre. The other two experimental buildings he intended referring to come under the head of the cheaper schools movement, and were both interesting examples. The first example was the new school at Barrington Colliery, about sixteen miles from Newcastle-on-Tyne. The school was constructed of wood on brick foundations. The brick foundations were reinforced in two alternate courses with three rows of best galvanised mild steel wire mesh, similar to that used in the Choppingham school. This mesh was in 2½-in. widths laid longitudinally along the total lengths of brickwork. The wood superstructure was securely fastened down by wrought-iron bolts and plates embedded in the foundations. The outside framing was formed with 4-in. by 3-in. posts, covered with a layer of felt and 1-in. G and T boarding fixed horizontally on the outside, and on the inside matchboarding covered with asbestos sheeting to form a dado. Above this dado the asbestos sheeting was fixed on to the 4-in. by 3-in. posts. The corner posts to the building are 4 in. by 4 in. The floors throughout were of wood joists and boarding supported on sleeper walls. The ceilings were formed with asbestos sheets, and the roofs were covered with Eternit slates laid on spars covered in the first instance with felt. This school worked out at 64. 10s. a school place. For colliery districts where the life of the colliery is uncertain he would strongly recommend a school of this description.

The other experimental building was the new school erected in the village of Hartley, on the east coast of Northumberland, about ten miles from Newcastle-on-Tyne. The school is a timber-framed building with slab casting, ferro-concrete foundations, reinforced with 1-in. steel rods and expanded metal; 4½-in. by 3-in. framing fixed to foundation, with holding-down bolts at angles and about 8 ft. apart around the building, angle posts of 2 in. by 4 in. framed to horizontal timbers fixed to all external angles, doorways, etc., ordinary framing 4½ in. by 3 in., with 4½-in. by 2-in. alternate studdings; 9-in. by 3-in. glazed ware air-gratings fixed at base of all framing, and holes bored through timbers for circulation of air throughout the whole of the framing. Bituminous damp-course was fixed below sole piece of framing; 2-in. "Fram" slabs fixed to framing on outside, rendered over surface with cement mortar floated to an even surface, and rough-cast with mixture of slag and pea gravel; 1-in. internal "Fram" slabs nailed to framing, floated and skimmed with washed hair lime and putty, and finished with putty and plaster throughout. A 3-ft. 6-in. dado was formed with Portland cement back and finished with Keen's cement, face trowelled and smooth. The roofs were boarded with clean redwood grooved and tongued boarding, and slated with asbestos tiles laid diagonally and fixed with copper rivets. The cost of the school worked out at about 54d. per foot cube for the building alone, but the fact must be taken into consideration that the building internally was finished exactly similar to one of brick or stone, and that, owing to the exigencies of this site and bad drainage arrangements, it was found necessary to install an accelerated hot-water installation, and other extras were also incurred. Provided a school of this description was built on a suitable site, it should be possible to erect a building which would work out at 5d. per foot cube, or even under that figure. The school was designed to accommodate 300 scholars, and the price per head works out at 64. 16s. 6d., but to this price must be added 525s., being the cost of out-offices and boundary walling, which were of brick and stone, similar to a permanent building, and also the tar macadam playgrounds and drainage.

(Our report will be concluded next week.)

THE SUMMER SCHOOL OF TOWN PLANNING AT HAMPSTEAD GARDEN SUBURB.

THE first week's session of the Summer School of Town Planning, which we referred to last week, was attended by a good number of keen students and visitors, but not, we think, as many as the great interest of the subject and the names of the lecturers upon its several aspects might have been expected to attract. Two and sometimes three lectures were given each morning in the lecture-hall of the Institute building, which shares with Mr. Lutyens' two churches the small plateau dominating what is fast becoming that phenomenon, hitherto strange to London, a consistently beautiful suburb—consistent, that is, in itself and with the rural part of its surroundings. Already some of its nooks and byways are acquiring the softened charm of old-time villages we know, with something added which, perchance, is of the new time to be. To the end of the week Mr. Ewart G. Culpin had lectured on Examples of Garden City Estates, Mr. Henry Vivian, J.P., on the financial aspect, and Dr. R.A. Lyster, M.D. (Public Health Officer to the Hampshire County Council), on the public health aspect. Engineering and surveying problems had been dealt with by Mr. W. R. Davidge, F.R.I.B.A., F.S.I., A.M.Inst.C.E., and Mr. G. L. Pepler, F.S.I., the first from the municipal surveyor's point of view; and interlarding and uniting all these Mr. Raymond Unwin had given the first half of his series on the general practice of town planning.

As we listened to these practical enthusiasts one after the other, each dealing clearly and definitely with his own department, yet with inevitable overlappings and repetitions, a stronger sense of the unity of the subject grew upon us. Its many aspects, problems, and functions group themselves under the three broad headings of Health, Convenience, and Amenity; and these again interchangeably express a perfect wholeness, a balance of parts, and the fitness which finds its fine completion and fulfilment in that beauty which is the aim of the architect.

The growing public interest in the movement is qualified by a certain shyness, the result of suspicion that it is more costly than the present system of development. This criticism and suspicion must be met; and this is the object of Mr. Vivian's paper.

He contrasts the town-planning and by-law systems, in that while the first devotes a greater area to the houses with a less number on the acre, but a less area to roads, and at least 10 per cent. to open spaces, the second devotes nothing to open spaces, save in the roads and house plots, but a greater area to roads, and allows a much greater number of houses per acre. Informed public opinion admits that a more generous treatment should be given in these three matters. This means taking more land, and that costs more money. The limitation of the number of houses on the acre means that less can be given for the land. On the other hand, it means quicker and steadier development; a greater area of land is taken up in a given time than by the old piecemeal method, and by its superior method of development greater security is afforded to adjoining areas. So that it is doubtful if even the private interest of the landowner would suffer much as a rule, as against the method of keeping the land idle for the higher price. There are not the same chances for the speculators and gamblers in land values, but that is a public benefit, and public opinion recognises that land must not, any more than machinery, be exploited for gain to the risk of the health of the community.

But economies are possible in other directions to meet the added expense of more generous use of land.

Town-planners claim that greater elasticity should be possible in roadmaking. While ample widths should be provided for main highways and traffic roads, and even then rules made to prevent building right up to them, much narrower residential roads might be allowed, and only so much actually paved as adequate for present purposes. It is difficult to estimate exactly the amount of saving thus effected, though certainly considerable. The question arises whether the local authority should take the risk of future expenditure involved. On the whole, their

risk is not great in making the concessions asked, and in return a number of advantages are gained, such as a lower number of houses on given area, consequently improved health of locality, smaller number of empties, and so less loss of rates.

In this connexion Mr. Unwin in one of his lectures gives figures which we only allude to shortly, as we understand they are to be made available to all interested in a pamphlet. He shows, *inter alia*, how reducing the number of houses per acre gross from 25.2 to 10.6 increases size of plot from 98 yds. super. to 398 yds. super., only raises total cost of land and roads from 43s. 8d. to 51s. 13s. 7d. and ground rent per week from 8d. to 9d. per house, and reduces price per yard of plot from 8s. 10½d. to 2s. 7d. Land in each case is taken at 300s. per acre.

In another lecture Mr. Unwin takes the cost of the smallest decent cottage, including land, roads, fences, fees, etc., complete, at a minimum of 180s. He shows that ½ per cent. in the interest on that amount represents 18s. if capitalised—i.e., the cost of a bedroom—and is more help than doubling the number of houses on the acre.

We agree with Mr. Vivian that thousands of pounds in ground rent are probably lost to landowners by lack of imagination and far-sighted policy. He applies a dictum of Lord Morley's—that the curse of modern industrialism is its insecurity—to the common method of development, pointing out how town-planning methods increase security both for landowner, developer, and investor. He also speaks of the necessity of considering large-scale balance-sheets in this matter, not for the first twelve months only, but over a long term of years; and in that case he thinks wise town planning is not likely to be more expensive than present methods. The present loss to the community must also be taken into the account, through inconvenience and loss of vitality caused by congestion of traffic and overcrowding, and the cost of constant necessary improvements. A more give-and-take basis of contract is required between the landowner and the estate developer of the one part and the local authority of the other; and, we would add, a better and more fully informed understanding between the latter and the public who appoint them, and whose interest it is their office to serve.

Mr. Pepler, in two comprehensive lectures, dealt with the engineer's and surveyor's problems, difficulties, and pitfalls from the point of view of the estate developer, acting, not in competition, but, so far as may be, in co-operation with the public authority. He illustrated his lecture by reference to plans of schemes in his own practice.

First of all, three main factors, means and possibilities as to water supply, sewage disposal, and access, have to be considered; the possibility or difficulties of connecting up with existing systems. Then the contour survey of the whole district dealt with must be made, and plan or model prepared. At a very early stage it is necessary to decide whether the delay and cost of preparing a scheme under the Act may be forgone; or whether, in view of nature of proposed development, or of stringency or peculiarity of by-laws, this must be incurred. If the latter, it is well to get the local authority interested at once, and to adopt the scheme to avoid still further cost and delay. Mr. Pepler thinks the authority will probably not town-plan in detail, but, while laying down main highways and traffic roads, and ear-marking areas for the larger open spaces for a long period ahead, will, under clear regulations, leave the filling-in to the changing ideas of successive periods. This, we take it, is a general rule applying to all cases, not to detail more than is to be dealt with at once. It certainly does not come within the province of the local authority except in special cases.

Mr. Pepler went, in some detail, into different systems of water supply and sewage disposal in the case of these having to be provided by the developer. These matters affect lay-out and parts to be developed first. The public prejudice against the private sewage scheme is a practical consideration, and also the position of the works. As regards water, the position of wells, and porous of impervious nature of top strata affect the proximity of buildings and start of development. It may also be requisite to provide for lighting, as at Cuffey, where an air gas plant will be installed, which can be placed among the houses and be added to as required.

Main traffic roads are fundamental and must be wide enough with eye to the future, and

straight and short as may be, to avoid traffic. Residential roads should be so as to give practicable building plots according to class of houses in parts of area. Aspect is not so for large plots as for small; nor is the residential as in traffic roads, latter 1 in 30 is about the maximum former 1 in 10. As a general rule, follow contours, but be variable by considerations. Factory area should be to main roads, canals if any, and so it is not safe to assume sidings.

Mr. Pepler also spoke of the construction of roads, grass margins, access to station and shopping centre of the preservation of all natural and We can only touch upon few of points treated by Mr. Unwin. In roads he said that lack of other open spaces was the most valid inelastic minimum width insisted by-laws. With the greater control town-planning powers, roads may, according to purpose; economic where merely approaches to dwell greater widths and stronger demanded in proportion to actual probable development. This, too, the variety and amenity of neighbour.

Mr. Unwin specified seven different 1. The footpath to groups of houses 10 ft. wide, open to road one end long. 2. The 20-ft. road, with 13-ft. way, 500 ft. long if open one end both ends, with turning places, 3. Non-traffic road, 16-ft. carriage footways, up to half-mile long in places. 4. The 42-ft. traffic road 50-ft. through traffic road with 80-ft. ditto with six lines 3-ft. margins to centre tramways, footways. 7. Up to 100 ft. or 120 ft. An important point is that tramways in centre, with at least narrow footways on both sides.

After illustrating the many forms of new main roads with varied cross-sections of fast and slow traffic ways, tram tracks, footpaths, grass and 3-ft. margins and avenues, Mr. Unwin certain American developments such as forecourts of houses open to road, and them as ornamental grass plot etc. This is well shown at Rochester, U.S.A. as other ornamental road treatments, doubt whether, for several reasons, of thing is applicable to any except country as yet.

Illustrating his remarks by a plan Mr. Unwin made clear the awkward waste of the 36-ft. or 40-ft. by-law houses on both sides out along a steep cross-gradient. By substituting roads 13 ft. to 16 ft. wide with houses side only, about 6s. per house is added making, but from 30s. to 35s. in building each house, so that both are practically, and aesthetically the same this development is apparent.

The esthetic treatment of the street was dealt with, the monotony of the blurring of features by sharp perspective improved by breaks and set-backs in building line and features at the presenting surface square to be by clumps of foliage and adequate features. The inherent advantage of straight street were noticed in spite of influence of public buildings or churches, and also the changing picture of road. All these points were illustrated in the screen and in a walk through the

Going on to speak of road junctions, Unwin referred to the difference between French ideas, the first holding for roads to enter singly, the latter to concentrate junctions in one place. Hénard's diagram of circulating traffic said that where there is much traffic the best system, provided that the line of road is sufficient to take the line of traffic, and sufficiently wide to get through. There is less space than by the ordinary holding-up. Yet it is doubtful whether the holding-up does not outweigh all theorising about points, etc., which may easily be far.

Slightly breaking the line of road with or without the formation of a closing the vista to one or more of

inconvenience to the traffic, but may advantage by easing the corners. Such to be learned from the study of cities, with their irregular streets in the way of securing good grouping, enclosure. The irregularity was more or less consciously planned artistic effects revealed. But it is get the same kind of effects with lines and crossings more formally

place to the importance of different place for civic or subsidiary centres, alluded to the grandeur of the open in Greek cities, which continued, in m. market-place, etc., till well into Ages. And as town life became less public spirit the exception rather rule, so also have these public town their closed street pictures de-

in went on to speak of the develop- in the lecture he made special reference at development of the children's especially in Chicago. Here they thirty or forty, the aim being to have d from 1 acre to 2 acres or more in half a mile of the dwelling- very child. These playgrounds are with implements for play, sand courts, rills, and field house, and are super- retaker or games master or mistress. Every work is given by adults, and ring and unlooked-for result is that rips, following the children in search n, are bringing their clubs, institutes, s round these play places, which coming foci of social life and promise into important civic centres.

in referred to the many other forms ices, and noted that in setting these town plan their special purposes defined from the first. To avoid ontage, those likely to be more or r, such as allotments or the ordinary yground, can be kept in the back- e centre space of large or awkward icks. Those intended for bowls, e purely ornamental or recreational ay be more or less open to the variously treated with regard to g of the houses.

his lectures was wholly devoted by to the civic survey. First he detailed in which must be ascertained or e starting to lay out a site as village e. These are:—(1) The kind of people ve in it, and the distance from main industry. (2) Means of transit and e. Class or classes of employees, ges earned, rents they can pay. (4) and most remunerative houses to necessarily the same. (5) What of each class and total number. (6) ings, other than houses, are neces- e built, allocate sites. (7) What ade for parks and open spaces, and e required; considered also, as an from point of view of revenue. (8) ough main road or connecting ed. (9) Preliminary estimate before an. What ground-rent required to ate return for development.

own extension planning on the large survey is a much bigger matter. The er, like the architect, must study his st know the town in every aspect of actors of place, work, and folk, as eddes puts it; to whose wide know- high authority in this matter Mr. rred. This knowledge must be e and compared for the town-planner in rent departments, and presented to aphic form. Such particulars as and force of winds, amount and days amount and movements of traffic, e changes, and movements of popula- e very much else, can be graphically diagrams and maps. Much is done this way, but much more is needed. rd to London, after what has been been recommended to be done, in the new main roads we are still in the sition that there is no one with any ee the recommendations carried out. e three Government offices, there is the County Council, and eighty local s, all with powers as to the traffic or rning. But things still continue to e for want of a co-ordinating e for the whole. We shall return to n's lectures later.

Dr. R. A. Lyster, M.D., B.Sc., D.B.H., Medical Officer to Hampshire County Council, said town planning was based upon the reasonable demand that everyone should have the chance of living in decent and wholesome conditions. Such minimum conditions are air space and ventilation, warmth, light, cleanliness, water supply, sanitation, dryness, and these have to be attained at reasonable cost, or the deficiency of houses causes high rents and overcrowding, and therefore either the numbers must be increased by grants in aid or wages raised to enable high cost to be met.

Landowners have been allowed to develop their land independently, and the result has been irregular development and overcrowding.

Housing and town-planning powers have been given to the wrong authorities; they should only be given to large county boroughs and county councils. Public health progress has been very uneven; factory conditions are far behind housing, hindered by the powerful vested interests involved; owners of small house property are usually poor. Factory inspection should be carried out under local supervision.

Bad housing conditions lower the vitality of the people, but no disease can be proved to be due to that cause. It is, for instance, one of many factors causing consumption; but housing reform and town planning will not alone stamp it out. It is necessary to go beyond the first steps in the investigation of these matters. One of the commonest causes of consumption is infected milk, and here again a strong vested interest makes it difficult to deal with tuberculosis in cows.

General infectious diseases probably do not attack slums more commonly than better-class houses, but, once broken out, spread far worse there.

Typhoid-fever has an affinity for dirty, insanitary, and overcrowded houses, and good water supply is driving it out. Bad drains never cause typhoid and diphtheria, but predispose thereto by lowered vitality. The lowering of infant mortality is essentially a matter of better food.

Dr. Lyster advises not to base arguments for housing and town planning upon statistical evidence now available. Unless properly "corrected," it may be quite misleading, as it is certainly quite unnecessary.

The movement aims at placing people on a higher plane of living than is possible for the majority at present.

We hope to commence our next article with notes on the lectures dealing with the problem from the points of view of the other municipal officers.

GENERAL NEWS.

Professional Announcements.

Mr. J. T. Blackwell, architect, 53, High-street, Kettering, has taken into partnership Mr. Charles Ridley, A.R.I.B.A., who has had some years' experience in the profession. The practice will be carried on at the above address, as heretofore, under the style of "Blackwell & Ridley."

Manchester School of Architecture.

Under the auspices of the University and the Education Committee applications were invited recently for a Professor of Architecture, the vacancy being occasioned by the resignation of Professor Capper, owing to ill-health. The appointment has been given to Mr. A. C. Dickie, A.R.I.B.A., of London.

Visit of German Town-Planners.

The visit of Continental town-planners to England from August 18 to August 29 promises to be an event of some interest. The visitors will number over 150, and the chief objective will be the inspection of the various Garden City and Suburb schemes in the country, which are now being copied in various parts of Germany. The arrangements are being made by Mr. Ewart G. Culpin, Secretary of the Garden Cities and Town-Planning Association, 3, Gray's Inn-place, W.C., who will be glad to give the opportunity to any English town-planners desirous of meeting the visitors. During their stay in England the headquarters of the party will be the Grafton Hotel, Tottenham Court-road, London, W.

Gresham College.

The plans and designs for the rebuilding of Gresham College, upon the site at the corner of Basinghall and Gresham streets, have been prepared jointly by Mr. Sydney Perks, City Surveyor, and Mr. D. Watney, surveyor to the Mercers' Company. The premises will comprise a lecture-hall, measuring 68 ft. by 40 ft., and having sitting-room for an audience of 500 persons, with offices above for the professors and executive staff.

The Princess's Theatre, Oxford-street.

We learn that the site of the Princess's Theatre is soon to be cleared for the erection, at a cost of some 600,000*l.*, of an hotel to accommodate 1,000 visitors. The theatre, which has been untenanted for several years, was built in 1880, after designs of C. J. Phipps, with 2,150 seats in the auditorium. Phipps's plans comprised a stage and wings 71 ft. by 42 ft.; pit, gallery, and royal box doors in Winsley and Castle streets, and foyer, with a balcony over the principal entrance—a very uncommon feature in that day of a London playhouse. The ground (nearly 21,500 ft. super.) is held under a lease, to expire in July, 1940, from the Howard de Walden Estate, at a rent of 1,600*l.* per annum. The site is that of the Queen's Bazaar, which, after a fire in 1829, was rebuilt for the "Physiorama" and similar exhibitions. The house was then taken by Hamlet, the wealthy silversmith of Cranbourne-street, for whom Nelson and Crace remodelled and decorated the interior, and was reopened on the night of October 6, 1840, for English opera and the then novelty of promenade concerts.

College Gateway, Worcester.

Conjointly with Mr. W. H. St. John Hope, Mr. R. F. Wells designed and executed in terracotta a set of eleven figures which have just been set up in the niches of the outer side of the Edgar Tower, or College Gateway. The statues are illustrative of the story of the see from its foundation by Ethelred, with Bosel as first bishop, 679, to the close of the Xth century, when the conventual church of St. Mary supplanted St. Peter's as the cathedral of the diocese.

Removal of Two Long-Established London Firms.

Messrs. Arthur Ackermann & Sons have just migrated from Regent-street, where they have continued since 1825, to No. 157*a*, New Bond-street, formerly the Mendoza Gallery. The firm was founded in 1783 in premises, formerly those of Lillie, snuff and perfume dealer, at No. 96, in the Strand, at the corner east of Beaufort-buildings (Savoy-court), by Rudolph Ackermann, who introduced into this country the illustration of books, mainly upon topographical subjects, with aqua-tints, lithographs, and similar coloured plates.—Messrs. Newton & Co., makers of optical, mathematical, electrical, and scientific instruments, who claim to be the oldest established firm of optical instrument-makers in the world, have removed from No. 3, Fleet-street, near Middle Temple Gate, to No. 72, Wigmore-street, W.; they have also opened a branch establishment at No. 37, King-street, Covent Garden. The firm, now consisting of Mr. H. C. Newton and Mr. R. S. Wright, were founded by a cousin of Sir Isaac Newton in 1704, and possess a business receipt dated in that year. They have occupied premises in Fleet-street during more than 200 years past.

An Ancient Theatre in Paris.

Madame Caristie-Martel, of the Comédie-Française, and granddaughter of the architect Auguste Caristie, who excavated the Roman amphitheatre in Orange, has begun a similar work in respect of the Arènes de Lutèce, in the Quartier Latin, where many old and decayed dwellings have been cleared away. A large stage is fitted in the middle of the ancient Roman amphitheatre, and room is provided for about 2,500 spectators upon the original tiers of the auditorium. Madame Caristie-Martel intends to give a series of classic spectacles, contests, and games in the revived Arènes.

Port of London Offices: Block Plan. Competitive Design by Mr. J. Reginald Truelove, A.R.I.B.A.

ILLUSTRATIONS.

Port of London Offices.

MR. J. REGINALD TRUELOVE was one of the six competitors selected to complete their designs for the new Head Offices of the Port of London Authority. In connexion with his scheme, illustrated in this issue, Mr. Truelove writes:—

"In the first scheme the tower was placed in Savage-gardens-square, where the post-office now is placed. It closed the vista of a new roadway across Trinity-square and through Savage-gardens. The tower was in the nature of a campanile, and, as the ground slopes gradually from Savage-gardens-square to the grounds of the tower, an uninterrupted view of the tower, right to its base, was obtained from 540 ft. away. The tower was practically on the central axis of the square. It would have emphasised the real centre line of the square, and so made an orderly lay-out. When Trinity House is rebuilt—as it must be some day sooner or later—then the tower would have risen from the centre of a great group of maritime offices. However, in obedience to one of the clauses in the final conditions the tower had to be moved, but for accommodation purposes the area had to be retained. This explains the irregularity of the Savage-gardens frontage. Even then the block over the post-office would make a good feature at the end of the street.

One of the principal features of the design is the lay-out of the surplus land, which, as calculated, would return a considerable proportion of the original outlay, which, it is understood, is somewhere near a million pounds.

The through road runs direct from Tower Hill to the neighbourhood of Fenchurch-street Station, the surplus land frontages face the main façade of the Port Authority's Office. The land so arranged would have commanded a very high rental. The figures are 290 ft. in the main road, facing the Port Authority Offices, and 170 ft. facing Trinity-square, to say nothing of the uninterrupted frontage towards Seething-lane, and the smaller new road terminated by the Port Authority Office centre pavilion.

The planning of the offices was conceived on the simplest and most direct lines, and it is maintained that here the public would find its way to any individual office in the building without the help of officials on point duty."

The Liverpool Repertory Theatre.

This theatre, converted out of the old Star Music Hall into a municipal theatre, is run on the lines of the Repertory Theatre, Glasgow, and Miss Horniman's Theatre, Manchester.

It is owned by over 1,000 shareholders, and the dividends are limited to 6 per cent. The essential requirements were provision for social intercourse, a good stage, and comfortable seating throughout.

The stage of the old Star Theatre being only 21 ft. in depth, property was acquired in the rear, and everything behind the proscenium arch was rebuilt. The auditorium was re-decorated and re-seated and tiers of boxes on either side were removed, and single boxes introduced in their stead. Under the auditorium there is provided a large foyer, a feature of the theatre, approached by wide staircases not only from the stalls and pit, but also from the circle.

This foyer, originally a beer-cellar, has now, by excavating, been converted into a place of

public assembly, where the audience congregates from all parts of the house. The foyer is the refreshment-room and off lobbies approaching it are ante-rooms.

The stage, which has been enlarged in depth, has been provided with modern stage equipment, and behind green-room.

Over the green-room is a painting under it a carpenter's shop, so that scenery may be produced on the spot. The stage have also been provided with dressing-rooms in addition to five existing over the wings, also room for a comptroller, stage-manager, electrician.

The decoration is based on the last century work of France, simplicity of position being realised by taking the scenium arch up to the full extent of the proscenium wall, and by treating the rich balconied openings in a plain wall.

The foyer, where less restraint is recalled as the basis of its design the a Roman villa and the trailage of garden.

The general contractors were Messrs. who completed the whole of the work, this being the contract for the plasterwork was executed by Messrs. Son, and the work is especially recommended for its spirit and refinement. The painting and decorating was done by Messrs. John Hunter, and the electric fittings by Mr. Banks, and the Messrs. Killick & Cochrane.

Baroque Architecture.

The illustrations of work by Michelangelo Palladio are used in connexion with the first of a series, which begins on the page to which we refer in our "Note" on

Model Colliery Village.

The Welsh Navigation Steam Coal Ltd., promoted a competition for a model colliery village in the Ely between Llantrisant and Tonyrefail. The competitions were not open to many who might otherwise have

entered, but the response, we believe, was good. The First Premiated Design (201) was won by Mr. Ed. W. Meredith, 52, Greystones-road, Ecclesall, Sheffield.

Magazins Modernes, Strasbourg.

Illustrations are given in *L'Architecture* for August 3 of M. A. Marcel's design which obtained one of the two first prizes in this important competition promoted by the Société

Française des Grands Bazaars at Strasbourg. Among the jury of assessors were M. Pascal and M. Laloux, members of the Institute of France. As an example of shop architecture on the grand scale this design is worthy of study. M. Marcel's equal in the competition was Professor Oberbaurat, of Karlsruhe. The second prize was won by Messrs. Muller & Mosselet, of Strasbourg; the third prize by M. Chaussemiche, of Paris; and the fourth prize by Messrs. Berninger & Kraft, of Strasbourg.

CORRESPONDENCE.

Public Appreciation of Architecture.

SIR.—The subject of the leading article in the *Builder* of August 9 is one of considerable importance. Some real appreciation of architecture by the public is a condition so much to be desired that it is strange more effort is not put forth to bring it about. The present time finds us with interest somewhat generally awakened in the subjects of town planning, garden cities (so-called), and—in our Metropolis, at least—in the newly-formed London Society. This is something to the good, and such a time seems opportune for driving home the important bearing on all these things of a general elevation in the standard of public taste.

Possibly no truth is more emphatically borne out by a study of the history of aesthetics than that the condition of the arts, at all times, has followed—more or less correctly—the general state of public taste. If the arts advanced—as in the heyday of Florentine culture, for example—it was because the people valued and encouraged them; if they declined—as in the decadent period of Rome—it was because the public were consumed with other interests or pleasures, and the general taste had become lowered. A review of the course of the Italian Renaissance indicates this application of the law of cause and effect very obviously, and it is apparent, too, in the corresponding period of our own history. Even the layman and the worker of those times thought and spoke with appreciation of Vitruvius, Alberti, Vignola, and Palladio—or rather what they represented to them; but we never hear them mentioned now. The fact is important only as indicating a vital change of view, and we ourselves cannot be acquitted of indifference to the example of the great architects of the past and the standard of refinement and taste set up by them.

Among the hopeful signs of the setting in of a change we may note: The encouragement now being given to art teaching in some of our Universities; the broadening treatment of architectural education generally (as in the case of the Royal Institute); the training of craftsmen in aesthetics as well as in the practical aspects of their work; and, incredible as it may

seem, some glimmerings in our daily newspapers of the truth that the amenities of towns and cities, and art in what we might call its universal or everyday aspect, are matters of concern for all citizens, irrespective of class or education, and not merely of the select and cultivated few. We shall have gained considerably if the truth of this comes to be generally admitted. The subject, to quote from your leader, is "of vital concern to architects; and none should be so qualified as they to inform and lead public opinion." On this account one is tempted to suggest the opening of a conference by the Royal Institute and the allied architectural societies of the United Kingdom in an endeavour to influence public opinion in the right direction. To do so would appear a vast undertaking, but it need not prove so, and someone must make a beginning. It is, anyway, perfectly certain that art, in its comprehensive sense, will make no very real progress until some general public appreciation—such as you indicate is desirable—is effected.

FREDK. R. HOENES.

FIFTY YEARS AGO.

From the *Builder* of August 16, 1862.

Road-Making.

A FRENCH inventor has recently built, or at least designed, a steam-roller to consolidate gravel and macadamised roads. The *Mechanics' Magazine* says:—A pair of cylinders, inclined at forty-five degrees, act on an outside crank on one end of the axle of the main roller or drum. The front axle has wheels as broad as can be, and is controlled by steering-gear similar to that used on steam-carriages and traction-engines. It is said that this machine will be better than horse-drawn rollers, because it can run both backwards and forwards with equal facility, be easily reversed, and work on a short piece of road until it is sufficiently consolidated.

* * It is not, indeed, such a long while since some 3 in. of metalling was raked over

the road and left to the action of the wheels of passing vehicles to a smooth and resisting surface. Drivers of horse-drawn vehicles, though they were to follow close tracks of each other, overlapped little until, at the end of some time, the rolling-in process was nearly accomplished.

The steam-roller, when it did appear in this country, was so long time as to be an object of curiosity such an everyday occurrence now across a road under repair forewarned familiar notice "beware of the steam-roller," beyond causing annoyance scarcely remarked. To-day, for one engineering firm alone, as we know, stocks as many as 200 steam-rollers for purposes of hire. When the once taken shape, there were advances in the type of construction made. The scarifier, however, in addition, fixed either in front of or dragged as a trailer, its purpose was to pick up the surface of the road, and the metalling. Driving power has improved in common with other steam-engines which are now on the compound principle, i.e., the steam from the high-pressure cylinder is utilised for the low-pressure cylinder. At work has a certain fascination, and the rapidity with which the surface is picked up and the saving of man-power impresses the most casual passer-by. Traffic may be good at tearing surfaces, but it is not good at rolling down, and the steam-roller and are indispensable in these days of wheels.—ED.

MONTHLY HISTORICAL REVIEW.

Fig. 1. Convent of Belem : The Cloisters.

THE ARCHITECTURE OF PORTUGAL.—VI.

(Continued from page 80.)

Examples of Portugal's characteristic style best known to foreigners are the buildings at Belem, some 3 miles down from the centre of Lisbon. They consist of the tower of São Vicente and the Hospital of the Jeronimites, which is separated from the mainland by an approach by John II. (1481-93) to guard his approach to his capital, and finished by his successor in 1520. The fort, which was separated from the mainland by an approach by the Tagus, now silted up, was destroyed by Garcia de Resende of Evora. It consisted of a tower some 40 ft. square and 100 ft. high, with a fortified bastion of the plan projecting from it into the river and surrounded by a wall enclosing a cloister (Fig. 2). The most remarkable features externally are the circular corbels out from each angle of the tower and bastion, and crowned by shaped stone roofs with knobbed pinnacles. The machicolated parapets whose openings are formed into the shape of shields and the Cross of the Order of Christ, the picturesque arcaded balconies of which are carried on stone corbels. The tower of Belem is, as a whole, of business-like sobriety, but such ornamental detail as it has is entirely late in style of the Manoelino sort, with considerable use of cable mouldings, and shows the influence of Renaissance influence except in the entrance doorway. The Jeronimites on the other hand, is one of the most richly decorated buildings in the country. It was erected by Dom Manoel in offering for the discovery of the route to India, and founded in 1498, but not completed till 1564. It comprises a church, a cloister, and a tower—the tower of Maria do Belem—with the monastic garden round a cloister on the north side,

and a wing over 600 ft. long extending westward in the axis of the church containing the undercroft of the dormitory and probably intended to form one side of a second cloister never carried out. Boutaca acted as architect till 1511, and Lourenço Fernandes after that, till the arrival of João de Castilho in 1517. The general disposition of the church, the earliest portion of the scheme to be built, would thus appear to be due to them, though the work seems to have been carried up but a little way by that date. About the same time as João there also arrived Nicolas the Frenchman, probably accompanied by assistants, who

executed the Renaissance ornament to be found in the doorways and windows of the church. It is certainly one of the most remarkable churches in Christendom. Externally something in the colour of the limestone—the same as that used at Batalha and closely approximating to marble—as well as in the enriched windows and doorway widely spaced in a large expanse of plain wall, calls to mind the Cathedral of Como, while internally the soaring columns and the wide spaces of mysterious gloom, shot through with rays of tinted light, inevitably suggest the duomo of Milan. The windows, rather too big in scale, are

Photo. by Marias & Silva.

Fig. 2. The Tower of Belem.

Fig. 3. Church of the Hieronymites at Belem : South Portal.

untraceried and round-headed, with deep external splay enriched with Manoelino ornament and flanked by a pair of banded shafts. The great south portal (Fig. 3) is a finely-conceived but intricate composition. Between two buttresses reaching to the openwork parapet a pyramidal arrangement of elaborate niches and statuary, crockets, and finials, frame in a round-arched and deeply-recessed double doorway and a window above it, and culminates in a lofty pinnacled canopy in two tiers.

The plan of the church is a peculiar one. The nave consists of five bays, but at the west the towers occupy the first bay of the aisles and the gallery runs out over the whole of the second. The transept, only slightly wider than the western arm, measures 95 ft. by 65 ft. It opens into a square chapel north and south and an apsidal choir of later date to the east.

The great wonder of the church lies in its vaulting (Figs. 4 and 5), a more fully-developed example of a system of which a hint had been given three-quarters of a century earlier at Villar de Frades. Aisles and nave are carried up to the same height of about 80 ft., and there is neither arcade to divide the nave from the aisles, nor transverse ribs to divide them into bays except at the entrance of the transept. Springing direct from the top of the piers, vaulting ribs of similar curvature, like those of an English fan vault, radiate in all directions, but, contrary to English practice, the fans do not touch or intersect, but are divided by portions of what is in effect a barrel-vault, stiffened by a rib system. The transept being undivided by piers, its vault soars even higher than that of the nave, and yet this mighty vault is of such solid construction as to have stood unshaken

when Lisbon was rocked to its core in the historic earthquake of 1755. The weakest point from the point of view in the design of the interior lies in (Fig. 4), which are slender octagons, only some 6 ft. in diameter, separated by strings, while the sides are carved with rather coarse work. One of the most original effects in the westward vista (Fig. 5) is the lower portion is lost in cavernous under the choir gallery, and, as gleams light up the richly-worked work of the Coro Alto. The chapter-house, and other monuments, as well as the cloisters, are likewise vaulted in a great variety of beautiful fashions. The piers, nearly square and in two stories, are strange Indian-looking tracery of arcade is deeply set back under a series of elliptical arches thrown from pier, one of them crossing each other (Fig. 6). The faces and piers, as well as the soffits and the arches, are carved with intricate work. The ensemble thus formed, over and over again, is as it is, has yet a weird suggestion of the exotic delights of a palace rather than the setting of a Christian religious house. almost the swan song of Manoelino the foreign artists who, under the Portuguese, were swarming into the country, as we have seen, already in the new art of Italy.

BAROQUE ARCHITECTURE I.—BAROQUE ARCHITECTURE ITS BEGINNINGS IN ITALY

OF all the many phases of architecture surely none which has suffered more from misunderstanding and ignorance than Baroque architecture. For years it has laboured under a curse, the curse of a name whose origin is lost in obscurity, whose meaning is doubtful of its value. But, like the majority of nicknames, it has caught a hold on the imagination, and is remembered in all its pristine brightness by the average man of to-day who knows little or nothing of its complete ignorance as to its origin. The purpose of this series of articles is to attempt some description of the criticism of the style in the principal countries of Europe, our first concern must be with Italy, generally accepted limits, our next step is to consider how far limitation is justified.

What, then, is Baroque architecture? Even Dr. Murray's infallible definition does not help us here beyond a point. The word is found in the form most familiar to us, in Spanish, in modern Portuguese, and in Italian. It has come from Africa to Portugal, and from Portugal to the present connexion it occurs in the name of Saint Simon (1760-1825). A plausible hypothesis is, that from the Latin (*verruca*) "a wart," it is applied by jewellers to ill-shaped stones (*barocca*), and at a later date to the bizarre, and the decadent in art in nature.

A second theory derives it from the term, *barocco*, meaning a figure of which draws conclusions from the but this is discredited by authorities. The first explanation, however, has a certain rational basis it may not have been remarked perhaps worth setting down hesitates before ascribing any greatness to Cellini, who surely of all men lived had too good an opinion of himself. But may not he and his fellow have carried this strange word of smiths' work to architecture? The statue of Perseus at Florence at the details of its beautiful pose these strange, uncommon, and departing from the well-trodden

once art, may we not imagine a jeweller-friends and admirers to the work the first slang word to their tongue-tips, a word in at their benches? The idea is no doubt, yet we know that in some smaller works of art we find the design which afterwards came called "Baroque" long before it the realms of architecture. And, we must account somehow for a which has become so important after its origin.

aside further speculation in this as futile, we next come to the of what is generally understood as baroque architecture, and how far justified in the position they have. At the outset we find another obstacle, for many writers draw no distinction between the words "Rococo" and "Baroque," which are in no way synonymous. The former term is usually applied to the purely bizarre or over-decorated examples of any post-Renaissance architecture and corresponds to "fantasy" in the Gothic period. We probably apply it also to many examples of Renaissance days.

Baroque is almost as uncertain in its meaning as "Baroque," but is usually derived from the French word *rocaille*, describing a rustic rockwork, and is French by origin. In France, and to some degree in Italy, there actually was a Rococo style in the middle of the XVIIIth century, and, especially, Spain, and England its influence. If the object of these articles is to perpetrate paradoxes it might be said that Baroque architecture is Italian, described by a French name, while Rococo is essentially a French phase, and is known by an Italian term. But a Rococo building often loosely described as an over-decorated building in any style, a Baroque building is a more definite example of a usually florid style, and one is a term applied to isolated buildings, the other in general to the buildings of a more or less historical period. And any Baroque buildings are Rococo, but not follow that all are. If this age of Ruskin it would be an irony for printing here in black type, term No. 1:—

terms 'Rococo' and 'Baroque' are interchangeable." being conceded, we arrive at another objection—that Baroque is used as a general term, yet that in all countries we find examples of architecture period so pure, so severe, and so

Fig. 4. Convent of Belem: Interior of Church, looking East.

obviously free from "the germ of the baroque corruption," that they cannot by any possibility be classed as anything but work of the Renaissance. An answer to this may be found very readily. Suppose we examine the more familiar architecture of our own country in the same way.

Are we to discontinue describing the Jacobean period as such because a Leeds merchant chose to build a Gothic church in Charles I.'s reign? Or must we cease

to talk of "Georgian" because in the Yorkshire villages we find many houses erected in the XVIIIth century with mullioned windows and semi-Tudor detail? A definition of an architectural period cannot be absolute, but it generally applies to ninety examples out of every hundred.

The Baroque period dates from the time when architects began to revolt against the pedantic rules of the Later Renaissance schoolmen, and it lasts until they tired

By Michelangelo. Illustrating the tendency to adopt Baroque elements in Michelangelo's later work.

of their untrammelled freedom and returned to their pedantry once more. As with contemporary movements in literature and other arts, its limits in architecture are different in every country and in almost every city of Europe. In some countries, such as Spain, it reaches the point of insanity, but its grades seem to be personal rather than local, and an exceptionally florid building is usually due to the work or influence of one wild brain, rather than to a prevailing tendency.

Baroque architecture is a normal development from Bramante's or Peruzzi's Renaissance types in Italy, of other Renaissance masters in other countries. It was encouraged by similar tendencies in painting and, as we have said, in minor arts such as goldsmiths' work.

For architecture is always the last art to feel a revolutionary change. It is too structural, too permanent, too eternal, one might almost say, to be blown from its course by every trifling æsthetic movement.

Lastly, the buildings of the Baroque period may, with few exceptions, be recognised by the general principles of their design and not by the abundance of their ornament alone. These conclusions might be emphasised in the Ruskin manner as *Aphorism No. 2*:-

"Baroque Architecture may be limited to an historical period, varying in date in different countries and cities, but in general beginning as the Renaissance spirit declined to pedantry and ending with the return to pedantry in the XVIIIth century. Its buildings may be recognised by the general principles which govern their design rather than by the abundance of their ornament."

Having defined to some extent the meaning of Baroque architecture, we will proceed to compare some of the criticisms which have been made of it as a whole.

As one reads these passages one cannot but regret that architects have so little to do with the forming of public opinion about their own craft. For while they are laboriously pursuing their calling as honest men should, bespectacled dilettanti with long hair from "our older Universities" are proclaiming to the world what the world should think about architecture, what styles are inherently good and what inherently bad (as if any style could in reality be either). So, although modern intellect in our profession has long ago embraced Baroque, consciously or unconsciously, though its characteristics are to be seen in most of the best public buildings of our day, the cultured man in the street is little further than he was when Ruskin told him to beware of "the foul torrent of the Renaissance."

Mr. Fergusson, for example, is now generally recognised as a critic whose most level judgments were on Oriental rather than on Western architecture, yet his influence on the British public has been enormous. His pen is not quite so bitter in relation to isolated Baroque buildings as we should expect, yet his conclusion is characteristic of most Victorian writers on the subject:-

"The history of Italian art may be summed up in a few words. During the XVth century it was original, appropriate, and grand; during the XVIth it became correct and elegant, though too often also tintured with pedantry; and in the XVIIth it broke out into caprice and affectation till it became as bizarre as it was tasteless. During the XVIIIth it sank down to a uniform level of timid mediocrity, as devoid of life as it is of art." Even if we allow something for this writer's well-known acidity, we find his opinions echoed in more recent times. Take, for instance, some of the thirty lines in Mr. Banister Fletcher's popular "History of Architecture," for this is all the space

devoted to a style which loomed over Europe:-

"The Rococo period presents an anarchical reaction, frontages, broken curves in elevation and a strained detail are the characteristics. Columns are placed in front and cornices made to break. Broken and curved pediments, scrolls, and twisted column features of the style. In the ornamentation is carried to an extraordinary degree without fitness or suitability, and exaggerated and badly designed often over-emphasised by sculptured figures in attitudes. . . . Carl Bernini, and Borromini are more famous who practised form of art. Among the most examples are the Roman S. Maria della Vittoria by S. Agnese by Borromini, churches at Naples."

Mr. Anderson's well-known book on Renaissance architecture is equally abrupt, but practically ignores mentioning him only in connexion of his work at St. Peter's. He ignores most of the principal Rome, and sums up his views in his final sentence, as follows:-

"By such freaks and capricious building of the era, certain of the Venetian works in composition, is more or less

More judicious and informing than these are to be found in books of a more historical nature, sources from which we have in all the works most in v

eral students we find the Baroque dismissed in a few paragraphs, cold and empty in tone. In fact, no hint is given that Baroque has its redeeming features, nor is he best informed of its extent, many undoubtedly Baroque in character some mysterious way excluded style.

justification were needed for a long series of articles to this may be found in these extracts from the most widely-read handbooks of the present day. There are many in our profession who at one time accepted these criticisms literally, and in the position of the present day, when first he visited Italy, believing that Baroque there was no good to be had, that in studying it lay the quickest road to perfection.

He expected to find in Italy a few brazen, but he found examples of the style still standing among cities of pure Renaissance and Pazzi chapels, a sort of living link to the lost souls of those who had created them, a stern and dreadful warning to all young architects.

Instead he found Rome a Baroque city, a classical quarter where the Baroque was laid. He sought for a pure building and discovered it with its faulty, measured its mouldings, and found it in a Baroque garden. He became enthusiastic about the Baroque, but remained placid till he saw Bernini's colonnade.

It is with all of us as we travel through Italy, or, for that matter, through other countries, too. In Venice and in Rome Baroque architecture dominates the nearly every smaller town away from the distant Lecce or up to Trieste Baroque architecture supplies the most beautiful and interesting features of the gardens and fountains, the terraces were almost all built during the XVIIth century.

It is easy to deceive a layman into believing that Baroque style is inherently bad by trading in the name and throwing dust in his

Palazzo Cagiali, Rome: Window.

eyes, but you cannot persuade an architect of to-day that the work which followed the Renaissance movement had no redeeming features, that its greatest achievements are as nothing compared with the infantile stages of earlier days. There are those who would place Cimabue and Giotto far above the vigorous Michelangelo, and with such people argument is useless.

We have passed the time when histories of art rang down the curtain at the year 1550, and the epilogue is as interesting and most certainly as instructive as the phases which precede it. Indeed this age of eclecticism, when every man prides himself on being able to appreciate everything, should be a particularly auspicious occasion for considering in some detail and with an open mind the monuments of Baroque architecture in the principal countries of Europe.

There are good reasons why in this brief survey the first place and the most careful study should be given to Italy, for in Italy we find Baroque architecture in its most diversified and interesting forms.

The charm of Renaissance culture in Italy lies in its infinite variety, in the varying genius which inspired art and literature in each individual city. The courts of the Renaissance, more pagan than in Imperial Rome, were brilliant centres where the

high-born and the talented jostled in merry intercourse with townsmen and common people.

It was to a happy, joyous, immoral Italy—a pagan, sociable, and wonderfully intellectual land that there came two upheaving movements, so that in a short time the whole character of the people, their art, their literature, their religion, and their very customs changed completely.

The first was the Reformation with all that it caused and led to, the second was the influence of Spain.

The Church in Italy at one time appeared to be hard pressed to defend herself against the Reformation movement, but liberal tendencies from within proved a strengthening factor and saved her from disaster. Her ultimate triumph over heresy, her wonderful success in stamping out opposition in every form, is largely due to the invigorating influence of the great XVIth-century Orders, the Capuchins, the Theatines, and, above all, the Jesuits.

There is nothing more remarkable in that century than the formation of this Society of Jesus and its instant magnificent triumph. The Theatines and Capuchins had done wonders towards creating a more devotional and serious spirit within the Church, but the Jesuits became in a very few years masters of the situation. Their rules and tenets appealed to the minds of educated men, their

vows secured complete secrecy and complete subservience, above all, their wonderful new educational system ensured that the next generation would have imbibed their principles and would spread them through the world. It was the success of the Jesuits which carried the Church to victory through the difficult times of the Reformation; it was the wealth and power of the Church which is responsible in one way or another for almost all the most famous buildings, religious, palatial, or monumental, of the Baroque period.

The influence of Spain is of almost equal importance to us. We find in Renaissance times a fine democratic burgher spirit existing all over Italy, a striving among artists and writers to excel one another for their craft's sake, a strange freedom from social barriers, and a glorious abundance of *joie de vivre*. The Spaniards changed all this. Black garments for gentlemen of rank displaced the gorgeous fabrics which formed so staple a part of Italy's manufactures, cloistered seclusion or dishonest intrigues for ladies took the place of the easy and stimulating manners of the Renaissance courts. An elaborate code of etiquette ruled the world of society. It was deemed ignoble to work with hands or brain, and militarism took the place of civic pride. Every comfort was sacrificed among these erstwhile gay Italians in order to share in the trumpety titles bestowed by Spain, to make a brave show before the world, to display a dazzling retinue of servants and carriages. It is, then, to the Spanish supremacy that we owe the formality and ostentation of this period, the inordinate craze for heraldry and external ornament, the fine staircases and façades, the stateliness and the dignity of it all.

Music and science began about this time to make great strides in Italy, for writers were debating their art by becoming fulsome flatterers, and artists came at last to be often only the employees of wealthy patrons, so that intellect sought a new object.

But one must not forget that this whole Baroque movement had its parallel in other countries, in the "quaint conceits" of the English Euphuists or the *Précieuses* in France. There was an artificiality in the atmosphere which explains many things, and the hypocritical stiffness caused by an admixture of Spanish etiquette with the counter-reformation concealed as loose a moral code and as pagan a mind as ever marked the Renaissance. The Baroque movement was largely due to the Jesuits and the Spaniards, but we will examine in detail the usual opinion that it first found vent in the work of Michelangelo and Palladio.

It is difficult for one who believes, in common with most of his generation, that Michelangelo and Palladio were by far the greatest architects of the Renaissance to wholly appreciate the view-point of those who swear by Peruzzi's mouldings or Brunelleschi's dome, by Giotto's tower or Sangallo's churches.

Rather than Ferguson's talk of his "dreadful vulgarities" and "fantastic details" we think of Michelangelo in the words of an anonymous writer whose criticism lies by me as "one to whom the service of beauty was a religion." We remember his long struggle against enemies and circumstances, and how he lived all his life in the midst of intrigue and treachery, though he was a lover of simplicity and solitude. We recollect his reply to the Cardinal who had been persuaded to hold an indignation meeting during the building of St. Peter's, and who protested that the choir would be too dark. On being told that there were to be three windows more than they knew of, the Cardinal complained that this was the first they had heard of it. "I am not, nor do I mean to be, obliged to tell your lordships or anybody else what I ought or wish to do. It is your business to provide the money and to see that it is

not stolen. As regards the plans of the building, you have to leave them to me."

He was far above them, a man whose name is famous when the Pope and the Cardinals, the jealous clerk of work, and the pettifoggish committee are all forgotten. He will remain one of the world's greatest men when his carping critics' platitudes are out of date.

A pedantic hack with a 2-ft. rule and a book of Orders may find mistakes in Michelangelo's detail; that does not alter the fact of his magnificent achievements of art, of his sculptural architecture, or his architectural sculpture and painting. He is responsible for the "barocco corruption" only in so far as he first introduced into Italian Renaissance architecture a boldness of conception and a vigour of execution which may, in all justice, be considered, not as the first step of the decline, but as the grand culmination of this great period.

And what of Andrea Palladio and his city of Vicenza? Palladio's reputation has withstood many severer attacks, and will resist many more. Every year his genius is the more appreciated and his

are furnished with the fairest to demonstrate their own excellent and surprising inven-

The words italicised show was no stickler for pedantry bears it out; yet in this case, a fairer to him, and in all ways m to admit that he prepared Baroque, as did Michelangelo eccentricity or vulgarity, but by and appropriate originality of powerful mind.

Palladio's inventive faculty the direction of the general a design rather than in its le details, yet in each respect his reproach. As regards the form exhibits a wonderful freshness applying his orders to any sort of building. He it w familiarised people with the as a new feature in building borrowed from ancient Roman many things that the pure-soul of the Early Renaissance shrin uplifted hands.

The "motif Palladio" is no Diocletian's palace at Spalat, probably first reused in the X by Peruzzi.

Palladio certainly broke established custom in some can detail also. His use of sculpt has aroused much criticism, and the idea of reclining figures from and Sansovino. Though he broken pediments, we find brot tures in several cases (again a late classic models). His villas display all the ostentation and of the Baroque examples, yet position is for the most sus-

suspicion. It is both despicable and ignorant him with the poverty of the mat misfortune placed to his hand, beautiful palaces because the peeling off their façades, and patrons were, in many instances monious to provide him with th which he designed his buildings.

A purist who will abuse the st will find himself hard put to it to marble of 1450, and to say wit Renaissance marble-covered ce more laudable than a str Palladian palace. But there similar points of which our f architectural critics of architec very determined and so remark Palladio's genius has been admira up by Mr. Banister Fletcher in the

To determine whether Pa Michelangelo can be actually held for the introduction of Baroque into Italy is by no means easy, almost so when we view their l comparison with what appear accepted views on Baroque a They may have prepared the wa certainly did not venture on th path themselves.

MURAL PAINTING

The design illustrated on the ne exhibited at the recent Exhibition Painting, held at Crosby Hall, was successful in obtaining the of 25, in Section 8. It is the v Stanley North, who, under the m of Boreas, drew forth the crit newspaper which stated that it w petent and craftsmanlike design, the best period of Gothic decorati has also, we understand, met v commendation of Mr. Aitken, of t Gallery of British Art.

Doorway at Assisi.

principles adopted. Nor does it seem that his genius is so utterly at variance with Michelangelo's. He, too, strove for the dignified and the grand, but from the standpoint of the architect rather than of the artist-of-all-trades. He adhered a little more closely to rules because from boyhood he had been brought up on rules, whereas Michelangelo came to them late in life. It was not in his rules that Palladio's genius lay, but in his application of the accepted Orders to all the varied problems of architecture, in his ingenuity and inventive faculty. So although his latest biographer says that:—

"His style in general has been defined as a mean between the severe use of ancient forms and the licentious style of those who reject all rule whatever."

He also quotes Palladio's own words on public buildings:—

"Wherein, because they consist of larger dimensions and that they are beautified with more curious ornaments than private ones as serving for the use and convenience of everybody, princes have a most ample field to show the world the greatness of their souls, and architects

as is shown, represents St. George on a dragon. It is executed in tempera on a background of flat gold. The knight takes place on a sword between the palace and the town, and the King's in her bridal robes, bound to a tree, with the last sheep unslain by St. George, wearing a wreath of plucked from the bush near the direct and calm in his righteous cause. The scene is covered with flowers, which form a pinlike pattern in many hues. The more stealthy than strong, bends his frantic efforts to guard its deadly this is a fight between vice and her than a test of mere physical The whole scheme has a pleasing il-over pattern, there being, broadly three lines—the gold background, the of the horse, and the green sward. The position is very decorative in its flat. The trees on the gold are con- and the palace and town carry the horse through the picture. The harness, the cross on the tabard, and the roofs of the houses, has its The black helm on the ground and of St. George form a note which is decoration. The blue bridal robe dress, with its pattern of gold, is again the lining of the tabard and the

size painting will be executed on the London County Council School Street, St. George's-in-the-East. The painting is similar to that used in the of the ten portraits in the National probably of the second or third of our era, from Hawara Cemetery, Egypt, and discovered by Mr. W. M. The pigments are mixed with laid on in the melted state. Wax is almost unchangeable by time, and its is most assured, for the pigments are in their medium as to be from the bad atmospheric conditions

HISTORICAL NOTES.

NO LESS than three estates formerly connected with monasteries are for sale. Two of these contain ruins of priories—Hardham, near Pulford Monk's Horton, near Hythe. The is the fine house of Monks, near Monk's Farm, and many acres of grounds. It is seldom such a glut of historical properties come under the and the fact is worthy of a record in

A HANDSOME dwarf chancel screen has been erected in this church to the memory of the late Mr. J. Wrigley, J.P., and a former churchwarden, prominently identified himself with work of the district. The screen is in oak, and has been designed by Mr. Hindale, of Carlisle, and is in two bays and south, each consisting of six carved and canopied panels with carved ends are returned east so as to form stalls. Already there are several windows in this countryside church, which fair to become one of the most in the county.

THE castle of the famous Rob Roy built in the XIIIth century on an island in Loch Dochart, and known as Loch Dochart Castle, has been taken by the Scottish Historical Antiquarian, and is being renovated to ensure its permanency. The castle formerly belonged to the Campbells of Lochawe, and is the property of Mr. William Christie, who has given substantial financial assistance to the castle is said to have served Bruce after a defeat by the Lord of

IN the Norwich Consistory Court Mr. Chancellor North recently gave judgment in the case of the removed footpace from the chancel of St. Andrew, Ipswich. The step in question had been the subject of several times, and at last the Rector took upon

himself to remove it, without first obtaining a faculty authorising him to do so. The Chancellor's decision states that no structural alteration may be made in any part of a church without a faculty, backed in the first place by the vestry duly summoned, and then formally issued by the Chancellor of the Diocese in his own Court, authorising what is proposed to be done. The fact that it was sought to remove what, in the first place, had been illegally introduced or erected did not take the matter from the jurisdiction of the Court. No incumbent may be a judge in his own cause. It was urged by the defendant that the step was removed by his orders as it was a source of danger to the celebrant at Holy Communion. The Court ordered that, as the step had been removed without a faculty, it must be restored.

Hackney (Old) Church.

A FUND is opened for the repair, at an estimated cost of 500*l.*, of the tower of the old parish church of Hackney. It is also proposed to obtain a faculty for conveying the site and fabric to the Borough Council. The XIVth-century tower and Sir Henry Rowe's chapel (1614) are all that remain of the old parish church, dedicated to St. Augustine, of which the nave and chancel were rebuilt in 1517 by Sir John Heron and the Rector, Christopher Urswick. The present parish church of St. John was erected in 1792-7, for 2,500 sittings, after James Spiller's designs in the Græco-Doric mode (sometimes attributed to Sir Robert Smirke), and is remarkable for its plan—that of a Greek cross, the four arms, with pediments, being 21 ft. deep, and for the large area at the crossing 63 ft. square, which is covered by the roof that has no interior support. The steeple and five porches were added in 1812-3. A curious hand-pillory, on wheels for flogging, was found in the tower about twenty years ago. Edward de Vere, Earl of Oxford, was buried, 1604, at the foot of the tower; amongst the earlier memorials preserved in the new church is that of (1537) Henry, fifth Earl of Northumberland, Henry VIII's rival for the hand of Anne Boleyn and a judge at her trial.

The Old Conduit-Head, Queen-square, Museum. Popularly known as the Devil's, or Chimney, Conduit, it lay beneath the soil in the garden of Chalfont House, No. 20, Queen-square, and supplied water to the Grey Friars Convent and, latterly, Christ Hospital. The hospital continued to derive water from that and other sources in Bloomsbury, amongst

them being those in Red Lion-square, in the fields now traversed by Bedford-place, and in and about Lamb's Conduit-street. The Queen-square conduit-head seems to be of early XIVth, or perhaps late XIIIth century date; a flight of steps descended to the vault covering a tank, the stone masonry, in good preservation, having many initial letters and a date "1600" cut therein. Some fifty years ago there were in the garden of No. 30, East-street a pump and spring with a stone bearing an inscription stating it was "the head of the spring Lamb's Conduit Water." In 1577 William Lamb, citizen and Clothworker, rebuilt the Snow-hill conduit (1497) and laid pipes therefrom to a head just beyond Great Ormond-street. That well-head was shifted in 1746 after the building of the Foundling Hospital to the yard of the adjacent "Lamb" tavern where, in 1851, J. W. Archer found under the pavement a flight of steps, a bricked vault, and the well. Archer's drawings of the "Lamb's Conduit" in Long-yard and that in East-street are in the British Museum.

Egyptian Blue Enamel. THE famous blue enamel or glaze produced by the early Egyptians, and of which many fine examples remain to this day, appears to have been prepared with a copper oxide, and the process was employed as early as the year 1600 B.C. Enamel has for basis a fusible and colourless glass, rendered opaque and coloured by the aid of metallic oxides, fused, powdered, and washed before being applied to the surface to be enamelled. The process is completed by firing the whole in a suitable furnace.

Long Marston Church, Norfolk.

A FACULTY has been granted in the York Consistory Court to the Rev. Edmund Baddeley, the Rector of Long Marston Church, for the erection of some carved oak panelling at the east end of the church, and the placing in the edifice of a tablet containing a list of former rectors of the parish. The church, dedicated to All Saints, originally stood on a hill a mile distant, but the structure was taken down in 1400, and built on the present site with the same materials. It is a stone building in Norman and Early English styles of architecture, containing chancel, nave, north aisle, and embattled western tower, with pinnacles. It was restored in 1869 under the direction of the late G. Gilbert Scott, R.A., and contains memorials to the families of Thwaites (1602), Thompson (1740), Roundese, Micklethwaite (1681), and Smith (1820). In the chancel are some choir stalls bearing much carving.

Design for Mural Painting. By Mr. Stanley North.

THE BUILDING TRADE

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS OF GREAT BRITAIN AND IRELAND:

SUMMER MEETING AT NOTTINGHAM.

(Concluded from last week, page 183.)

IN accordance with arrangements, Mr. J. F. Mathieson, one of the National Health Insurance Commissioners, and Mr. G. W. Irons, of the Board of Trade, invited members to question them on any points on which they desired information regarding the Insurance Act. Numerous questions were asked and answered, the chief interest being centred in a reply by Mr. Irons regarding the option which employers have of arranging with the Labour Exchanges to stamp their cards. This gentleman said that any employer entering into such an agreement could engage his workmen where he pleased, but labour which was engaged outside an Exchange could not be part of the arrangement for stamping cards by the Exchanges. They would continue to stamp the books of the men who were in employ at the time the arrangement was made and of those men who were subsequently engaged through an Exchange, but men engaged in other ways after the arrangement had been made would have to have their cards stamped by the employer. At Leicester practically every large builder had come into the arrangement, and they had given facilities which they believed would result in all the cards and all the books being kept at the Exchange, and the men being engaged through the Exchange. The system was working quite smoothly at Leicester, and he had similar reports from Burnley, Preston, and Bolton.

Asked how the Labour Exchanges would register disputes in the building trade, Mr. Irons said that their only means of registering disputes was that they would provide facilities both for the employer and for the secretary of the unions concerned to say exactly what the dispute was. All applicants for work would be told if the union had a dispute with an employer, and they could please themselves whether they would go or not.

Mr. Mosse (Liverpool) asked whether, supposing there was a dispute with an individual firm, the Labour Exchange would register the dispute without communicating with the employer or with the employers' association.

Mr. Irons replied that, as a matter of fact, there was no obligation upon the Exchange to do either one thing or the other. If either side notified them of the dispute they would notify it to the workman. If they had the two statements they would communicate them to the applicant for employment, but if they had only one statement they could only give the one.

Mr. Mosse said that in view of that statement he thought it behoved the Federation to leave the Labour Exchanges severely alone. If they tied their hands to take all their labour from the Labour Exchanges in twelve months' time every operative in the building trade would apply to those places for work, and should an employer have a dispute he would have to look out the whole of his men, and he would not be able to get fresh men by advertising in the newspapers as he could at present.

Mr. G. H. Wright (Birmingham) raised the question of position of contractors under the Insurance Act who had entered into contracts prior to the Act, and who, therefore, had not been able to recoup themselves the extra charges they would have to pay. He said that, as a rule, when any new burden was imposed upon contractors by Act of Parliament, they had definite notice that the Act would come into force at a particular date, and they were able to cover themselves. In the case of the National Insurance Act contracts had been entered into during the first six months of this year, and not a single contractor knew before July 14 whether the Act would come into force on the 15th or not. Under the Act the King in Council had power at any moment before July 15 to postpone the Act until January 15, 1913, and contractors evidently assumed that it would not become law until then. He did not suppose that a gathering like that could go fully into such a question, but he thought the

Council might take the matter into consideration to see whether it would be possible to recommend all contractors who had entered into contracts during the first six months of 1912 to make some claim upon the building or works proprietor for a recoupment of the money they would have to pay in the form of national insurance until January 15 next. It might be advisable to take counsel's opinion on the matter.

Mr. W. Thomas (Cardiff) said that in that town a contractor had made application to the Corporation for his extra expenses on a contract owing to the Insurance Act, and the Town Clerk had advised the Council to take counsel's opinion. He suggested that it would be well for them to let the matter stand in abeyance until they learned what the Cardiff Corporation did.

Mr. A. J. Forsdike (Sheffield) said he hoped the Federation would get counsel's opinion. He had no doubt that there were many gentlemen present who were in the same position as himself. He had two contracts running that were made before January 1, 1912, and therefore it was absolutely impossible for him to make any provision whatever for this extra charge. He thought that each of the affiliated associations should take this question seriously into consideration and arrive at a common understanding so as to give their architects notice that they would eventually make a claim for the charge.

Mr. Mosse proposed a resolution asking the Administrative Committee to take counsel's opinion on (a) what is a contractor's position with regard to the Insurance Act, parts 1 and 2, under contracts entered into prior to the Act being passed, and still being carried on? (b) what is a contractor's position under the Act of contracts entered into after the Act was passed but before the Act became law, and still being carried on? and, further, to draft a clause to avoid such burdens being imposed in future in respect of contracts running.

Mr. W. H. Hope seconded the resolution, which, after some discussion, was carried.

The Secretary read a communication from the Engineering Employers' Association asking the Federation to recommend their members not to pay the workmen's contribution under the Insurance Act.

The President said he took it that would generally be done, but he thought they should make an exception in the case of indentured apprentices.

After some discussion a resolution was agreed to to this effect.

On the proposition of the President it was agreed that the next meeting of the Federation should be held in London.

The President moved the following resolution re Valuations under the Finance Act, 1909-10:— "This Conference of building trades employers of the United Kingdom records its unanimous and strong protest against the practice of undervaluing house property by the official valuers under the Finance Act, 1909-10, which obtains, many of the valuations being 5 per cent. to 15 per cent. under prime cost. As a result the confidence of investors is shaken, sales are stopped, and severe depression exists in this branch of the building trade, and serious loss accrues to those engaged therein. This Conference respectfully asks that the Government will institute an inquiry, which it has confidence will result in improved methods of valuation being adopted." He said he had a few cases illustrating the position in Nottingham. The first valuation he had referred to a block of property which cost him 3,455*l.* to build—the prime cost. The provisional valuation of that property was 3,075*l.* The site value of that provisional valuation was put down at 354*l.* and the prime cost was 60*l.* 15*s.* He had other instances where the depreciation amounted to anything between 15 and 25 per cent. He had a letter in his possession from one of the most reputable firms of estate agents, in which they said that their experience had taught them that all classes of houses and buildings had suffered a decline in value in consequence of the Finance Act of 1909-10. Investors had become so frightened, and lenders of trust moneys had become so alarmed, that the calling in of mortgages had practically ruined many

small people. There was no doubt that the method of valuation was having a very damaging effect upon the building trade, and they were fully justified in protesting.

Mr. Mosse said that the Government Committee to go into the question of valuations, and he would therefore that instead of asking for an inquiry, they should ask the Government to receive the Federation.

The President said he was pleased with what Mr. Mosse had said, and was willing to fall in with his suggestion, and should ask the Government to receive the Federation.

Mr. Smethurst seconded the resolution.

Mr. W. Moffat said he hardly thought the resolution was strong enough, and if that they had had at Nottingham were written to the extent which the President suggested, all he could say was that he was more fortunate than they were at Nottingham. He had the case of certain land firm was interested. A sale took place at 14*s.* 6*d.*, and recently a sale took place at 14*s.* 6*d.* The provisional valuation was 6*l.* 10*s.* 6*d.* The case was a piece of land of 300*l.* It was sold in 1865 for 300*l.*—the value at the time it was sold with building contracts was 1,400*l.* in 1872, and the value at the time was probably about 1,600*l.* The valuation was 385*l.* Another case was a piece of land in one of the best suburbs in Birmingham, which so the executors' reserve at the sale was 400*l.* The provisional valuation was 400*l.* was needless.

Mr. Sinclair (Scarborough) and Mr. W. Moffat supported the resolution, and Mr. Smethurst strongly criticised the resolution, in which the provisional valuation was made, and pointed out that Mr. L. in reply to the deputation which had come to him from the Federation in 1910 stated that any increment which was added to the man's skill and brains having been capital did not come within the Finance Bill. He moved that the Administrative Committee be requested to consider the advisability of taking the case before a referee to see whether it was correct or not.

Mr. Thomas (Swansea) seconded the resolution, which was carried.

Votes of thanks to the Mayor for the hall, and to the President for concluding the proceedings.

GENERAL BUILDING

NEW CHURCH OF ST. MARY, DORSET.

The new Church of St. Mary, Dorset, which has taken the place of the iron structure erected fifteen years ago, has been designed by Mr. C. E. Ponting, architect, and is capable of seating 100 people. When completed the tower will be 123 ft. high and 25 ft. square to the buttresses. A feature of the tower is the lofty east end, with its richly decorated window, which together with the tower at a height of 53 ft. is a conspicuous landmark. The new church is a simple nave, with a chancel, aisles, and transepts, and a south transept and the chapel of the Annunciation. The chancel is 132 ft. long and 40 ft. wide, and is a fine example of a temporary church, and there is a series of oak rising on each side of the window. The church was illustrated in *The Builder*, December 1, 1911.

TAUNTON PARISH CHURCH.

It has been decided to complete the restoration of the ancient Parish Church at a cost of 650*l.*, towards which has been raised in a few days. The restoration will comprise repairs to the windows, and the removal of the old roof-screens, and the erection of a new close screen. The structure stands on an old Augustinian priory, and is a fine example of a temporary church, and there is a series of oak rising on each side of the window. The church was illustrated in *The Builder*, December 1, 1911.

LONDON SCHOOLS.
 none of the original Board schools, New-road, Clapham; Creed-place, Clapham; Caledonian-road, Islington; Starham; and Vicarage-road, Woolwich, reconstructed. Works now in progress London County Council include the of four secondary schools, two central one special school, and one technical the extension of the school of art; adding or enlargement of twenty-three and the execution of minor improvements—twenty-seven schools.

James Brooks, Son, & Adkins are architects for a chapel now being erected by the Baptist Church, Holland-road, London, by Messrs. E. A. Roome & Co., architects, E.C.

plan New Picture Palace, Manchester, ventilated by means of Shorland's exhaust roof ventilators and special ventilators, supplied by Messrs. E. H. & Brother, Ltd., of Fallowfield, Manchester.

O'Brien, Thomas, & Co., of 17 and Thames-street, E.C., and Excelsior Hat-cham, London, S.E., have recently

supplied to Worthing two of their school grates with porcelain enamelled faience mantels and canopies. The new isolation hospital at Shepton Mallet has also been fitted with the D. O. Boyd hygienic double-fire ward stoves with porcelain enamelled casing for the ascending smoke pipe. In addition to these, grates have also been supplied to Wishford for the local school, also to various schools under the Huntingdon Education Committee and the Buckinghamshire Education Committee.

FLEET (HANTS) SEWERAGE.

At a meeting of the Fleet Urban District Council held on August 1 the Fleet Urban District Council passed a resolution adopting the scheme prepared by Mr. T. J. Moss-Flower, G.E., 28, Victoria-street, Westminster, and Bristol, for the main sewerage of Fleet, Hampshire. It was decided to enter into a formal agreement with Mr. Moss-Flower for him to act as engineer for the scheme. The scheme involves upwards of 16 miles of sewers, lifting plant, new disposal works, etc., and the estimated cost is 30,000. The scheme adopted was submitted in a limited competition, the adjudicator being Mr. H. Percy Boulnois, M.Inst.C.E.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Training centre (12,000); Mr. J. A. Allan, architect, 25, Union-street, Aberdeen.

ATHERTON (MANCHESTER).—Four houses, Birch-road, and offices, Orchard-street, for Messrs. Bakemore & Co., Ltd., bolt and nut manufacturers, Atherton.

BATLEY.—Warehouse for Messrs. J. T. & J. Taylor, Ltd., woollen manufacturers, Station-road, Batley.

BIRMINGHAM.—Extensions to sanatorium, Vardley-road (29,000); Mr. H. E. Stilgoe, Surveyor, Town Hall, Birmingham.

BISHOP AUCKLAND.—Hospital (7,000); Mr. R. B. Thompson, architect, Market-place, Bishop Auckland.

BLITH.—School (10,000); Messrs. Fenwick & Robson, architects, Pearl-buildings, Newcastle; Messrs. Robinson & Waddell, builders, Blith.

BRANCEPETH (CO. DURHAM).—School (4,000); Mr. W. Rushworth, Architect, Shire Hall, Durham.

BRANDON.—Alterations to school, High-street (3,500); Mr. F. R. Hughes, Secretary, West Suffolk Education Committee, Bury St. Edmunds.

CARDIFF.—Workmen's dwellings; Mr. W. Harpur, Engineer, City Hall, Cardiff.

CHESHAM.—Post-office; Mr. Jesse Mead, architect, Berkhamsted-road, Chesham.

COVILLY.—Hospital; Mr. J. T. McCarthy, architect, Central-chambers, Leicester.

COGGESHALL (ESSEX).—School (5,000); Mr. F. Whitmore, architect, Duke-street, Chelmsford.

COVENTRY.—Electric sub-stations in Gordon and Teleshill roads, also additions to offices at electric light works; Mr. J. E. Swindlehurst, Surveyor, Town Hall, Coventry.

DERBY.—Tuberculosis dispensary, extensions to sanatorium, etc.; Mr. J. Ward, Surveyor, Town Hall, Derby.

DONCASTER.—Liberal club (2,500); Messrs. Garide & Pennington, architects, 24, Wesley-street, Castleford; Messrs. Dennis, Gill, & Sons, builders, Nether Hall-road, Doncaster.

DUNDEE.—Training college (26,000); Messrs. J. Hinny & Co., builders, Rosefield-street, Dundee.

EASTBOURNE.—Additions to offices, Grove Hall (674); Mr. M. Hookham, builder, Springfield-road, Eastbourne. The following plans have been passed:—Additions and alterations, 23, Langney-road, for Trustees of Y.M.C.A.; Mr. S. G. Seales, architect, additions.

"MAIRA HOUSE," Carlisle-road, for Mr. C. B. Ingham; Messrs. G. Bainbridge & Son, builders. Four houses, Hampden-avenue, Hampden Park; Mr. W. R. Box, architect; Mr. Lizard, builder. Additions to school, Green-street, for Managers, St. Mary's Boys' School; Messrs. William Newman & Sons, builders.

Queenborough (Kent).—Offices and tile works; Mr. W. L. Grant, architect, High-street, Sittingbourne; Mr. L. Seager, builder, London-road, Sittingbourne.

Kayne (Aberdeenshire).—Extensions to public schools (2,100L); Messrs. D. & J. R. MacMillan, architects, 105, Crown-street, Aberdeen.

Redcar.—Court-house (1,200L); Messrs. King & Sons, builders, King's-road, North Ormesby.

Salford.—Electric theatre, Trafford-road, for the proprietors. Alterations to workhouse, Eccles New-road; Clerk, Guardians' Offices, Salford. Alterations and additions to Town Hall (2,042L); Messrs. J. Gerrard & Sons, Ltd., builders, 1, Church-street, Salford. Conveniences, Hope Schools, Eccles Old-road, Pendleton, and 329, Great Cheetham-street East, Broughton; Mr. Joseph Corbett, Engineer, Town Hall, Salford.

Seaton.—Church institute (2,500L); Mr. W. Gush, Manor Office, Seaton.

Sedgefield.—Additions to workhouse; Mr. J. Stones, Surveyor, Council Offices, Sedgefield.

Sheffield.—Extensions at the Neepsed Power Station (6,750L); Messrs. Abbott & Bannister, builders, 132 and 134, Machon-bank, Sheffield.

Sunderland.—Hospital (5,000L); Messrs. W. & T. R. Milburn, Fawcett-street, Sunderland.

Swindon.—Church hall (2,000L); Messrs. Bishop & Fisher, architects, Regent-circus, Swindon.

Tophill (Portland).—School (500 places); Mr. T. Brett, County Offices, Dorchester.

Torquay.—House, Barton (640L); Mr. F. G. Moore, architect, 9, Fleet-street, Torquay; Messrs. R. P. Yeo & Sons, builders, 35, Torwood-street, Torquay.

Troon.—Church corner of St. Meddins-street and the South Beach (6,800L); Messrs. Clifford & Lunan, architects, Glasgow.

Wednesbury.—Extensions to public buildings, Education offices and baths (6,500L); Messrs. Guest and Sons, builders, Amblecote, Stourbridge.

Wellingborough.—Alterations and extensions to Park-street School (4,713L); Messrs. E. Brown & Sons, Ltd., builders, Castle-street, Wellingborough.

Westhoughton.—School off Bolton-road (9,200L); Dr. H. L. Snape, County Hall, Lancaster.

Whitley Bay.—School (11,000L); Mr. G. T. Forrest, architect, Moot Hall, Newcastle; Mr. J. F. Newbould, builder, Tynemouth-road, North Shields.

Wigginton (Herts).—Alterations and additions to Church of England School; Mr. Huckvale, architect, Tring; Mr. G. Rowe, builder, Wigginton.

Wolverhampton.—Extensions to workshops at car depot (5,850L); Mr. G. Green, Engineer, Town Hall, Wolverhampton.

Yorkshire (East Riding).—Schools, Cottingham (3,692L) and Howdon (2,878L); Mr. J. T. Levitt, builder, 84, Holderness-road, Hull.

Yorkshire (North Riding).—Tuberculosis hospital and extensions to asylum (1,185L); Mr. W. Birch, builder, Barbican-road, York.

QUESTIONS IN PARLIAMENT.

In the House of Commons, Mr. Nannetti asked the President of the Board of Trade whether the building of the Labour Exchange offices in Dublin have yet been commenced; if not, what is the cause of the delay; and will he speed on the building of these long-delayed premises? Mr. Robertson, in a written reply, stated that he was informed by the Irish Department of Public Works that the plans of the permanent building for the Irish Divisional Office and Dublin Labour Exchange have been completed, and that tenders for the building will probably be called for in the course of a few days. As he had already informed the hon. member, the building is being erected by the owners of the site, and not by the Department of Public Works. Difficulties have been experienced in estimating the requirements of the combined Labour Exchange

and Unemployment Insurance staff, which will be housed in the building, but he did not anticipate any further delay.

Captain Jessel asked the First Commissioner of Works if he can state whether funds will permit of permanent pavement being laid down at the bottom of St. James's-street, on that portion under the jurisdiction of the Office of Works, during the recess, in view of the strong representations from the Commissioner of Police and the Westminster City Council? In a written reply, Mr. Wedgwood Benn stated that the First Commissioner intends to carry out this work at an early date.

LONDON COUNCILS.

Barnet.—A Committee has been appointed to consider the question of town planning and to report thereon. The respective merits of paving with tarred stone and tar-paving were reported on by the Surveyor, and it was decided to tar-spray Wood-street at an estimated cost of 50L when a favourable opportunity occurred. Tenders are to be invited for demolishing the old Barnet Brewery. The question of the preparation of a scheme for dealing with the site is to be dealt with prior to advertising for architects' plans for the erection of new Council offices. Fresh tenders are to be invited for erecting twenty-two workmen's cottages, Tottenham-lane. The following plans have been passed:—Mr. E. G. W. Dawker, additions to the Old Ford Manor Golf Club House; Mr. T. Cude, six houses, Normandy-avenue; Mr. J. Hardy, motor garage, Oakhill, Bells-hill. A plan has been lodged by Mr. A. M. Ingham, for additions to the Constitutional Club.

Bethnal Green.—Dr. George Padlock Bates, in his annual Report on the sanitary condition and vital statistics of Bethnal Green which has just been issued, states that he had found since he last made a systematic house-to-house inspection under the Housing, Town-Planning, etc., Act, 1909, in the Digby-street district, that a large amount of repair work, including in many instances actual rebuilding, had been carried out, the chief defective portions remaining being a large block of back-to-back houses in Digby-street and Digby-walk, and the aged and worn-out condition of a number of other houses. On consideration he was not very hopeful that a new representation would be more successful than the previous one, but as a rehousing scheme for this district would give an opportunity for carrying out a much-needed public improvement, namely, the widening of Green-street, he requested the Public Health Committee to view the area with him. As the result of such visit it was decided to serve full notices under the Act of 1909, where necessary, and to exert pressure upon the owners of property to carry out extensive repairs. Ninety notices under sect. 15 were served with the result that a large amount of work had been carried out; most of the defective houses had been thoroughly stripped, walls and woodwork repaired, and afterwards papered and painted throughout. Nine old houses at the corner of Baker-street and Green-street had been pulled down. He regretted that, notwithstanding the strenuous efforts of the officers of the Public Health Department, the Brady-street district had steadily deteriorated since his last house-to-house inspection in 1904, prior to a representation of the area under the old Housing Act.

Finchley.—Negotiations have been going on for some time past between the District Council and the County Council re widenings in Great North-road, Ballards-lane, Regent's Park-road, and Woodhouse-road, and the District Council have now put forward proposals under Clause 37 of the County of Middlesex Light Railways Order, 1903. These proposals briefly are that the District Council is to be empowered to spend upon the carriageways up to 59,000L, and on the footpaths up to 11,655L, that the County Council is to pay such proportion of the cost (not less than half of the actual expenditure) as they pay to other districts in the county; also that the County Council is to make a contribution of a moiety of 3,000L. The District Council have passed plans for the new church of St. Barnabas, North Finchley.

Friern Barnet.—Plans and estimates by the Surveyor for the erection of fifteen workmen's dwellings in Sydney-road, at a cost of 3,150L, have been approved.

Hornsey.—The Fire Brigade Committee, reporting on a new fire brigade scheme, recommended that a firehold site fronting Fortis Green be purchased for 920L, and that a fire station with station-officer's residence and separate residential quarters for five firemen should be erected thereon, at an estimated cost of 5,610L. Alterations were also proposed at

the Central and South Harrington at a cost of 170L, and 420L. Alderman Grayson said it would be to build a fire station such as at Muswell-hill at less cost than that. The Committee had already blocked 2,000L by having a separate block of men's dwellings. Alderman Sloane said the old station might be used as a branch library, or the Electricity might like to make certain developments. Committee's recommendations were. Additional office accommodation provided at the Electricity Works at a cost of 150L. The tender of Messrs. Griffiths & Co. has been accepted making up the passage-way at Royal-parade, Colney Hatch-lane. Plans have been passed:—Archer, 101, Queen Victoria-Salvation Army hall, Tottenham; C. J. Halsey, alterations and additions, 416, Archway-road, Highgate; Baily, Park-road, alterations and additions, "Ellendale," Crescent-road, Crouch End; Frank Bethell, Knifield, shop and way-road, Highgate; Mr. Frank hope-road, alterations and additions, Crescent-road, Crouch End; Messrs. Samuel & Co., Ltd., Park-avenue, alterations and additions to No. 1, Mr. Edward White, dress-maker, at No. 14, North-road, Highgate, has been lodged by Messrs. W. & Sons, for alterations and additions, Queen's-parade, Muswell Hill-road.

Richmond.—Application is to be made to the Local Government Board for a loan of 918L, for improvement of Sheen-road and Warple-way. A plan has been sanctioned by the Local Board for the extension of the L. and the Surveyor has been instructed to prepare detailed plans and specifications for the purpose of the work being put in hand. The Street Improvement Committee have approved plans for three shops and a garage proposed to be erected on Nos. 1 and 2, George-street. Plans passed for Messrs. Boore & Partners, erection of three houses in North-street. The Urban District Council at their next meeting in September consider a proposal to purchase D. Watford.

FOREIGN AND COLONIAL.

Cement Trade of Dalmatia.

Mr. Vice Consul Lucas-Shadwell on the trade of Dalmatia (Austria) states that there are four cement works in Dalmatia situated at or near Spalato, which have suffered severely from the acute crisis through which the cement industry passed, the Dalmatian are now, thanks to the "combine" they are associated with the other cement factories, doing satisfactorily. In 1911 the Dalmatian works produced 1,000,000 metric tons of cement, while the port, according to the official figures, the latest available, was 8,000 tons; in 1911 a much larger quantity have been exported. Dalmatian cement is shipped to Trieste and to the Austrian coast, and also to Turkey, Argentina, Brazil, India, Vessels of the Austro-American Line at Spalato to load cement for American ports.

Building in New Zealand.

The issue of New Zealand's Commerce of June 14 states that the erection of the new building of a Wellington firm has been completed. The new building is a branch of the Bank of New Zealand. The building will be constructed of reinforced concrete, with concrete roof, and a lift will be provided for floors, which will be let out as offices. The successful tenders were made known by the architects on application to the Intelligence Branch of the Board of Works, Basinghall-street, London, E.C.

Building and Paving Material.

The *Diario Oficial* of June 13 contains text of a Bill under the terms of which the President of the Republic is authorized to contract, on behalf of the Municipality of Concepcion, a loan amounting to 1,000,000 pesos, not exceeding 500,000 pesos annually, for the purpose of erecting buildings, and also for the improvement and lengthening of streets, and squares in Concepcion.

BAAPTIST CHURCH, ELTHAM PARK, KENT.

Building has recently been completed at £100,000. It occupies an elevated site at the corner of West Mount-road and Glenure-avenue. The original design (as it appeared at the Royal Academy Exhibition of 1905) included a massive tower, but sufficient ground was not forthcoming to erect this. The design, as carried out, is marked by simple lines, harmonious colour tones, and fine materials. The walling is in "red" bricks showing pleasing variety of pattern. The stone dressings and window sills are from Ridge Park, Corsham. The roof is covered with rustic tiles. Internally the nave is covered with rough plaster, the roof is lined with light brown solignum, the choir is merely flat-varnished, the iron-work of the chancel and lobbies in terrazzo. The seating, pulpit, and wall panels are in Canadian oak slightly darkened and wax-polished. The choir is in white marble and tiles. The steps are in white Mansfield stone. The chancel and lobbies in terrazzo. The vestries have wood-block floors. The windows have leaded glazing, with decorative tracery of Norman slabs, etc. There is a gallery constructed of ferro-concrete, the nave arcade and pillars. Four hundred and fifty sittings are provided, and the

church is capable of future enlargement by extending the aisles, which at present are merely ambulatories. There are three spacious vestries and two sets of lavatories. Heating throughout by low pressure hot-water apparatus. Lighting by electricity with holophane fittings. Ventilation on the "Natural" system, with wall inlet panels (besides window-casements) and roof extractors. The general contractors were Messrs. J. Garrett & Son, of Balham-hill, S.W. The architects were Messrs. John Wills & Sons, of Derby and London.

PATENTS.

APPLICATIONS PUBLISHED.*

- 17,223 of 1911.—John Wilson: Apparatus for use in building concrete structures.
- 18,053 of 1911.—Heinrich Korrodi: Light indicator for doors.

PATENTS—continued from page 215.

of studs and slabs of the same height as the stories wherein the floors and roof are cast in situ, the reinforcements being secured to hooks or eyes *g*, cast in the slabs. Corbels or rabbets are provided under the edge of the floors, and the door and window openings are formed in the slabs. The slabs are tongued and grooved on the square or bevelled vertical edges.

5,508 of 1911.—Gerald Otley Case: Reinforced concrete constructions.

This relates to skeletons as used in reinforced concrete constructions which consist of wooden lattice girders in flat or box form, the

5,508 of 1911.

diagonals being made of wood or metal. The frame consists of two longitudinal wooden bars *a*, and diagonal metal dogs *b*; the lower bar may be strengthened by combining with it the trussed bar *c*. A continuous bar may be used instead of the separate dogs.

6,500 of 1911.—John Murray Leighton: Piles. This relates to preparatory hollow piles which are made with no internal projections, the driving-shoulder which bears on the driving-shoe being formed by enlarging the bore of the tube, or a sleeve on the tube,

6,500 of 1911.

internally, and bringing it to a sharp lower edge. A sleeve *b* on the tube *a* is internally enlarged to form a shoulder *c* for the point *e*, and has a conical portion *d* which provides a comparatively sharp edge. The shoulder is not always square, a curved driving-face being sometimes used.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has been specially asked for them. All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the Editor, or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premised Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

IMMINGHAM

DEEP WATER DOCK

OFFICIALLY OPENED BY THE KING, JULY 22nd, 1912.

POINTS OF MERIT:

Favourable Situation.

Immingham Dock is geographically the most central coal port for the Continent, and is in direct rail communication with the great coalfields of the West Riding and South Yorkshire, Derbyshire, Nottinghamshire, &c.

Most Modern Equipment.

Immingham Dock has eight coal hoists capable of shipping 5,600 tons per hour. Largest ships can bunker at deep water jetty—only ten miles from the open sea—at any time of the day or night. Storage accommodation is provided for 11,600 loaded wagons, and there are 170 miles of sidings. Every precaution taken to minimise breakage of coal. Movable hoist enables two "holds" of a vessel to be loaded simultaneously.

Always Accessible.

Immingham Dock has a storm-protected harbour and deep water channel and entrance lock, enabling the largest ships to enter and leave at any state of the tide.

Low Dock Charges.

Immingham Dock charges are more favourable than at any competitive port.

For Information apply Great Central Goods Agents or Port Master, Immingham Dock, Grimsby.

Strated Brochure "3" and Map "3," printed in English, French or German, post free from G.C.R. Publicity Office, 216, Marylebone Road, London, N.W.

COSMOPOLITANISM AND ARCHITECTURE.

THE present is an age of intercommunication with closely-woven yet far-extended interests, of a pattern so complex that it is difficult to unravel a sequence of events so as to determine how much is only to ourselves as distinct from what is rightly the portion of others.

It is tempting to trace out the causes which have helped to shape a Nation's ways interesting and instructive. It is an imitative animal, and, while it is in a great measure the example of others who have preceded him, he is open to other influences which may direct his works. Tradition, that the word signifies, is only the causes which go to the formation of architecture.

The small and isolated communities of the Middle Ages local interests were of no account importance, and inherited from the main source of inspiration, the crafts of a handicraft or trade passed on from father to son; for the personal factor, which, in its shapes, is not only to a large extent absorbed in the work of the individual which it helps to produce, but is in a great measure, responsible for its distinctive character. We can see the results of continuity of effect which its process could give. Mediaeval architecture the result of the conditions under

which those who produced it lived—conditions which were constantly changing and at last ceased to exist.

In the freer life of the Renaissance there is apparent a broadening of boundaries, and with a fuller knowledge; a breaking down of the old local customs; travel and communication with other countries resulted in an exchange of thought, which directly affected the art of the time. It is to be doubted if architecture ever has been a purely parochial or national affair. Even in Gothic periods there appears to have been an interchange of ideas, a reflection of the art of one country in the works of another, and from the end of the XVIth century up to the present day this influence has become more manifest.

All countries have, at one period or another, borrowed from their neighbours, and though, for the most part, these borrowings have been marked by a transition of form which has modified and rendered the adaptation to a large extent national, the sources of their inspiration can, in most cases, be definitely traced, and in a great measure this very quality has been due more to an imperfect comprehension than to any particular desire of the artist to achieve a definite style. The point is that what is peculiar to the art of a country, even when derived through foreign channels, is the result of a natural process and cannot be attained by any conscious striving. What is

national in the best sense comes unconsciously, as it were, in spite of ourselves; it is an intangible manifestation of our collective character which escapes all attempt at limitation or direction.

The question as to whether in our effort to build up a great city on a public architecture the study of foreign styles is to be rejected or pursued has of late become a subject of anxious inquiry; the dreadful fear of becoming un-English, of losing our national inheritance, would appear to some to be the grounds for seeking a salvation in a splendid isolation.

To be ignorant of our own history is not a good preparation for the sympathetic understanding of the history of other people; while to shut ourselves definitely off from all outside influence is not only in these days impossible in point of fact, but would be productive of a barrenness inimicable to that broad culture which is the best preparation for the study of the arts. Of architecture in particular, it may be said that it has always depended for vitality and continuity on the constant absorption of new ideas.

To-day increased facilities for travel, the multiplication of fine books, and the art of the camera have made us familiar with life in its various aspects in all parts of the world. In commerce and finance our interests may be described as international; in habits and modes of living we tend to become more cosmopolitan—

a change of life, the result of which is becoming increasingly apparent in our buildings.

Now this cosmopolitan aspect of art is not without its dangers. To admire what is best in European or American architecture, and to seek to reproduce it, is not only natural, but almost inevitable; the danger lies in a superficiality of appreciation, the skimming of the cream from the surface, without any attempt to understand the underlying root-principles.

Enthusiasm alone with no faculty for penetrative criticism can only be productive of the most unfortunate results. The untrained mind is always open to attraction by extravagances and non-essentials; the real essence of a movement nearly always escapes it; the undisciplined are always the first to follow the passing fashion of the hour. A great deal of the best European and American architecture is based on a common classical inheritance, and to be well grounded in the fundamentals of this is the best preparation for that complete understanding which accepts only what is most necessary to growth and development.

To be academic in the broad meaning of the word is to have a standard by which all is tried; it is to be able to determine what is of real and lasting importance as distinct from that which is only temporary and evanescent. Several of the most recent large buildings in London show a strong French influence; in fact, some of the best of them are directly due to the inspiration of France, that land of Academies, pregnant with the spirit of critical discrimination. Such work at its best will stand the test of time, but contemporary with it there is unfortunately much that, masquerading under the same cloak, is trivial and meaningless, that has no depth or permanence and has very little real intrinsic value.

Ever since the waning of the Gothic revival we have had a continuous succession of styles derived from English and Continental models alike, all held up as examples for our instruction and imitation. Judging by recent indications, we are about to surrender ourselves to the sway of America.

Amidst all the confusion caused by our haphazard method of choosing our different models it is difficult to find any logical sequence in their acceptance or rejection. We have passed from one to another without apparently any greater reason than that dictated by the whim of the moment, the mode set by some particular exponent, or the opportune publication of some important book. To make things worse, we have not always based our work on the best examples. Ignorance, the brother of opportunism, has helped to plunge us deeper into the mire. We do not learn French or German in order to forget our English, but in order to enlarge our ideas; not that we may sprinkle our conversation with appropriate gleanings from other tongues, but that we may be richer in a fuller knowledge of their literature.

So with architecture, what we study we need to assimilate; seeking after what is the best we must wrest from it what

is most essential to our needs. We must dig deep down to the base of things; experience prepared by education is the true path of learning.

It must be remembered that our building exploits are now judged by the whole world, that we now act on a wider stage and to a larger and more critical audience than we have ever before been called upon to face. No sooner is a building erected in London than the elements of its design are known in Paris and New York. That is to say, if the design and construction are likely to interest our brothers in Paris and New York. A greater publicity entails a greater responsibility; what was good enough for the village years ago will not pass in the metropolis to-day, much less in that extended circle that now demands our attention.

As cosmopolitanism in life affects our manners and mode of living, so in art some adjustment of prevailing standards is necessary. Not less, but more, is required of us, and indications are not wanting that we are alive to this, and are seriously preparing ourselves for our fuller opportunities, that a future rich in promise may also be one of fruition and fulfilment.

LEGISLATION AND THE EXPORTATION OF WORKS OF ART.

FROM time to time alarms are raised in the Press because some valuable antiquity is on the point of being sold to America. Whether it be picture, fire-places, or panelling, or, indeed, a whole antique fabric, the same resentment is expressed against the seller for doing on a great scale what we all do on a small one. And it has been suggested that legislation is necessary and right to prevent the continuance of what bids fair to become an extensive form of traffic. Until recently prohibitive tariffs prevented a too great indulgence in this buying of pictures and other priceless things for importation into the United States. These tariffs are removed, and a great barrier is thus laid low which formerly proved practically impenetrable.

Legislation to-day prevents the exportation of objects of art from Italy. Can legislation be devised on similar lines for us? There is a marked difference, however, in the position of the two countries with regard to works of art. Italy claims the work as indigenous, whilst we can make no stand, on patriotic grounds at least, to prevent the sale of such pictures as have been the cause lately of much heartburning. For before the advent of the "almighty dollar" was not the British guinea all-powerful for two centuries or so? The majority of our pictures came from Italy, where they were purchased by amateurs and dilettanti.

Can it, with any justice, be forbidden their present owners, by purchase or inheritance, to sell them to the highest bidder? We think not, not in equity, not on patriotic grounds, for we have no national right in them.

The case is different, however, with indigenous works of art—painting,

architecture, and suchlike. Our cannot be bodily removed to nor their priceless contents of m and stained glass, nor any of the fittings they possess. Our too, are almost as safe. A n or some old panelling may go, that really matter? We allow cious cathedrals to be restore recognition, or take no care of less important, legacies of the and it is only when some a attempts to negotiate a sale v American millionaire that an is made.

The truth is, it is only a price. We allow our pain Reynolds, Gainsborough, and to change hands how they like, they like, because, forsooth, it is of a few thousand pounds. T in which we have some nation things which belong like step ladder of our evolution, may where they will. Patriotism v out a better case for not allow national treasures to be tak And when patriotism does aw of its sloth and sees with open beauty of its heritage, it will fi to keep them. In the mean sale will go on, and so long w this country languish. For th more absurd or foolish belief th died long ago, and, judging fr of encouragement it receives t must assume it to be general. Solomon's time there were pe regretted the good old days!

It is the easiest matter in the learn the names of some of the art, and to unlimited wealth, acquire examples of their wor for lesser means to purchase reproductions of them.

There is no criterion beyond or a fabulous price. There is picture in the Glasgow Ce Gallerie attributed to Giorgione "Christ and the Woman in Adultery." The faltering of the gentle attitude of Christ, satisfied looks of the witnessing are combined in a faultless cor A certain Venetian sumptuous colour and suavity to the dres the figures, and out behind t view of green hills dotted w ineffably peaceful and beautif the picture, being one whose aut is doubtful, it is valued at a f the amount it could be sold judges unanimously considered by Giorgione. It is the lack which deprives it of its value real value, for no artist we H talked to about this picture buy it one of the great achievement but the fictitious one of price.

No more feeble subterfuge is than to deprecate modern art more likely to stifle what, is an extremely sensitive does not flourish in the mind of but weeds spring up, gross which are mistaken by the for flowers. Comparisons sh be instituted between old or m any more than between G Gothic architecture. Their different, but who will say wh brilliance of Manet is less beau

emnity and dignity of Titian. Art becomes a vital thing, a thing that is part and parcel of life, legislation unnecessary to keep art treasures in country.

NOTES.

We are glad to learn from the publication of particularities of the competitions to be inaugurated in connexion with the newly-founded School of Architecture at Rome that this important scheme is a step towards the realisation. Scholarships of the value of 200*l.* per annum and tenable for three years will be awarded in sculpture, painting, and sculpture. The first competition will be made up of a series of tests or competitions conducted as regards the final position *en loge*, in London, on lines similar to those favoured for many years by the Beaux-Arts in Paris. The scheme promises to have a wide and wholesome influence on the instruction of architectural education, and consequently of the raising of the standard of architectural design and the work of the architect in this country—we hope to dwell upon it from time to time, and in a forthcoming issue to give information than space allows. We note, however, that it is the intention of the authorities to make arrangements whereby the results of design for the first stage competition will be made known to "to enable students in the schools to have the same time for preparation of their designs as the students at home." We are further glad to announce that the Jarvis Scholarship, which will also be worth 200*l.* per annum, but be tenable for three years only, will be awarded on the basis of the same competition. Wherever the "Scholarship" will be open to British subject under the age of 21 years, the "Jarvis" will be open to students and Associates of the Royal Institute of British Architects under the same age limit.

Art Training. The question of State-aided art training is in the air once more. In connexion with that subject, delivered at the annual meeting of the National Association of Art Masters, Mr. Reginald P.R.I.B.A., A.R.A., spoke very strongly of the failure of that training, which he attributed partly to general conditions unfavourable to art and partly to want of clear and single purpose in the State art schools. Since the *Times* has published two articles from Mr. Alan S. Cole and Mr. Crane respectively, the first dealing with the accuracy of statistics and the second with the quality of work produced in the schools and the enormous progress

made therein in recent years. We do not question the correctness of the statements and the soundness of the views expressed in these letters; and yet we think they do not touch the substantial justice of Mr. Blomfield's criticism. The remedies suggested by him also are all for good, so far as they go. No doubt if the production of really competent artists and craftsmen be the object of national art training much might be done by the Education Board in the way of making the present system of art schools more efficient to that end, and to the elimination of the unfit and the amateur. But we feel this only touches one part of the question. It does nothing for the general art education of those whose interest therein is receptive rather than executive, or for the arousal of that public aesthetic interest which is so necessary if the true artist and craftsman, when trained, is to find appreciation of his work—and a living. The real trouble now is in the "general conditions unfavourable to art," as one result of which art is regarded as a costly exotic, a luxury for the wealthy connoisseur and collector rather than as a normal condition of completely healthy life in industry. The problem is to reintegrate aesthetic and utilitarian values in their right relation, judged by a higher standard than pecuniary value. It is in fact the great problem of the co-ordination and correspondence of all education, and of art, with industry, and that problem can only be practically approached gradually and from many different standpoints.

Immediate Steps Possible. In addition to the improvement of the schools on lines suggested by Mr. Blomfield, we suggest other immediate steps might be taken in the direction of attracting and encouraging the right students and of awakening public interest in the work being done in the schools, to which so highly competent a judge as Mr. Walter Crane gives such high praise. What prevents the annual exhibition of students' work from being held in those spacious halls of South Kensington, or, better still, in the City? In another letter to the *Times* Mr. Harry J. Powell makes the suggestion that the Royal Academy might include in the Winter Exhibition selected designs of students and actual specimens of industrial applied art, as an effort to bring the public into closer touch with designer, craftsman, and producer. At present the prize works of the schools are contemptuously housed in temporary and inconvenient buildings and sheds. Imagine such a treatment of national competitive art in old Athens, in the great days of the Renaissance, or in modern Paris! Even enthusiastic little parish art societies will choose the best available hall for their shows, and the neighbours will flock to criticise the works and praise the artists. We do not want the amateur without imaginative or executive capacity, but we do want to attract, select, and encourage all those who have real, perhaps latent, potentialities for art. As public interest awakens to the practical importance of this question other things

will become practicable; even, as Mr. Crane suggests, a separate Department for Art and a Museums Board, correlated possibly, we would add, to the general Board of Education on the one hand and to a great Department for Industry on the other.

The Recent Celluloid Fire.

In view of the great importance of this case as an illustration of the extreme danger of storing and working celluloid in ordinary London buildings, we are pleased to see that the *Medical Press* has made some rather strong comments upon the apparently apathetic attitude of the Home Office towards the subject. We agree with that journal in feeling strongly that this case ought not to pass by as a mere nine days' wonder, and therefore, although we dealt with it at some length on the 9th inst., we again refer to it with the special object of emphasising, so far as we are able, some of the very pertinent remarks of Dr. Waldo, the City Coroner, in his thoughtful address to the jury. It must be borne in mind that Dr. Waldo speaks with especial authority, for, as he told the jury, he has, since the Queen Victoria-street (celluloid) fire in 1902, held nineteen (it is now twenty) inquests on as many victims (eighteen of them young girls) of celluloid fires, besides many more inquiries as to non-fatal celluloid fires held under the unique powers of the City of London Fire Inquests Act, 1888, which include powers to inquire into the origin and prevention of like fires in future. Dr. Waldo drew attention to the fact that after holding inquests on two celluloid fires in St. Paul's Churchyard the jury and the City Corporation had asked the Home Secretary to legislate, but without result. He also noted that, even after this latest disaster, the official argument in evidence was, apparently, that there had not yet been a sufficient number of deaths caused by celluloid to warrant the introduction of special legislation against its use and storage in towns—an argument which ignores the all-important question of prevention. Finally, we recall Dr. Waldo's statement that he thought the jury would agree with him in feeling that the time had now arrived for the responsible authority—the Home Office—to act. We would merely add to this that probably, under existing circumstances, an independent inquiry, apart from the Home Office, and followed by prompt action, would be more satisfactory to the workers in celluloid whose fears have, not unnaturally, been aroused by recent events.

LONDON SESSIONS HOUSES.

Pending the demolition of the old building and the erection of the new one for the amalgamation of the North and South London Sessions, the business will be carried on in the old Clerkenwell Court House, which will then be pulled down. The cost of the new Sessions House is approximately estimated at 100,000*l.* This will disappear, says the *Morning Post*, two buildings of considerable historic interest, both associated with the rude justice of the early part of last century. Newington Sessions House was built on the site of Horsemonger-lane Gaol, formerly the prison and place of execution for the County of Surrey. The land, which was originally purchased from a market gardener, is 3½ acres in extent. The Sessions House, originally constructed in 1799, was rebuilt in 1873.

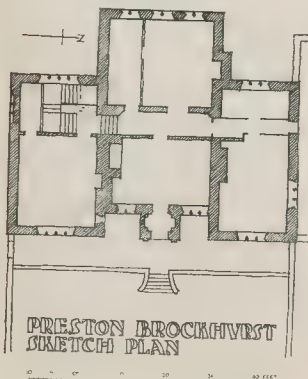

FORTY-THIRD ANNUAL EXCURSION, AUGUST 12 TO 17: SHREWSBURY AND DISTRICT.

THOUGH previously visited by the Architectural Association over twenty years ago, Shrewsbury provided both the occasion and opportunity for an almost entirely different programme this year, rendered possible by the extreme wealth of interest of the surrounding country, and desirable owing to the presence of a goodly sprinkling of members who had attended the previous excursion to this district in 1891.

The county has always occupied a position of some importance since civilisation in England began. It had at least one important Roman station—Uriconium—of which considerable remains have been found. During the Middle Ages, when the Welsh boundary was a frontier, the command of the Border districts, or Welsh Marches, was esteemed valuable, and the neighbourhood was studded with castles and defensible manor houses held by various noble families. With the coming of the Tudors and more peaceful times the noble families remained, beating their swords into ploughshares and converting their castles into peaceful dwellings. It is to this era that the more interesting of the buildings belong, and, owing to the great prosperity of the county during the reign of Elizabeth, their number is very large. The variety of material at hand prevented the development of any markedly local manner; stone, brick, and half-timber construction are about equally common—domestic buildings in the latter method being usually the earlier—and good specimens of each type were included in the programme, though some of the best were notably absent owing to previous visitation, as, for instance, Conover Hall.

The majority of the party assembled on Saturday evening previous to the official commencement of the programme on Monday, August 12, and with accessions of strength during the day devoted a showery Sunday morning to a preliminary inspection of the town, of which

MORETON COR...

detailed examination was reserved for Saturday following. In the afternoon a party visited Buildwas and Much Wenlock.

First Day—Monday.

Owing to the proved convenience and adaptability of motor transit in its limited application of the previous year, the Secretaries had adopted it to a much larger extent on this occasion, and on Monday the programme, consisting of five items traversing a distance of over twenty miles, was so arranged as to leave an eight-hour working day clear of travelling time.

The first place visited was Allbright Hussey, about three miles north of Shrewsbury, where the Manor Farm shows interesting fragments of two successive building schemes, each appearing to be part of a larger house. The manor belonged first to the Husseys and afterwards to the Corbets, both names recurring again and again throughout the records of the district. The earlier part of the existing house is a richly-detailed timber-framed building of 1524, its most striking feature having been apparently an entrance porch, now badly mutilated and shorn of its original gable (or perhaps upper story). It shows local characteristics in the twisted shafts attached to the main posts of the framing and the repetition of sunk quatrefoils on the fascia and other horizontal members. A fine shafted chimney of six flues rises to the right of the entrance. The rooms in this portion of the house have moulded beam ceilings and unmixed oak panelling. The second portion is a brick and stone building of 1560, bolder in scale and with loftier stories than the timber building. A fine room on the ground floor of this portion has mitred panelling and a characteristic chimneypiece. An inscription declares the panelling "made by Edward Huse, 1601."

A further distance of about five and a half miles brought the party to Grinshill, where are situated the quarries from whence much

of the local stone was, and is still used. Here a brief visit was paid to the Moreton Corbet district as an example of the vernacular manor of the Renaissance period. The front, of good masonry, of very large stones, has a recessed entrance between two large projections, but the recess has been built up and a tiny central gable built into the two wings, giving a very odd effect. The windows—mullioned and transomed—plain played order, with an extra pane in the opening—are placed without regard to the centre lines save those actually in the gable, and the proportions are rather heavy on centres of mullions, which are 6 in. wide, leaving very little glass in the openings.

A short ride onwards, and Preston Hall was reached. This proved a most interesting house, with its surrounding buildings in some degree of order. The original hall formed part of the house of the heiress of Bartholomew Turret, who was married to Sir Richard Corbet, of Caus Castle. The house was purchased by the Civil War, and the heavy fines imposed by the Parliament, the family were obliged to sell the property, and the present hall is the work of Mr. Wingfield, of Shrewsbury, who pulled down the old house and built a hall of freestone, using no doubt the material as far as it would serve. The house returned to descendants of the owners, and the raven badge of the house now surmounts the porch.

It is an interesting example of the vernacular of West-Country building of the Commonwealth. Although its front is symmetrical (see sketch plan), it is not so, the right-hand gable being narrower than the left, but rising to the same level as the left. The plain mullioned and transomed windows might be 100 years earlier, but the panelling is solely used everywhere for

PORCH AT
MADELEY COURT.

and chimney bases indiscriminately. The two-storied porch curiously overhangs corbelling above the ground story, and below the coarsely-balustered shafts. Two good chimney-stacks of the type are well placed on the main ridge; three circular shafts, rises on the wall and displays a curious feature, by an early device akin to the modern light-preventing pot. The Hall stands on rising ground looking east towards the village, and is helped in appearance by a walled forecourt with two fine gate piers and an inner terrace with central steps. The stable and granary to the north are contemporary with the house, and the former shows good detail. Really there is a good deal of interest in the house, though chiefly of later date than its original construction. Some amount of rearrangement appears to have taken place in the early XVIIIth century, and at the time the main staircase, with twisted balustrade, and some good bolection mouldings, probably date. The earlier staircase is above the first floor, and a portion of the tower flight has apparently been reused in the present arrangement. The weather, though none too promising, has far remained kind, and a wayside as here partaken of before proceeding to Moreton Corbet. Here the ruins of the tower houses are to be seen, so fragmentary that it is difficult to piece them together. Apparently the mediæval castle (of which parts appear to date from the XIIIth century) was partly modernised in the XVIth century. Over its main portal, in which the portcullis may be seen, is inserted with the date, 1579, and initials S. A. C., a fragment of a window of about the same date. On the south side of the castle stands the shell of one wing of a building, which, had it been completed, must

have taken rank with the finest of Jacobean work. Camden records that "Robert Corbet, carried away with the affectionate delight of architecture, began to build in a baroque place, a most gorgeous and stately house after the Italian model." This was pushed on through the first part of the XVIIth century, but remained incomplete at the time of the Civil War, when it was garrisoned first for the King and then for the Parliament, and irretrievably damaged. As so frequently happens in similar case, Robert Corbet is reputed to have brought the design from Italy. The building, however, abundantly disproves this story—it has no Italian characteristics and displays all the grotesque mannerisms of our own Elizabethan and Jacobean styles. The west end of the new wing shows change of intention which makes it difficult to follow, but the south front is quite intelligible. The facade has a strong base broken only by two relatively small doorways. Above are two stories, each with its pedestal Order of three-quarter columns, Doric below, Ionic above, with enriched entablatures bearing emblems, initials S. A. C., and the raven and elephant-and-castle badges. In the centre and at each end is a slightly projecting bay surmounted by an ogee gable containing a pedimented window. Notwithstanding a fairly correct treatment of the Orders, there is strong mediæval feeling about the carving of finials and panels, and the details generally are of a barbarous character. Moreton Corbet Church, adjoining the castle ruins on the north, embodies fragments of Norman work, but derives its chief character from the south aisle, or Corbet Chapel, added about 1325, and containing two altar tombs with coloured effigies. There is also an interesting Squire's pew of 1778 in the chancel. The tower, built in 1539 by bequest of James Janyns, Clerk, with an upper stage in the Gothic of 1769, shows characteristic detail in the spandrels of the western doorway, delicately carved with

ribbon-like foliage and the royal arms, a Tudor rose and fleur-de-lis appearing above the label.

Leaving Moreton Corbet, Battlefield Church was visited on the way back to Shrewsbury. As its name suggests, this church was founded on the site of the Battle of Shrewsbury. It was the chapel of a college of priests, and was built on land given by Sir Richard Hussey about 1406. It subsequently became ruinous, and its condition in 1853 is shown by some old drawings in the tower. At that date the western bays were roofless, and the east end, closed in by a wall of which marks yet remain within, was roofed in three narrow spans with four Doric columns supporting a barrel ceiling over the centre aisle. In 1861 the whole was restored by S. Pountney Smith. It is now the Parish Church in place of Allbright Hussey, which was destroyed long previously. The building presents remarkable features. Though the date is well attested, three of the windows are of the ordinary mid-XIVth-century type of reticulated tracery, and, though only a college chapel and hence probably without any structural or other division into nave and chancel, the eastern bays differ in design from the western, which difference has been accentuated by the restoration. The foundations of a part at least of the college remain on the south side, also its attachment to the church. A curious Elizabethan ivy-gate is said to have been brought from Upton Magna, where from internal evidence it apparently served a different purpose—probably a porch.

Second Day—Tuesday.

Threatening weather attended the start, and Wroxeter Church, the first halting-place, was reached in depressing conditions. A plan of this church (as of most of the principal ones of the county) appears in Cranage's new and excellent work on the Churches of Shropshire. It would seem that the north wall of the chancel is Saxon, built of Roman stones, and the bulk of the remainder Norman work of the late XIIth century; but XIIIth-century lancets were inserted in the nave on the north side, and the whole of the south wall dates from 1763, when it was rebuilt after a collapse. The churchwardens' accounts for 1708 disclose items for repairs, including one for "building a Butrice," so that it had apparently been insecure for some time. The chancel arch, of transitional date, has a curious four-centred outline, probably the result of settlement. The nave ceiling is flat and plastered. The most interesting exterior feature is the western tower, built after the dissolution of the monasteries, of stones from Haughmond Abbey, many

Battlefield Church: Wooden Figure of
Virgin and Dead Christ.

of which are worked in in curious positions, but with rather good effect; the general outline and disposition of ornament follows several earlier towers in the district. Internally the chief interest centres on three fine early Renaissance altar tombs on the north and south

sides of the chancel. The more westerly of the two on the north side is particularly fine, and its effigies of Sir Thomas Bromley, C.J., and his wife, temp. 1551, are so excellently carved that the employment of Italian workmen may be suspected. Both this and the later tombs to John Berker of Haughmond (1618) and Sir Richard Newporte (and their wives) are richly coloured. The excavations on the site of Roman Uriconium were not visited, the next place reached after a long ride through hilly country being Shipton Hall in Corvedale. Upon arrival the sun gleamed out and the weather mended, conditions becoming generally more pleasant. This house, of which a sketch is reproduced on one of our plates, is a beautiful example of the latter part of the XVth century, very complete on the entrance front, though internally altered and extended at the rear in the XVIIIth century. It has an E front without the centre limb, the porch being pushed into the angle by the right-hand projection and carried up as a tower two stages above the main eaves. The hall extends the full distance between the wings, but has been refitted internally in Georgian work of probably 1769, which date appears on the rain-water head outside. To the right on entering lie the kitchen and offices, and in the opposite wing a drawing-room with a good Georgian chimney-piece. The room apparently built as a dining-room at the time of the alterations, seems never to have been finished. Above this latter is a fine library with fittings and chimney-piece well detailed and coloured in a scheme of apple-green and white. The stairs present some curious features, scroll brackets of the ordinary outline having a series of tiny interlaced ogee arches above in place of the customary foliage—a sort of Georgian Gothic.

On the first floor is a good deal of original panelling, perhaps refitted from the lower rooms in most cases, but in one small room at the head of the stairs evidently in its original position. This room is very charming and has a frieze and cornice full of piquant detail. There are also examples of good hinges and door furniture of both dates. The house, which belonged to the Mytton family, until recently contained a fine collection of furniture and relics such as accumulates during a long family ownership, but this has been sold and dispersed. It is very fortunate that the alterations which it has undergone show no trace on the entrance front, which, with its walled garden, terrace steps, and fine masonry of small coursed rubble, with upstanding brick chimneys, is typical of the best work of its period. Leaving this house with some reluctance, a short distance over farm roads brought the party to Wilderhope Manor House, a forlorn but lovely building of the late XVth century. It was built or remodelled by Francis Smallman, who died in 1599, and his initials with those of his wife Ellen occur repeatedly on the plaster-work of the ceilings within.

The house remained in the family until the beginning of the XVIIIth century. The plan, which is an interesting one, is given in Vol. II. of Garner and Stratton's work on "Tudor Domestic Architecture." Internally the plaster-work of the Hall ceiling and in other rooms on the ground and first floors is beautiful and uncommon. There is also a good chimney-piece in the hall, and some panelling dated 1672 in a small parlour. It is evidence of the early date or belated style of the house that all the internal partitions are of timber framing with plaster panels, and the main stair is a circular newel stair with solid oak treads. This shows externally as a semicircular turret capped with a low conical roof, and gives a charming character to the north-west front, seen in Mr. Sutton Wood's sketch. The colour of the building is delightful—warm yellowish-grey small rubble uncoursed, tall shafted chimneys of mellow brickwork with diapered bases, lichen-clothed stone slate roof combine in a beautiful picture such as the hand of time alone perfects. The party was again reluctant to leave, but was collected with some difficulty to proceed to Broncroft Castle. Leland describes this as "a very goodly place like a castell, longing to the Earle of Shrewshire," but very little of the fortified house of the XIVth century is incorporated in the present house, which dates almost entirely from 1860. Making a brief stay, during which they were most kindly entertained to tea by Mr. Whitaker, the party then returned through Church Stretton to Shrewsbury, having covered nearly fifty miles of good and bad road during the day.

Third Day—Wednesday.

Threatening weather continued, and the start for the long motor ride to Madeley Court was made under cheerless conditions. Fortunately the rain held off. This one-time fine house has progressed rather beyond the state of picturesque decay and borders on the deplorable, while its surroundings are not inspiring. Originally this was a house of the Prior of Wenlock, and here the last prior was permitted to retire by Henry VIII., who afterwards sold the estate in 1544 to Sir Robert Brooke, Speaker of the House of Commons, and afterwards Chief Justice of Common Pleas. He is recorded to have built the house anew. The almost ruined buildings now standing are obviously the result of the intermittent activity of many years. They consist of a main building, roughly L-shaped, with a large walled garden to the north-west and a forecourt with detached entrance lodge on the south-west, the outer faces of the L fronting north-east and south-east. Evidences appear to show that the plan was originally an E, traces of a wall, with base mould and sills, extending parallel with the existing wing, and a gable-end in the portion which such a wing would adjoin having obviously been rebuilt in later masonry. It may also be conjectured that the first building, in which the hall is situated, was at first lower and without dormers, the great fireplace having been raised on the upper floors on either side of the original chimney. There is now an upper range of lofty stone dormers with curious crocketed finials. The porch, near the angle of the L—seen in the sketch in one of the Plates in this issue—is a grotesque example of Jacobean design, and the detached gatehouse appears to be of the same date; it has an arched entrance flanked by curious octagonal turrets roofed by pyramids well above the main roof, and the approach centres with the flank of the hall porch in which the entrance lies. The internal plan of the house is barely decipherable, but it can be made out that the hall occupied the full width of the centre block, with a circular oak newel staircase in the angle with the wing. The interior has been stripped of most of its interest, but a room on the first floor has a geometrical rib ceiling of early type in which one coat of arms remains, and there is another fine coat with supporters and mantling on the north wall of the hall. The internal partitions are of heavy framing with wattle and plaster panels, as at Wilderhope. A curious astronomical sundial stands in the centre of the garden.

At Shifnal (formerly also called Idsall), the next place visited, is a beautiful and interesting church of which a very full description had been most kindly furnished by the Vicar. Parts of the chancel, transepts, and west wall are of late XIIth-century work, the central tower, was rebuilt, circa 1250, on sturdy arches west of the Norman chancel arch, which remains

intact. The nave and aisles and the south porch and parvise are also of century date. The chancel was left in the early XIVth century, and the chapel is slightly later. The nave and chancel were renewed, after a fire in 1592, with Bethan double-hammer-beam trusses. So much for bare description. The church, with its clearestory wall without windows, lofty dark roofs, is very impressive; vaulted porch, with an inner bay crocketed and carrying the parvise as a right up to the nave arcade, is an feature. Externally the church group fully from many standpoints, perhaps delightful being the south-west view, plain west end without aisle window, delightful composition of the porch staircase are best to be seen. The church is a pleasant little place and contains no quiet buildings.

After Shifnal, Tong was visited. church (like Battlefield) was also a church but was only made so in 1411, when by Dame Elizabeth de Lingen, wife of Fulke de Pembruge. The building is almost entirely of one date—the rebuilding—but it has been pointed out that the south nave arcade shows on the side a label mould with stops of XIIIth century, while the capital of the column is of similar date. As the nave respond is of similar date, it is arguable that this arcade has no label, it is arguable that an earlier nave stood on the site of the present south aisle. This suggests a transeptal church with nave and unaisled choir, but actual central tower, with octagonal base and spire, is unsupported by transept and appear to be such on plan being continuation of the aisles up to the tower. The church is full of old work, the choir stalls and screenwork being indeed, especially the parloise at the south aisle, with lovely running ogee cornice and rail showing oak leaves and a conventionalised stalky plant very be ivy. On the south side of the transept is the Golden chapel, a beautiful building of about 1500, with fan vaulting coloured and gilt (see Plate). On the east of a wooden floor from this chapel a number of some fragments of stained glass of the XIVth century were discovered. There are now in the west window. This is a positive mausoleum of the Vernors as Leland says, "Many or almost all that were famous of them sines the Flood." He adds, "There was an olde Caste

cauld Tunge Castel. Sir Henry Verdon daies made the castel al of brike. It was shown in Buck's view of 1731, but was demolished in 1764 by George Vernon. It is said to have amassed a fortune in the west of Paymaster of the Forces.

designed the rebuilding himself, in a
ended to be Moorish, and the only
which is suggested thereby is a
of the old saw, "A man who is his

ling is so well known and has
often illustrated that any extended
is superfluous. Very complete
drawings by Mr. David Robertson
chief in the Architectural Association
book in 1909. The earliest portion
of the north tower, which may date
ownership of the de Laeys or de Sais,
overhanging timber top story is
much later. The hall probably is
of John de Vernon (1240), except
next the courtyard, which were
1300, and are in worse repair than the
work. The most interesting historical
connected with the house is, however,
ship of Lawrence de Ludlow, to
due to crenellate was issued by
him (1290-1). He must be among the
at we are now accustomed to call
princes," being a Burgess of Ludlow
made a fortune as a cloth merchant,
the Stokesay as a country seat. The
south tower seems to be his work,
with the enclosure walls of the court-
have perished. His descendants held
until 1498, after which it passed to
his son, who owned it until 1600. The
continuously inhabited up to the
century, and, though each generation
the building remains substantially
the XIIIth century. The charming

wood illustrations and a most careful
of its growth, is published in
Churches of Shropshire" already
Notwithstanding its evolutionary
effect is that of a complete work
XVth century, at which date it

was "pulled together." It contains some
beautiful glass (unfortunately much restored),
and the screenwork and stalls of the collegiate
choir are very fine. The roof-screen is re-
markable for the width of its centre opening.
The very lofty central lantern tower, built
between 1453 and 1470, is rather bleak in
detail and inferior to the late towers of Somerset
or Suffolk, but internally its lantern stage gives
a grand effect at the crossing, and from all
points in the surrounding country its great
shaft is a conspicuous and noble feature in the
landscape. The town of Ludlow, mentioned
in "Domesday" as Lude, formerly derived its
importance from the trade in Welsh cloth and
so early as the XIIIth century was gaining
in prosperity so that the original church was
considered too small. In 1232 the creation of
walls and gates was considered, and in 1260
was under way. The formation by Edward IV.
of the Court of the Marches gave a great
impetus to the political importance of the town,
but at the same time rendered it more and
more an appanage of the castle, which became
the chief seat of the Council.

The ruins of the castle buildings, which are
very extensive, present examples of the work
of all periods from the Norman of the original
castle of Roger de Lacy as represented by the
square keep or donjon, the circular nave of the
later Norman chapel built by Joco de
Dinan (temp. Henry I.), the splendid range
of State apartments, along the northern side
of the inner bailey, probably the work of
Roger de Mortimer, down to the later works
of Henry VII., when the castle was occupied
by the Court of Princes Arthur, Elizabethan
repairs of Sir Henry Sydney, Elizabethan
Lord President, in 1591. The chief interest
of the buildings is in their picturesque and archæo-
logical aspects, and only a short time was spent
in their exploration before walking across the
Teme to Ludford in Herefordshire. Here the
Manor House, though picturesque on the side
towards the churchyard, was otherwise dis-
appointing. Neither the church, almshouse,
nor Old Bell Inn tempted a long stay, and a
return was made to Ludlow, the well-known
Feathers Inn being visited for tea. This is
the most elaborate of all the timber fronts
seen, but is less satisfactory than another of
simpler character between Corve-street and
the Butter Cross. It contains, however, some
good panelling and chimneypieces, the large
first-floor room having particularly rich detail
and a plaster ceiling of later type than those
seen previously. Its centre compartment bears
the Royal Arms as also does the chimneypiece,
with initials J. R. Is the room to the
right of the entrance on the ground floor is
another Royal arms and supporters of extremely
spirited execution. Another of the beauties
of Ludlow is the Elizabethan Reader's House
in the churchyard, which is now open to the
public after having served for some years as a
warehouse. After 1689, when the Council
of the Marches had been abolished and the
castle was allowed to fall into decay, the
importance of Ludlow began to decline, but
throughout the XVIIIth century it remained
a sort of local metropolis, with its regular
season during which the county families would
go into residence as they now go to London.
The town abounds in examples of quiet brick
buildings of XVIIIth-century date, as in
Broad-street, at the bottom of which is Broad
Gate looking towards Ludford Bridge. This is
the only one of the old town gates remaining
and is much built up with later erections,
though its original form is distinguishable on
the outer face.

Fifth Day—Friday.

Plais Hall was distinctly the success of the
excursion—or would have been if the rain had
not inopportunately descended to the confusion
of sketchers. Stone and half-timber had been
seen in plenty, but here was a brick house
glowing with mellow colour and excellently
kept. Parts of the house, and probably con-
siderable parts, date from the XVIth century,
the original licence to build having been issued
by Henry VIII. in 1520. It was, however,
remodelled by Judge William Leighton, one of
the Elizabethan Council of the Marches and
Chief Justice of North Wales, who died in
1606. Neglecting later additions which are
inconspicuous, the house is a symmetrical
H plan, the hall occupying the whole of the
link, with ranges of rooms to right and left and
circular newel stairs of solid oak in turrets at
the opposite angles of one court. These turrets
now rise above the main roof and are capped

by ogee cupolas, while the court between them
is filled in with outbuildings. This work
dates from a restoration carefully done in
1885, previous to which the house was occupied
as a farmhouse. A sketch in an anonymous
work, published at Shrewsbury in 1868, shows

Balastrade Panel Welsh Hall.

the stair turrets carried no further than the
first floor and the court free (as the one on the
other and original entrance side still is).

Internally the chief interest is in the hall,
which retains its screens in the original position
—though remodelled—with a gallery over, and
also has a curious rooflike construction sup-
porting the topmost floor. A ceiling with
similar moulds to those at Wilderhope exists
in one of the rooms. But the beauty of the
house is in its form and colour—the wide-
jointed brickwork, with continuous diaper
of dark-enders, stone quoins, and mullioned
windows, boldly outstanding chimneys on the
external walls with lofty chimney-shafts of
moulded brickwork in ever-varying patterns,
old roof of stone slates, and brilliant gardens
recreated. The sun was the only thing re-
quired to perfect the picture.

After a stay of about an hour the party left
for Preen, where to a small XIIIth-century
church a large house has been attached by
Mr. Norman Shaw. The house was built in
1870-2 for the late Mr. Arthur Sparrow,
replacing the former Manor House, which
occupied the same position. It exhibits many
of the points which made its architect famous.
His favourite disposition of the lofty principal
rooms above a low ground story in which is
situated the entrance hall, with spacious stone
stairway to the upper hall, is well devised to
suit the levels of the ground, allowing a vista
from the dining-room at the south of the house
to be prolonged through its whole length
and along the upper terrace at the north end.
Mr. Shaw's Royal Academy drawing of the
design is preserved in the house. This house is
pioneer work and must be judged accordingly
but it is impossible not to feel that, however
good it is, we of the present day are able to
call to our aid more able craftsmen than were
available at the date of its erection.

The small church at Preen—practically a
complete work of about 1225—was a dependent
cell of Wenlock, and its aisleless "nave,"
70 ft. long by only 12 ft. 9 in. wide, was divided
into monastic choir and parochial nave. It has
a graceful triplet of lancets at the east end
and a low-side window facing north, curiously
recessed internally on either jamb, apparently
for the contrivance of seats in the common
manner of domestic work. A Jacobean pulpit
and reader's desk, the latter dated 1646, with
the initials I. D. * 2, stand on either side of the
chancel.

Langley, the next place visited, provided
in its desecrated chapel and ruinous gatehouse
material for sketchers of which they were not
slow to avail themselves. The chapel, about
48 ft. by 16 ft. 9 in., is extremely interesting
as an example almost completely of the Jaco-
bean period, preserving the original seating
intact. It is a simple little building, rather
uninteresting externally, but its internal
arrangements, and particularly the seating of
the east end, are very noteworthy. The altar
table stands detached, and benches with book
rests surround it, lining the east and north
walls, and formerly (it is stated) the south
also within the chancel, which is marked by a
step. Immediately west of the step on the
north side is the covered squire's pew,
next to which on both sides of the central
passageway are closed pews for the gentry,
with rude benches westward for the common
folk. The chancel is covered by a moulded
trussed rafter roof, and the nave by a roof
with arched principals, of which the most

HOUSE IN
BUTCHER ROW
SHREWSBURY.

easterly is dated 1601. It may be hoped that so unusual a building will not be suffered to fall into complete decay, as it now threatens to do. Langley, now a farmhouse, was the seat of the Lees until 1660, and from this family descended the famous Confederate General Lee, who commanded for the South in the American Civil War. The book of 1968, previously alluded to, shows more extensive buildings than now exist, all that remains being a stone archway with rooms on either side and a rubble wall, continued for a short distance northward, which is said to date from the reign of Henry VIII. (but looks earlier), raised in Elizabethan times and presenting, above, a front of good ashlar with two gables on the outer face, and upper stories of half-timbering next the former courtyard. It may

be worth mention that the extreme thickness of the plaster panels from outer to inner face of these walls is only 3 in., though the main timbers are 6 in. The last place on the programme was Pitchford, where members were allowed the free run of the house, and by the further kindness of Lieut.-Colonel Cotes were entertained to tea. Pitchford Hall is celebrated as the finest half-timbered house of Shropshire; it is certainly the largest, and a very splendid example, but one feels that, charming as this magpie work may be when it appears, as at the porch of the Reader's House, Ludlow, or the gatehouse of Stokesay, relieved against a background of stone, the continued sparkle extending round all sides of a large courtyard is rather overpowering. Pitchford Hall is said to have been built by William Otley,

Sheriff of the County, in 1475, but suggests a rather later date. A plan in Garner and Stratton's "Tudor Architecture," and shows the disposition on the E form, with small gabled in the internal angles of the court staircases. The detail is similar at Allbright Hussey and many houses in Shrewsbury, though, bracing is on the whole simpler, freedom from curved or shaped. Some early photographs preserve the house show the buildings in a very condition to their present state, windows being sashes and one of them being disfigured by a mean brick. It has been extended as well as reformed state, the only point in which materially being in the proportion casements, which fill the opening occupied by the sashes—considerably in area than the original window to have been—on the upper floor they had their sills at the level of the ground. Throughout the 400 years of its history the house has only once changed out of the ordinary course of development. In 1807 it passed to the Earl of Grandfather of the present owner, a series of portraits and some fine fills the house—paintings of the Earl of Liverpool, by Sir T. Lawrence and Admiral Cotes, by Sir Joshua Reynolds; John Cotes, by Hoppner; Mrs. L. Sir G. Kneller; and others of Prince Sir Francis Otley all being none of the interior panelling is modern drawing-room, which has the Prince Rupert over its chimney original work resembling that in Stokesay, and the library has a panel bearing the date 1626 with initials M. O. The greater part of the work at Pitchford Hall was carried out some ago most skilfully by George Devereux.

The church of Pitchford somewhat green, but the chancel suffered in 1719 and again in 1819. Eytton, historian, records that "a certain Pycheford, Radulf by name, but at Pycheford, procured it to be presented Eugelard his own house to." Erect in the chancel are four incised slabs to members of the Otley late mediæval and early Renaissance very remarkable oak altar tomb with knight, said to be Sir John Otley 1285. It is of immense size, though 8 ft. long and in good preservation. Pitchford the excursionists returned to Shrewsbury, the last day's counting being over.

Sixth Day—Saturday

No organised programme of various interesting buildings was attempted, as the party had to break up, but those members devoted the forenoon to an examination of the more interesting many old buildings. The fine Shrewsbury is undoubtedly St. Mary's, a collegiate foundation, built in its XVth-century belfry stage and it is not externally imposing owing to homogeneity in the way that various periods comes together. The archway is of remarkable size, ever, its piers and capitals belong to type which, since the publication of a fine book on "Gothic Art," it has been recognised as Western Gothic. It has been placed as early as 1160-70. The glass in the church, mostly dating of the XVth century, but the at the east end (restored) was the east window of old St. Chad.

If St. Mary's suffers from condition, this is even more so in Abbey Church, of which the remnant of the monastic building being due to its parochial church of the parish of St. C. choir and transepts have been by Mr. Pearson, and the nave which had been destroyed, is though the tracery and glazing inserted in the triforium has to remain. The south aisle has a level parapet, though interspersed below the series of transverse gables it is roofed are still apparent; the ment is intact on the north side.

had two towers in line (as at Ely), the western one remains, and that of the 12th century, though the west doorway is of the Norman nave. The two towers of the nave are coeval with the choir, and it is a curious and not altogether unimportant feature that the clearstory is placed along the sides of the tower, which, with a huge west window inserted in the 14th century, gives it a highly substantial appearance. The modern London-road crosses the site of the monastic cloisters and severs the church the only other considerable remaining—the beautiful XIVth-century pulpit from the refectory wall—the loveliest of a lovely series.

The tower of St. Alkmund was rebuilt in the 15th century, its XVth-century tower being replaced by the new church then built on another site above the quarry. The design is remarkable; it has a circular tower with a gallery and pews concentrically placed, a western tower and portico, with a vestibule between it and the nave.

St. Julian's, rebuilt in 1749, also has a 15th-century tower. Old St. Chad's, after the fall of its central tower in 1831, was replaced by the new church then built on another site above the quarry. The design is remarkable; it has a circular tower with a gallery and pews concentrically placed, a western tower and portico, with a vestibule between it and the nave.

St. Mary's Castle was built originally by the Montgomerys across the narrow neck of land where the wide loop of the Severn flows past its protected site. The tower existing is chiefly Edwardian, and was used as a private residence. The tower of Shrewsbury is a town and a castle, the surrounding country reached by a bridge in the XVth and XVIth centuries.

The tower of Henry IV., to whose usurpation the tower gave early adherence, its importance continued to increase. There are many examples of half-timber houses in the XVth century date, one of which is shown on page 228. The richest detail of the XVth century is shown at the house of the Earl of Richmond, where Henry of Richmond (1485) only a portion is exposed but further equally rich work is doubtless beneath later plastering.

The tower of Shrewsbury is a town and a castle, the surrounding country reached by a bridge in the XVth and XVIth centuries. There are many examples of half-timber houses in the XVth century date, one of which is shown on page 228. The richest detail of the XVth century is shown at the house of the Earl of Richmond, where Henry of Richmond (1485) only a portion is exposed but further equally rich work is doubtless beneath later plastering.

Shrewsbury buildings better known are the "Anchor House" (1896) on its pillared stump, columns (measured drawings in the Architectural Association Book, Vol. XI.) and the School now used as the Library and Museum. The members of the party dispersed at day afternoon, in agreement that,

notwithstanding cold and showery weather, one more success had been added to the long list of excursions arranged by Messrs. Talbot Brown and Hennings, the Honorary Secretaries. Thanks must also be recorded to Mr. Shaylor, F.R.I.B.A., of Shrewsbury, who rendered most kind assistance during the first three days of the excursion.

THE SUMMER SCHOOL OF TOWN PLANNING AT HAMPSTEAD GARDEN SUBURB.—II.

THE Town Planning Act and other legal aspects of the subject were dealt with in a series of three lectures by Mr. E. A. Abbott, the Clerk to the Urban District Council of Ruislip and Northwood.

His interpretation of the Act and its application was of a special interest from the exceptional practical experience in the working that he has gained in the preparation and negotiation of one of the first schemes under the Act. We can only touch a few of the points of special emphasis, difficulty, or criticism raised by Mr. Abbott. To start with, the Act has no definition of a town-planning scheme—a fact which a former lecturer said he had discovered to his cost. Nor does it define the term owner, but Mr. Abbott says probably the definition in the Land Clauses Act can be taken that an owner is a person entitled to convey.

The kind of district for which a scheme is suitable is a growing district. As to the amount of land to be included, Mr. Abbott advises too much rather than too little; experience, he says, shows they might at Ruislip very wisely have included more. Also it is well to make good use of sect. 54 (3), referring to land already built on, and include old houses standing in a lot of land, old cottages; in fact, all likely to be pulled down and rebuilt within a measurable period.

The first notice Mr. Abbott considers the most important of all, and that it is desirable to serve the map with it; also that it is of most vital importance to prepare, whatever the trouble, an accurate plan and schedule, including every holding with its owner and occupier. To avoid unnecessary objections and delays more need not be said about the scheme at first conference than is absolutely necessary. The principle of the Act is co-operation and agreement, but the principle of compulsion is also in the background. Mr. Abbott has found that, with few exceptions, satisfactory arrangements can be come to with landowners, even where at first hostile, and even on such a point as limiting the number of houses on the acre to eight. There is likely to be some opposition with traffic roads, and especially where landowners are hostile, it is well to show as few roads as possible beyond what are clearly necessary, and for the rest rely upon carefully-drawn provisions in the scheme. The question arises as to how far a town plan can be modified without going to the Local Government Board, and Mr. Abbott suggests giving the responsible authority limited powers to modify by agreement with landowner and developer. All open spaces and all land required for sewerage works, destructor, etc., should be appropriated at outset. Land purchasable by the local authority will probably have to be paid for on approval of the scheme.

Necessary definitions should be in the scheme itself and not by reference.

Coming to the question of the number of houses to the acre, Mr. Abbott considers a strong stand should be made for a maximum of twelve. If a man gives up part of his land for open space, he might be allowed to put a greater number on the rest, say up to twenty per acre. A man owning 10 acres, for instance, is entitled to erect 120 houses; but if he undertakes to keep 6 acres open he might build eighty on the other 4 acres, and if he chose to do so at a future time, forty more on the 6 acres left open. The principle of the "land unit" provides against those conditions being disturbed by severance or otherwise. Mr. Abbott discussed the several proposals for the land unit at Ruislip and Birmingham and elsewhere. At Ruislip it is proposed that not more than one quarter

of the area of plot shall be covered by buildings in the case of dwellings, or more than half in the case of shops, and, with more than eight to the acre, buildings shall not be more than two stories high, and another in roof. Private open spaces, if so secured, are as good as those actually given up, and there is no public expense of upkeep.

The question of provisions is still *sub judice*, and the Local Government Board have not yet laid their general provisions before Parliament.

Mr. Abbott thinks local councils might be allowed to interfere with regard to external elevations, etc., with an appeal to a referee appointed by the Royal Institute of British Architects. We doubt whether such a proposal would appeal to architects or their clients.

It will augur well for the success of the Town Planning Act and of the movement if the legal officers of local authorities generally will tackle the subject with the enthusiastic thoroughness and goodwill of Mr. Abbott.

Mr. W. R. Davidge, F.S.I., A.R.I.B.A., A.M. Inst. C.E., gave two lectures on "The Surveying and Engineering Functions and Problems of the Town-Planner from the Municipal Surveyor's Standpoint."

He dealt in some detail with the survey and setting out of contours, gradients, and property boundaries, with the planning and construction of the sewerage system, explaining the advantages of the dual system, methods of alignment, laying and testing, with outfalls and sewage disposal works, and also with house drains. He went into the questions of water supply, wells, and streams, head of water for fire prevention, reservoirs, street watering and maintenance. He dealt thoroughly with roads, from preliminary levels and selection of route to lighting and the requirements of local authorities previous to the adoption of a new road, describing materials and methods of road-making and paving, footpaths, tree-planting, the laying-out of roadside spaces, public squares, etc., and the allocation of sites for various municipal and public uses. He also dealt with street traffic, tramways, and motor traction, and with modification of by-laws.

Mr. Davidge remarked that a thorough preliminary study of the ground is essential; and the scheme must be evolved with continual regard to all the above essential details.

He very aptly illustrated and emphasised his points by reference to the premiated competition plan for the Federal Capital of Australia. By means of a most interesting model of the central part of the site, with the principal roads of the design sketched on, he showed how a geometrical design that looks very nice on paper, and which may have many points of real merit, may yet involve the developer in many difficulties and much cost on so undulating a site.

Mr. Davidge insists—and we are quite with him on the necessity of engineering and architectural problems being considered together from the very outset. If the scheme must, as he says, be evolved with continual regard to its practical necessities, these also, we would add, must be settled with continual regard to aesthetic fitness, or, as the Act puts it, amenity. There is no line between the engineering and architectural problems. Both have in view the same fitness for use and purpose; and the aesthetic fitness, the beauty which the architect aims at, the architectural composition of building with building, and of buildings with the natural amenities of the site, should be but the fine flower and expression of practical conditions well met, and purposes well served, and not a mere decoration superimposed upon a scheme worked out in a purely utilitarian spirit. A more or less conscious recognition of this probably accounts for the fact mentioned in discussion by Mr. A. H. Campbell, City Engineer of Edinburgh, that town planning seemed of late to have fallen almost entirely within the province of the architect.

The function of the municipal engineer seems clear. He has, in the general interest, to see to the provision of main lines of traffic, whether of road, rail, or waterway, and of drainage, and to the exigencies of water supply, and many other practical necessities, but not, save in special cases, to town plan in detail.

The problem of public criticism or control of architectural amenity has yet to be solved.

We now turn to another aspect of the subject, viz., "Town Planning in Foreign Countries and Past Times."

This was taken by Professor S. D. Adshead, F.R.I.B.A., Professor of Civic Design in the University of Liverpool, in a series of four interesting lectures, plentifully and beautifully illustrated by lantern pictures.

Professor Adshead said there were two ways of looking at the town plan historically—(1) As a preconceived plan of ways and buildings; (2) as the outcome and expression of social substructure and growth. There was little of the first in ancient cities. Cities grew from isolated dwellings or from the parcelling out of land to colonists. The well-known gridiron or chequerboard arrangement was not a town plan at all, but merely the dividing up of a site into square lots for valuation purposes. This has gone on in all ages from the Greek colony of Selinus, 600 B.C., to Alberta in Canada, about four years ago. It could not, of course, persist with the developed and complex requirements of later times, and, though still quite evident in some ancient cities, it has more or less completely disappeared in others. In the American cities of rapid growth we see the difficult process of change now going on.

Professor Adshead said the question of formal or picturesque is entirely a matter of character. Both are necessary in their several ways, the first as expression of well-arranged system, essential to grandeur and ceremonial, the latter as an easy, natural human way of dealing with environment.

The parent cities of ancient Greece, as distinct from their individual buildings, were picturesque in arrangement, with narrow, irregular streets—the widest in old Athens was 15 ft.—but balance of parts was carefully studied and thoroughly understood. Note, for instance, the arrangement of buildings on the Athenian Acropolis. The colonial cities were laid out on more orderly and stately lines, and often outdid Athens in scale and grandeur, but not in refinement, being more commercial and luxurious. Professor Adshead, while showing a number of interesting slides of remains and restorations of Greek cities, of temples, theatres, gymnasia, etc., dwelt upon their constant everyday relation to and influence in the life of the citizens. The gymnasium, forerunner of the great Roman Thermae, was a great congregating place, where people went to hear the orators and poets and the arguments of the philosophers, as well as to indulge their ardent passion for athletics and games and for the bath. The virile open public life, where all were in competition and subject to public and even personal criticism, eliminated incompetence; and this was reflected in their architecture and its sculpture, making it the highest achievement of the intellectual artist the world has known. Turning to Rome, we may not follow Professor Adshead in his masterly little sketch of why and how she became the metropolis of the world, and of her social structure and condition. Starting with the Empire, when untold wealth was piling up in her treasures from conquered nations, we must confine ourselves to a few notes on the Professor's remarks upon her phenomenal development as a city of architectural splendour, even in her business buildings, on a scale more huge and grandiose than is easy for us now to conceive. This does not, of course, apply to her extent, as her population was only about a million, and closely packed at that. Professor Adshead confined his remarks to the Empire period, though, he said, Rome is architecturally interesting in at least four other phases.

The main ways followed the valleys between the seven hills. The oldest and greatest centre was the Forum Romanum, with the Capitoline on the one hand, with its great Temple, the stronghold of the spiritual power, and the Palatine on the other, with its palaces of the Emperors, the temporal powers. At the Rostrum in the Forum public votes were recorded, laws promulgated, announcements made, great lawsuits argued. In the Forum also were shops, banks, and exchanges. Earlier it had been the market place, and the scene of gladiatorial fights, but these had been relegated to other fora, and the Colosseum or Circus Maximus Professor

Adshead spoke of the huge Thermae of Caracalla and many others, in which as many as 3,000 people bathed free at one time, also of the insulae, or island blocks of the ramshackle, crowded dwellings of the people, which, as to-day, were the source of rich profits to speculators. The streets were usually 17 ft. wide; the widest was 22 ft. But, while the framework of Rome was irregular, the Romans were intensely formal in all their building schemes, adapting natural contours and carving hills to their devices.

Alluding to the country villas of Pliny and others, Professor Adshead pointed to the similarity in many ways of the life of Rome of the Empire to modern life. Her art was mainly the work of Greek artists, and thus did "captive Greece lead captive her captor Rome."

After the Dark Ages following the fall of Rome the cities of Europe were under the dominance of grand seigneurs or magnates of the Church, sometimes both; and Professor Adshead traced in the rise of the citizen and trade and the decline of the magnates the development of two notable groups of cities—(1) The great Republican cities of Italy, and (2) the cities of the Hanseatic League along the Rhine Valley to the Baltic, and in the low countries and England. The security of Rome was gone, and fortification was the necessary and dominant factor of lay-out in mediæval towns. Trade and fighting were the two great industries, not only against foreign foes, or citizen against magnate, but also citizen with citizen for lack of better; and towns were often as thick with refuge towers as the modern industrial town with factory chimneys. Street lines were often strategic, and, again, they often followed the winding course of the rural ways from the gates, as new lines of fortification encircled the old. In the XVth and XVIth centuries fanciful, conventional town plans began to be drawn, based upon the increasing intricacies of fortification.

With the Renaissance formal symmetrical arrangements began, often of great splendour, like the Piazza del Popolo or Bernini's piazza in front of St. Peter's.

Professor Adshead devoted some time to the gradual formalising of mediæval Paris, from the creation of its great palaces and places by Louis XIV. and other monarchs, the work of the Commission of Artists appointed in 1794, and of Napoleon, to the demolitions and reshaping of its streets by Baron Haussmann.

He also touched on the reconstructive works of German Princes, as at Mannheim, Carlsruhe, Wiesbaden, etc., and on the copied beautiful town planning of Nancy, and finally mentioned Covent Garden, by Inigo Jones, as the first piece of town planning in England.

In America, Professor Adshead says, town planning is now consciously turning from grandiose schemes of city embellishment to improvement of the conditions in which the mass of its city dwellers live. Taking New York as typical, he said those conditions were frightful congestion and terrible municipal arrangements. He described the great residential blocks ten stories in height, in which out of 100,000 tenements some 10,000 draw light and air from narrow enclosed areas only. On the other hand, he did not see the terrible poverty so evident in Europe. Now, however, there are great schemes in all the big cities to spread the inhabitants over the outlying areas and increase the park lands and playgrounds for the people.

In another picture of New York Professor Adshead depicted its unique site, its wonderful atmosphere, where the use of soft coal is absolutely forbidden, its immense wealth, the huge scale of its lay-out, and the grandeur, magnificence, and costliness of its buildings, in which it approaches ancient Rome more nearly than any other modern city. No city is more regular in plan, and yet no mediæval city is more irregular in effect. Its skyline is ragged, and there is no grouping.

The Professor referred to other big cities and their schemes, notably Washington, Chicago with its great scheme on paper, and Boston with its more practicable scheme; also to the great idea of the Park-way, already tackled by dozens of towns; and finally to the manifold suggestive charm of old American colonial towns.

A most interesting lecture by Herr Langen, Assistant Secretary of the Town Planning Exhibition, on "Towns of the Future," described it as having survived diseases, each of which was awarded a first prize in its time with (i.) the conventional juvenile disease, passing into gonorrhea, which degenerates into the diamond disease, when the thing of Paris and Cologne was in vogue; (iv.) next the block or disease congenital in survivors, a line bacillus is common to all this developing curving symptom worm disease set in, with its wriggly-curved streets everywhere of sensations on a rough squeaking of unrolled tram curve more severe reaction comes (vi.) disease, with its obsession of patterns of ladies' needlework. Length common sense begins to be no beautiful and fitting garb measurements are taken from the new feature is scientific investigation conditions and phases of the town to collect and compare data on to arrive at a uniform way of action, and a technical phraseology establish permanent museums of This idea is to be forwarded at International Building Exhibition to which Germans hope to draw a large number from England.

Herr Langen illustrated his reference to plans prepared for Dusseldorf Competition, in which the author of the design placed three problems. He showed the first traffic roads, and its filling in, curved, formal or informal, generous, in accordance with conditions of each part. There is no development on one method of Mr. Raymond Unwin, in his but one, took up this matter of framework of roads and its fill. Roman camp, he said, was of the gridiron plan, with its streets crossing at right angles. This type is seen again in the XIth planned towns of the Garonne, the late XVIth and early XVIIth ideal town plans began to be made by Scamozzi, and others with all directions, even the river being parallel, but exhibiting great departure from the gridiron plan. Others show arrangement, but with diagonals the influence of fortifications and city of rapid movement from point. Following this comes the spider web with main and secondary radii from centre, and with many common square with the former.

Penn's plan for Philadelphia on gridiron system, but with centre and parks. Washington really planned modern town, is superimposing a gridiron plan on work of diagonals; Chicago, of setting a diagonal frame on a gridiron monotonously grown without for hence giving rise to all sorts of junctions and cutting-up of right method is to begin with subsidiary centres and other emphasis, and then lay down the work and fill in details in relation to part.

In his last lecture, speaking of individuality of towns, Mr. Unwin Rothenburg as a town of nature. Situated on a plateau above the Rhine its completely walled outline is dictated by exigencies of fortification, hardly a definitely square angle line about it, yet it has a clear sense of proportion between parts, walls of cream-tinted stone or roofs of deep, rich tiles, and shutters of bright green produce variety harmonised in a general unity.

With this Mr. Unwin contrasted a formally-planned town on fair with streets, in the original plan away from the dual palace at It is full of pleasing architectural pictures, in which perhaps the

GENERAL NEWS.

Professional Announcement.

Messrs. William Sprowson & Son, of Constantinople, have been appointed architects for the first three principal exchanges of the Constantinople Telephone System, the exchanges being situated in Stamboul, Pera, and Kadiköy.

The Royal Sanitary Institute.

For some time the Council of the Royal Sanitary Institute have been urged to arrange an examination for smoke inspectors, and they have now decided to establish an examination in this subject. The syllabus includes those subjects with which it is necessary that smoke inspectors should be cognisant in order satisfactorily to carry out their duties, and a practical as well as theoretical knowledge of the administrative duties is required.

A Memorial to Miss Cons.

A friend of the late Miss Emma Cons has willed the house, Chippens Bank, Hever, Kent, and 26 acres of freehold land, to the nation in memory of Miss Cons. The house is now in the hands of the National Trust, and it is understood that the owner has endowed it. Chippens Bank is about 200 years old.

Maiden Castle.

At Dorchester recently Messrs. Whatley, Wing & Bamford offered by auction, on behalf of Lord Alington, his Dorset estates of Woodford Manor, Forston Grange, and Marinetown, aggregating 3,680 acres. The chief interest of the auction, says the *Times*, was in the offering of Maiden Castle, the largest and finest earthwork of its kind in the country. It is attributed to the Bronze or late Neolithic Age, and comprises about 107 acres of pasture, let to a farmer at 53*l.* a year. Mr. Alfred Pope, Fellow of the Society of Antiquaries, inquired what restrictions would be imposed on the user of the property. The auctioneers produced the document wherein, over four years ago, Lord Alington, under the Ancient Monuments Protection Act, 1882 and 1900, appointed the Commissioners of Works as guardians of the Castle for the purposes of the Acts, and the Commissioners accepted the guardianship. The Commissioners, the auctioneers said, undertook to keep up the fences. Mr. Pope pointed out that the fences were not kept up, the Commissioners' notice-board was lying on its face, and nothing appeared to have been done for the preservation of the place. The property was started at 1,000*l.* and rose to 1,425*l.*, at which it was withdrawn.

The Preservation of Linlithgow Palace.

For the past two months work has been in progress at Linlithgow Palace, under the direction of H.M. Board of Works in Scotland, and much work has been done in buttressing and protecting the ancient building. The work being carried out has been directed to the part known as the King's Kitchen and parts connected therewith, also the doorway or porch leading to the quadrangle, and at other parts the pointing of walls and renewal of decayed portions of the building has received attention. The operations have been in charge of the Government Department itself, which has employed local labour.

CORRESPONDENCE.

The Monumental Mason.

SIR.—Your article on "The Monumental Mason" was timely, and pleasant reading, too. However simple a gravestone may be, it may, and should be, worthy of real artistic expression; it may at least have good lines and good proportions; if good ornament is debarred by cost, the art of "what to leave out" may at least be included in. No sculpture is preferable to bad sculpture; sham and meretricious ornament is both costly and offensive. The true monument should be a memorial of the dead, and not as an advertisement of the name of the maker. I have always made a strong point in resisting this, not only because of its unseemliness and vulgarity, but because of its

dishonesty; an advertisement "on the cheap," and certainly in the wrong place; often used on what should cause shame rather than acknowledgment. E. SWINFEN HARRIS, F.R.I.B.A.

The Single Tax.

SIR.—Personally, I do not think the "Single Tax" theory is at all likely to make much headway, but I am convinced that there is much to be said in favour of taxing land values. The present system would be considered farcical were it not staled by custom. It can be matched in every town in the country and in thousands of instances, but I am speaking from my own knowledge. A certain business outgrew its original premises, and larger ones had to be sought. A suitable site was available. Although within the borough boundaries, it was rated as agricultural land and paid, as such, a merely nominal sum towards the upkeep of the town. It was purchased at a figure running into hundreds of pounds per acre and new works erected. As a penalty for adding to the wealth of the locality and providing remunerative labour for some of its inhabitants, the local authorities promptly clapped on a rate to the full value. A year or two after, the business having increased, the same landowner was approached with a view to purchasing more land. His price was now 50 per cent. higher than at first, but the land was purchased and the local authorities behaved as before. Notwithstanding these handicaps, more land was, shortly after, deemed to be a necessity, and the price was again raised; its value, in the opinion of its owner, having just doubled in five years, and this without his having spent a penny upon it; the local authorities meanwhile being content to rate it as of the value of agricultural land. Now . . . by the laws and customs of this country, the landowner was enabled to take toll of the necessities of industry and place a permanent burden upon a promising business that, when hard times came, was found to be a severe handicap. Is not one compelled to advocate some alteration in the law that makes such things possible? Land is not a mere commodity. It is as indispensable to all industry as the daylight or the atmosphere, and should never have been allowed to become private property.

The scheme for taxing land values seems to open out a way of remedying, to some extent, this unjust state of things and, far from inflicting injury on the building trade, I look for enormous improvement as soon as it is made effectual. Most certainly, if a tax of only a few pence in the pound were placed upon the enormous site values in the wealthier parts of London and other large towns, very many of the obsolete buildings that now encumber these sites and disfigure localities would at once be demolished, and worthier ones erected to take their places, to the great benefit of the building trade. I do not think that the ruthless expropriation of the retired tradesman, doctor, widow lady, and fatherless family, so feared by Mr. Chorlston, is at all likely to take place. What has to be paid by them in a tax on land values will be more than recouped by the saving in rates; besides, those who advocate this new departure are, after all, English. As to faith in the stability of our institutions, surely this is likely to be increased rather than be shattered, if the said institutions are based upon justice as well as common sense and common honesty. WM. F. WALLIS.

Marsden.

The College Gateway, Worcester.

SIR.—In your issue of August 16 is a statement to the effect that "conjointly with Mr. W. H. St. John Hope, Mr. R. F. Wells designed and executed in terra-cotta" a series of figures that has just been set up on the College Gateway at Worcester.

Will you please allow me to state that I am not in any way responsible for the new figures, and that my name ought not to be associated with that of Mr. Wells as having acted "conjointly with him in their design or execution" in any way?

I did give Mr. Wells some amateurish help, at the earnest request of Canon Wilson, in converting his clay models for friars into their more proper guise as Benedictine monks, and I pointed out to him certain inaccuracies of episcopal vestments which are still conspicuous in the finished terra-cotta figures, but that is the whole of my "conjointing."

W. H. ST. JOHN HOPE.

predominates; and again the combination of cream-plastered walls, grey-slated roofs, and brightly-coloured woodwork produces a clear individuality of effect, comar variety in harmony, but this time by a system and style completely from the first instance.

Unwin contrasted the successive town-schemes for Cologne—the first with right lines and star-shaped places, and not too pleasing; Camillo Sitte's system, with closed places and fine pictures, but absence of frame. This feeling is still more marked in the plan and others. Contrast with which, where irregularity of detail is with strong sense of frame.

An architecture, recovered from its "disease," is developing a style in their old Renaissance of great dignity and dignity, which is forcing the more regular lines.

Unwin showed a number of views of cities—Lucca, Rheims, Nantes, Genoa, etc., illustrating various treatments and charming combinations in street plan; and of Turin, showing the beautiful planning of buildings in the town, and the mountain, and river beyond. Unwin, too, to the view of Ephesus, and the splendid treatment of laying out the most of the hilly site and beauty of scenery, Mr. Unwin said in combinations like these, fulfilled all practical requirements and was, that the ideal of the town-planner's

general walks round the suburb Mr. demonstrated many of the points of in his lectures. Visits were also to Hampton Court, Westminster, Letchworth, the London County Council housing at Tottenham, the London squares, and so on.

Edward G. Culpin, Secretary of the Cities and Town Planning Association, delivered a lecture, entitled "Examples in City Estates," on the first morning of the course. Unable through accidental circumstances to place it in its proper order, it took a position of even greater vantage, may have the last word. We do so Mr. Culpin lays special emphasis on it of the subject which was at least upon by practically every other speaker, namely, the sociological aspect, of utmost importance, especially to practically concerned as architect, surveyor, and engineer. However beautiful may be made with public buildings, streets, and open spaces, if towns do not provide for a better home for the worker and opportunities for a fuller life for himself and his family it fails in its object.

Culpin sketched the growth of model towns from earliest times, showing examples of schemes projected by Robert James Buckingham, Moffett, and others in the early XIXth century. Some interesting particulars of these were given by a complete series of lantern views, experiments so far made in this as a result of the Garden Cities and Town Planning Association.

Finally Mr. Culpin spoke of the housing of the workers at the new naval base at Portsmouth. He thought it deplorable that a Government which had the Town Planning Act should neglect at opportunity to create a new model town.

He could contrast with this the great dock at Frankfort-on-Maine, with its suburb and parklands for the workers. And we would remind the shy folk of the beginning of our article that our German friends are bimetallists; they are wide awake to all costs, and what it is to pay.

Free; it is deplorable, and some other like it. It is to the credit of the town-planning movement that it had taken in the movement to provide houses and conditions of life for the workers. But if the Government that passed the Act neglects an opportunity to set the example to be wondered at if local authorities, often with the dead weight of interests to hold them back, do not the running with more ardour?

ILLUSTRATIONS.

Sketches with the Architectural Association.

THE excursion of the Architectural Association was made this year to Shropshire, the headquarters being Shrewsbury, and the whole of our inset plates this week are devoted to illustrations, made from sketches by Mr. Sutton Wood, of buildings visited, and an account of these and other buildings will be found on p. 224.

MEETING.

SATURDAY, AUGUST 31.
The Institute of Sanitary Engineers.—Northampton centre. Arrangements have been made for a visit of members and friends.

COMPETITION NEWS.

A list of current Competitions is printed on page 242.

Huddersfield Town Planning Competition.

The Secretary of the Royal Institute of British Architects asks us to state, for the information of Members and Licentiates, that the Competitions Committee are in communication with the promoters of this competition with a view to the amendment of the conditions.

Constables' Houses, Ayr.

Members and Licentiates of the Royal Institute of British Architects are informed that this competition has been vetoed by the Glasgow Institute of Architects on account of the unsatisfactory nature of the conditions.

MAGAZINES AND REVIEWS.

In the *Burlington Magazine* Mr. Lionel Cusp writes of the sculptures of the Parthenon. The Elgin marbles were purchased for the nation in 1816 at a cost of 35,000*l*. It is curious that the artists gave conflicting evidence to the Committee appointed to decide as to the purchase of the collection, for whilst Benjamin West, who was then President of the Royal Academy, was enthusiastic and set their unique beauty above pecuniary assessment, Richard Payne Knight, a leader in the amateur art coterie of the day, condemned them as less in rank than the Laocoon and Apollo. A century has vindicated Benjamin West's taste. The occasion of Mr. Cusp's article is the publication of "The Sculptures of the Parthenon" by A. H. Smith.

We mention this article chiefly because of the mere presence of these sculptures in England to-day. Why are they here instead of in Greece? For ourselves we are grateful to Lord Elgin, but his memory is equally execrated in Athens. Has anyone written on the morality of removing sculpture from existing monuments?

An article, translated from the German of Willy F. Storck, on "Aspects of Death in English Art-Poetry" also appears in the *Burlington*. If a certain youthfulness and joyousness may be observed in mediæval life, "Death appears and pronounces admonitions to cherish the soul's health." The article is illustrated by several illustrations of gruesome aspect, and should be interesting to the mind of the antiquary and historian. Most of the paintings were intended to produce a didactic effect on the faithful, and thus had other than artistic ideals. But these "aspects of Death" also found expression in stone on our cathedrals—often forceful and terrible as didactic work must be. The study of these "aspects" is useful to temper the too sweetness of Tennyson's or Morris's mediævalism.
